Executive summary

Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) outlined in the PFAS Management Area Plan (PMAP) (Department of Defence, 2020) at the Royal Australian Airforce (RAAF) Base Townsville (the 'base') located Townsville, Queensland.

This Ongoing Monitoring Interpretive Report summarises the results of the monitoring undertaken over the period between December 2020 and May 2023. The scheduled sampling events were completed in April 2021, October 2021, April 2022, October 2022 and April 2023, with rain event sampling completed in December 2020, February 2021, January 2022 and April 2023. This report provides interpretation of changes that have occurred during the reporting period.

This Ongoing Monitoring Interpretive Report has been prepared in general accordance with the Defence *PFAS OMP Annual Interpretive Report Guidance* (Version 0.4) issued in October 2022 (Defence, 2022).

Objective

The objective of the monitoring program set out in the OMP is to provide information on changes in the location and concentrations of PFAS on-base and off-base within the management and monitoring areas outlined in the PMAP (Department of Defence, 2020) and as depicted in **Figure F1, Appendix A**. Locations which are monitored off-base are located within the Monitoring Area, depicted in **Figure F1, Appendix A** as a pink outline.

The data is required to assist risk management decisions by Defence and State Government agencies to protect human health and the environment.

Monitoring program

AECOM completed periodic monitoring of groundwater, surface water and sediment in accordance with the sampling and analysis quality plan (SAQP) (AECOM, 2023a) from December 2020 to May 2023 (hereafter referred to as the monitoring period). Monitoring events were completed during December 2020, February 2021, April 2021, October 2021, January 2022, April 2022, October 2022, and April to May 2023. The monitoring targeted PFAS and included selected locations on-base and in surrounding off-base areas. The limits of the base form the RAAF Townsville Management Area, as shown in **Figure F1, Appendix A** including Sub-Management Areas related to PFAS sources. The three Sub-Management Areas are:

- Sub-Management Area One: Former Fire Training Area.
- Sub-Management Area Two: Former Fire Training Area.
- Sub-Management Area Three: 5 Aviation Regiment (5AVN).

The Monitoring Area is defined as the base surrounds including the Townsville Town Common Conservation Park, the Bohle River, and portions of the suburbs of Pallarenda, Rowes Bay, Belgian Gardens, Garbutt, West End, Mt St John, Bohle, Burdell and Bushland Beach.

Interpretive assessment

Data collected during the monitoring period were compared to historical data. The ongoing monitoring program data are consistent with data presented in the detailed site investigation (DSI) (WSP, 2018b).

Overall, the groundwater monitoring results do not suggest a change in the understanding of contamination or risk at the monitored locations. The relative stability of the concentrations during the monitoring period within each of the sub-management areas suggests the plume geometry, particularly the lateral extent is unchanged. The PFAS plume in groundwater across the base and extending off-base has also remained consistent with historical extents and generally within the same order of magnitude as historical results.

Some wells within Sub-Management Area One have been destroyed due to remediation activities and present gaps in the data set. Prior to decommissioning, new historical maximum concentrations were reported at MW126. Following the remediation of this area in 2022/2023, concentrations at downgradient wells MW118, MW026 and MW033 have been generally decreasing for the last three monitoring rounds when compared to pre-2022 data. Further monitoring will be required to assess if this is an ongoing trend.

Sub-Management Area Two has historically reported the highest concentrations across the base. The new maximum results reported at MW138 and MW109 and fluctuating concentrations at other wells within Sub-Management Area Two indicate that further monitoring and investigation combined with remedial actions are required to address the PFAS sources in this area. It is also acknowledged that this Sub-Management Area is identified for remediation works during 2023.

Concentrations of PFAS in groundwater at Sub-Management Area Three are stable with MW248 displaying varying concentrations in line with seasonal changes, i.e., higher concentrations following the wet season and lower concentrations following the dry season. Concentrations of PFAS in other on-Base wells were stable with MW255 (located near the western Base boundary) exhibiting decreasing concentrations since 2018. The plume extent for both on and off-Base wells appears unchanged and within the previously identified extents. Concentrations of PFAS in off-Base well MW262 reported an order of magnitude increase in the latest results in April 2023. Concentrations of PFAS in other off-Base wells were generally consistent with historical results. Minor increases in concentrations over the previous maximums are within the expected variability.

Concentrations of PFAS in surface water and sediment during the monitoring period have fluctuated with the seasons and have remained consistent with historical data, though some observations of increasing concentrations have been noted in surface water and sediment, particularly within the Mundy Creek Catchment which reported nine new historical maximums in April 2023, compared to two new historical maximums recorded for each of the other two catchments – Three Mile Creek and Bohle River/Louisa Creek/Town Common Catchments.

Conceptual site model and risk profile

The conceptual site model was reviewed, and no changes were identified to sources, pathways, or receptors at the base or within the Monitoring Area.

The data collected during the OMP over the monitoring period suggest that the risk profile to human health and ecological receptors within the Management Area is unchanged, based on the following conclusions of the data assessment:

- Groundwater PFAS concentrations are relatively stable.
- The overall PFAS plume extent has not changed significantly compared to historical results.
- Off-base well MW262 had a new exceedance of screening levels for drinking water in April 2021 and has exceeded the screening level in the monitoring events since. MW262 has historically

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

detected PFAS, but the latest April 2023 results represent an order of magnitude increase. The risk assessment previously identified that off-Base groundwater was not used for drinking purposes and as this incomplete exposure pathway has not changed, the risk profile remains the same.

- PFAS concentrations in surface water bodies were generally consistent with historical results. Where increasing concentrations were observed on-base and off-base, these locations will continue to be seasonally monitored to identify trends.
- Sediment concentrations have remained stable and consistent with historical results with some slight increases (within the same order of magnitude as previous results), demonstrating seasonal effects of higher-than-average rainfall conditions increasing concentrations of PFAS downstream of known source locations, due to sediment deposition in run-off.

The pathways for PFAS exposure and risks to human health and ecological receptors presented in the HHRA (WSP, 2018a), ecological risk assessment (WSP, 2019c) and PMAP (Department of Defence, 2020) remain unchanged and therefore the risks profile remains unchanged.

Conclusions

The monitoring conducted over the period covered within this report is considered to have met the objectives of the SAQP (AECOM, 2023a) and the overall OMP as outlined in the PMAP (Department of Defence, 2020). Although some wells within Sub-Management Area One have been destroyed due to recent remediation works, the monitoring network is considered generally appropriate and sufficient for the program objectives.

The CSM was reviewed, and no changes were identified to the sources, pathways or receptors at the base and within the Monitoring and Management Areas.

It is recommended that the OMP for groundwater, surface water and sediment is continued to monitor the extent of PFAS, potential migration and any associated risk changes in accordance with the SAQP.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) outlined in the PFAS Management Area Plan (PMAP) (Department of Defence, 2020) at the Royal Australian Airforce (RAAF) Base Townsville (the 'base') located Townsville, Queensland.

The monitoring targeted PFAS in groundwater, surface water and sediment at selected locations on-base and in surrounding off-base areas, including the Management Area as outlined in the PMAP (Department of Defence, 2020) and as depicted in **Figure F1, Appendix A**. Locations which are monitored off-base are located within the Monitoring Area, depicted in **Figure F1, Appendix A** as a pink outline.

To meet the objectives of the OMP, the monitoring was undertaken in accordance with the *Sampling and Analysis Quality Plan* (SAQP) (AECOM, 2023a) (Rev 9 dated 5 April 2023). The SAQP was reviewed and updated, as required, prior to each monitoring event.

This Interpretative Report has been prepared in general accordance with the Defence *PFAS OMP Annual Interpretive Report Guidance* (Version 0.4) issued in October 2022 (Department of Defence, 2022). The report summarises the results of the monitoring completed in the monitoring period from December 2020 to May 2023 (hereafter referred to as "the monitoring period").

1.1 Purpose and objectives

The objective of the monitoring program set out in the OMP is to continue to assess changes in the nature and extent of PFAS within the environment, where Defence's historical use of legacy Aqueous Film Forming Foam (AFFF) has led to a potentially elevated risk to a receptor, or potential future risk to a receptor within the Management Area.

Assessing changes in the distribution, concentration, and transport (pathways) of the contaminants against appropriate guideline values provides:

- An evidence-based approach for targeted and effective risk management decision making to protect human health and environmental receptors.
- An early warning indication that additional management of PFAS contamination may be warranted in areas not currently understood to be affected by PFAS.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Department of Defence, 2020), the Human Health Risk Assessment (HHRA) (WSP, 2018a) or Ecological Risk Assessment (ERA) (WSP, 2019c) documentation, as required.

1.2 Scope

The scope of works for this Ongoing Monitoring Interpretive Report is to assess changes to the nature and extent of select PFAS over the monitoring period (December 2020 to May 2023) and evaluate if these changes have implications for the understanding of the Conceptual Site Model (CSM) and the risk profile with respect to PFAS impacts within the Management Area.

This included a review of the 2020 annual interpretive report (AECOM, 2021b) and an evaluation of data reported in the following factual reports (included in **Appendix E**), historical data, and meteorological data:

- *Rainfall Event Sampling Factual Report, December 2020* (AECOM, 2021c)
- *Rainfall Event Sampling Factual Report, February 2021* (AECOM, 2021d)
- *Sampling Event Factual Report, April 2021* (AECOM, 2021e)
- *Sampling Event Factual Report, October 2021* (AECOM, 2021f)
- *Rainfall Event Sampling Factual Report, January 2022* (AECOM, 2022a)

- *Sampling Event Factual Report, April 2022* (AECOM, 2022b)
- *Sampling Event Factual Report, October, and December 2022* (AECOM, 2022c)
- *Rainfall Event Sampling and Sampling Event Factual Report, April, and May 2023* (in draft) (AECOM, 2023b)
- *RAAF Base Townsville Detailed Site Investigation – PFAS* (WSP, 2018b)
- Data for river levels within the Monitoring Area and meteorological data (see **Section 6.0**).

To complete this scope of work, AECOM completed biannual groundwater, surface water and sediment monitoring in April and October 2021, April and October 2022 and April to May 2023, in accordance with the SAQP (AECOM, 2023a) applicable at the time of sampling. Rainfall event sampling was conducted in, December 2020, February 2021, January 2022 and April 2023.

2.0 Base setting

2.1 Base description

Table 1 summarises the base identification and setting for RAAF Base Townsville as presented in the PMAP (Department of Defence, 2020) with updated information, where relevant.

Table 1 Site Identification and Setting Summary

Element	Description
Base ID	RAAF Base Townsville, 0874
Location	The base is located in Garbutt, a suburb of Townsville, Queensland. Entry to the base is off Ingham Road, Garbutt, approximately five kilometres (km) from Townsville City, as shown in Figure F1 in Appendix A .
Regional climate (Refer to Section 6.3 for further information)	The regional climate of Townsville is classified as tropical; however, rainfall is typically lower than other locations on the coast of North Queensland. The wet season, from approximately October to April is associated with hot and humid conditions with periods of heavy rain. The dry season is associated with dry, warm days and cool nights from approximately May to September. The OMP sampling events have been designed to target the end of the wet and dry seasons.
Topography, geology, and hydrogeology	<p>The base and surrounds are generally flat and low lying and are associated with the Bohle River and Townsville Town Common Conservation Park wetlands systems, which are subject to flooding and tidal inundation. The base has an elevation of between 2 and 5 metres Australian Height Datum (mAHD). The elevation decreases towards to north and northwest, reaching sea level in the Townsville Town Common Conservation Park and at Pallarenda and Rowes Bay beaches.</p> <p>The general underlying geology is Quaternary-aged alluvium comprising clay, silt, sand, and gravel. The surface geology is presented in the Detailed Site Investigation (DSI) Report (WSP, 2018b).</p> <p>The geology is varied across the Monitoring Area; however, in general it is described as Pleistocene, quartzose, fluvial sands and gravels deposited by the Ross/Bohle River systems, overlain by shallow marine and estuarine clays, which in turn are overlain by coastal plain sediment comprising silts, clays, and minor sands. The underlying basement of Townsville is described as Julago Volcanic, comprising rhyolite to andesitic lava tuff, volcanic breccia, agglomerate with some conglomerate, sandstone, siltstone, shale, and coal seams.</p> <p>There are three rocky outcrops in the region: Many Peaks Range to the north, Mount Louisa to the southwest and Castle Hill to the east.</p> <p>Three aquifers have been identified at the base (WSP, 2018b), summarised as:</p> <ol style="list-style-type: none"> 1. A shallow unconfined sand aquifer hosted in the coastal sand dunes of Cleveland Bay, Rowes Bay and Pallarenda, with a maximum depth of 6.5 metres below ground level (mbgl); overlying 2. A shallow, semi-confined aquifer comprised of interbedded clays, silts and sands forming a connected aquifer across the base, with depths between 8 mbgl (on-base) and 11 mbgl (within Garbutt), overlying 3. A deeper, semi-confined aquifer located in sands and gravels associated with paleo-channels at depths between 15 and 40 mbgl. <p>Inferred groundwater flow directions derived during the DSI (WSP, 2018b) and the Seasonal Monitoring Reports (WSP, 2019a; WSP, 2019b) indicated groundwater flows in a north to northeast direction across the Monitoring Area towards the Townsville Town Common Conservation Park and Rowes Bay. A piezometric high point extends from Garbutt across the southeast corner of the base to north area of the base, potentially due to a higher rate of surface water infiltration in this area. Groundwater</p>

Element	Description
	<p>flow is partially radial around this area towards the west, northwest, northeast and east.</p>
Surface Water and drainage	<p>The base has three main surface water catchments: the Bohle River drainage sub-basin including Bohle River/Louisa Creek/Town Common catchment, Three Mile Creek and Mundy Creek (also referred to as Captain's Creek). The monitoring network targets these catchments, both on-base and off-base.</p> <p>The three main drainage channels which flow into the base are Louisa Creek, Peewee Creek and Mount St John Drain, all of which have catchments within the urbanised suburbs to the south and east. Peewee Creek is a small watercourse that flows into Louisa Creek. Louisa Creek drains to the Townsville Town Common Conservation Park to the north of the base. Drainage to the west enters the base through the Mount St John Drain, which is separated from Louisa Creek by an elevated ridge line. The primary flow path of the drain is north, away from the base.</p> <p>On-base, a network of drains primarily direct surface water towards the northwest towards the Louisa Creek floodplain, Townsville Town Common Conservation Park and the Bohle Estuary. Surface water from the southeast corner of the base is directed to the east and then north into Mundy Creek catchment and ultimately Rowes Bay. The ordnance loading aprons and Runway 01/19, drain towards the northern boundary into the palustrine wetlands located adjacent to Rowes Bay Golf Club and ultimately into Three Mile Creek. The area to the north of Runway 01/19 along the eastern boundary of the base, drains east into the watercourse that runs along the northern side the Belgian Gardens Cemetery, joining Mundy Creek to the east before flowing north into Rowes Bay.</p> <p>Sections of the base located adjacent to the runways, are subject to inundation and have pumping networks designed to prevent flooding. Surface water is pumped from sumps which discharge to the wetlands along the western, northwestern and northern sides of the base.</p> <p>Waterways and catchments are labelled in Figure F1 in Appendix A.</p>
Vegetation	<p>Grounds on base are regularly maintained by the Estate Maintenance and Operation Support (EMOS) contractor. This includes mowing of grassed areas.</p> <p>Areas of wetland vegetation are present across the western portion of the Base. These areas are populated with protected marine plants and classed as "Nationally Important Wetlands" by the <i>Environmental Protection and Biodiversity Conservation (EPBC) Act 1999</i>. However, the environmental values cited in the EPBC Protected Matters Search Tool report (Commonwealth of Australia, 2021) are unlikely to be sustained given the historical use of the Property and the enactment of the wildlife hazard management plan which manages habitat on and surround the Base to limit the frequency and severity of bird strikes with aircraft (AECOM, 2019).</p>
Current and previous land use (including AFFF use)	<p>The base has operated as an airfield since the late 1930s and the two runways are now shared with the Townsville Civilian Airport. The base is subject to a large range of operational uses including but not limited to four military units, accommodation facilities, a fire station, current and former fire training grounds, fuel farms and an aircraft runway. PFAS was a component of legacy AFFF used at the base for managing fuel fires and training Defence personnel in fire-fighting techniques, which contained containing perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA) as active ingredients.</p> <p>Defence has phased out the use of legacy AFFF to the use of Ansulite foam which does not contain PFOS and PFOA as active ingredients, although they are still present in trace amounts. Ansulite is used by Defence only in emergency situations where human life is at risk, or in controlled environments to test equipment.</p> <p>Previous environmental investigations have identified that soil, sediment, surface water and groundwater on- and off-base have been impacted by PFAS.</p>

Element	Description
Land uses surrounding the base	The surrounding area comprises the residential suburbs of Pallarenda, Rowes Bay, West End and Belgian Gardens. Other land use includes various public facilities and parklands, a cemetery, and commercial/light industrial land use in the suburbs of Mount Louisa, Mount St John and Bohle. The Townsville Town Common Conservation Park is zoned as "Public Utilities – Townsville City Council (Reserves)" and "Special Uses – National parks" under the Townsville City Plan. Bohle River and Bohle River estuary are also extensively used for recreational fishing.

2.2 Management Area

The PFAS Management Area comprises the limits of the base where management actions, including those where institutional controls have been adopted, are identified, and managed by the PMAP (Department of Defence, 2020). The PMAP identifies three discrete Sub-Management Areas within the Management Area, which are monitored for changes in PFAS concentrations in groundwater, surface water and sediment. The Management Area and three Sub-Management Areas are shown on **Figure F1, Appendix A** and the Sub-Management Areas are presented in **Section 2.2.1** below. Off-base monitoring locations located outside the Management Area are within the Monitoring Area outlined in pink on **Figure F1, Appendix A** and discussed further in **Section 2.2.2**.

2.2.1 Sub-management areas (Source Areas)

The Sub-Management Areas have been defined based on the source areas identified in the DSI (WSP, 2018b). The Sub-Management Areas are outlined in **Table 2** and shown on **Figure F1, Appendix A**.

Table 2 Sub-management areas on-base

Sub-management area	Monitoring locations	Purpose
Sub-Management Area One: Former Fire Training Area (CSR_QLD_000246).	MW013, MW116 ¹ , MW118, MW126 ¹ , MW129 ¹ (Monitoring locations depicted in Figure F2, Appendix A)	This area is located in the southeastern portion of the base. Surface water from this area flows to Mundy Creek. Historically the area was used for routine fire training activities, purging of fire trucks, and testing of aqueous AFFF mixing (Department of Defence, 2020).
Sub-Management Area Two: Former Fire Training Area (CSR_QLD_000244), Fire Station (CSR_QLD_000245), Fuel Farm 2 (CSR_QLD_000351).	MW005, MW015, MW016, MW021, MW046, MW054, MW055, MW081, MW090, MW109, MW110, MW138, MW139, MW246, MW250, MW251 (Monitoring locations depicted in Figure F2, Appendix A)	This area is located in the centre of the base and is a source area for Louisa Creek Catchment and the Townsville Town Common. This area has been defined to manage the PFAS source from historical fire training activities, equipment testing, sparging of fire trucks and AFFF spills at the fire station (Department of Defence, 2020).
Sub-Management Area Three: 5 Aviation Regiment (5AVN)	MW009, MW038, MW043, MW114, MW125, MW142, MW247, MW248, MW249 ¹ (Monitoring locations depicted in Figure F2, Appendix A)	This area is located in the southwestern portion of the base and is a source area for Louisa Creek Catchment and the Townsville Town Common. This management area is defined to manage the PFAS source from testing AFFF deluge systems in the 5AVN precinct, including discharges and spills from hangars (Department of Defence, 2020).

¹ Historical monitoring location.

2.2.2 Remaining on-base groundwater monitoring areas

Table 3 presents remaining on-base groundwater monitoring wells located within the Management Area.

Table 3 Remaining on-base groundwater monitoring locations

Area	Monitoring locations	Purpose
Remaining on-base		
Northern section of base	MW136, MW140, MW243, MW244	These locations are downgradient of Sub-Management Area Two and allow for monitoring of transport of contaminants from this Sub-Management Area.
Northwest of runway 07/25	MW112	This location is downgradient of Sub-Management Area Three and allows for monitoring of transport of contaminants from this Sub-Management Area.
East and southeast of Sub-Management area one	MW026, MW033, MW034, MW061, MW063, MW120, MW222, MW223, MW224, MW232	These locations are cross-gradient to downgradient of Sub-Management Area One and allow for monitoring of transport of contaminants from this Sub-Management Area.
South of Ingham Road	MW226, MW227, MW228, MW229	These locations are close to the base and allow for monitoring of boundary concentrations.
Balance of base area	MW002, MW004, MW056, MW057, MW122, MW135, MW230 (replaced with MW300), MW234, MW235, MW241, MW242, MW245, MW255, MW265, MW470	These locations are generally spread around the boundary of the base and allow for monitoring of concentrations entering or leaving the base.

2.3 Monitoring Area

In addition to the on-base locations, groundwater monitoring locations and surface water catchments off-base are also monitored for changes in condition within the Monitoring Area, outlined in pink on **Figure F1, Appendix A**. These areas are presented in the following sub-sections.

2.3.1 Additional groundwater monitoring areas

The groundwater monitoring areas outside the Management Area (on-base) are presented in **Table 4**.

Table 4 Off-base groundwater monitoring locations

Area	Monitoring locations	Purpose
Off-base		
Townsville Town Common Conservation Park	MW201, MW202, MW203, MW204, MW205, MW206, MW207, MW208	These locations are located in the nearby sensitive receiving environment.
Bohle River and Bohle Industrial Estate	MW231, MW237, MW238, MW239, MW240, MW254, MW262	Monitoring of these locations allows for an understanding of groundwater flow and potential cross-gradient flow of contaminants or capture of off-base sources of contamination.

Area	Monitoring locations	Purpose
Pallarenda	MW233, MW252, MW253	These locations are in the residential suburb of Pallarenda, to the north and down-gradient of the base.
Rowes Bay and Belgian Gardens	MW209 (replaced with MW301), MW210 (replaced with alternative location MW471), MW211, MW212, MW213, MW214, MW215, MW216, MW256, MW261, MW264, MW467	These locations are in the residential suburbs of Rowes Bay and Belgian Gardens, to the northeast of the base.
Garbutt	MW217, MW218, MW219, MW220, MW221, MW225, MW236, MW257, MW258, MW259, MW260, MW263, MW266, MW267, MW268, MW269, MW270	These locations are in the residential suburb of Garbutt, to the southeast of the base.

2.3.2 Surface water catchments

To aid in understanding transport of contaminants off base, surface water catchments have been defined based on the drainage channels identified in the DSI (WSP, 2018b). The surface water and sediment monitoring areas have been outlined in **Table 5**. These areas were selected to target the different catchments local to the base.

Table 5 Surface water catchments

Catchment	Monitoring locations	Purpose
Mundy Creek (Monitoring locations depicted in Figure F3, Appendix A)	SW/SD001, SW/SD010, SW/SD106, SW/SD108, SW/SD109, SW/SD113, SW/SD114, SW/SD115, SW/SD116, SW/SD117, SW/SD118, SW/SD119, SW/SD121, SW/SD132, SW/SD208, SW/SD209.	This catchment is monitored to understand the transport of PFAS in surface water from Sub-Management Area One as defined in Table 2 .
Bohle River / Louisa Creek / Town Common (Monitoring locations depicted in Figure F3, Appendix A)	SW/SD013, SW/SD014, SW/SD016, SW/SD017, SW/SD019, SW/SD021, SW/SD110, SW/SD111, SW/SD112, SW/SD120, SW/SD123, SW/SD125, SW/SD126, SW/SD127, SW/SD129, SW/SD131, SW/SD201, SW/SD202, SW/SD203, SW/SD204, SW/SD205, SW/SD206, SW/SD207.	This catchment is monitored to understand the transport of PFAS in surface water from Sub-Management Area Two and Sub-Management Area Three as defined in Table 2 .
Three Mile Creek (Monitoring locations depicted in Figure F3, Appendix A)	SW/SD102, SW/SD107, SW/SD210.	This catchment is monitored to understand the transport of PFAS in surface water from a potential former fire training ground (CSR_QLD_000247) at the northern end of the main runway.

A subset of surface water locations are sampled as part of the rainfall event sampling, these are shown in **Figure F3, Appendix A**.

3.0 Sampling and Analytical Methodology

3.1 Sampling Methodology

The SAQP (Rev 9, April 2022, (AECOM, 2023a)); **Appendix D**) outlines the proposed schedule, methodology, analytical regime and rationale for sampling, prescribing six-monthly groundwater, surface water and sediment sampling on and off-base, with the addition of one rainfall event per calendar year. A rainfall event is triggered in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au (BOM, 2023) website or 100 mm of cumulative rainfall over a 7-day period and includes surface water sampling at 19 locations, daily for a period of 5 days.

The list of groundwater monitoring wells, surface water and sediment locations sampled during each of the above events and the rationale for the well and location selection is summarised in the SAQP (AECOM, 2023a). Deviations from the SAQP are presented below in **Section 3.2**.

A summary of the monitoring events completed between December 2020 and May 2023, is provided in **Table 6**.

Table 6 Summary of Monitoring (December 2020 to May 2023)

Monitoring Event (Sampling dates)	Scope as per SAQP applicable at sampling time	Samples Collected	Analysis
Rainfall Event, December 2020 after 50 mm of rainfall recorded at Townsville Aero (BOM station 032040) on 27 December 2020. (AECOM, 2021c) (27 - 31 December 2020)	19 SW samples collected on five consecutive days	18 SW samples collected on five consecutive days. 1 sample collected on four days due to accessibility.	PFAS extended suite, inorganics, metals
Rainfall Event, February 2021 after 61 mm of rainfall recorded at Townsville Aero (BOM station 032040) on 9 February 2021. (AECOM, 2021d) (9 – 13 February 2021)	19 SW samples collected on five consecutive days	18 SW samples collected on five consecutive days. 1 sample collected on four days due to accessibility.	PFAS extended suite, inorganics, metals
Biannual Sampling – April 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2021e) (15 April - 28 May 2021)	Gauging at 25 selected wells 110 GW samples 42 SW samples 42 SD samples	109 GW samples 39 SW samples 37 SD samples	PFAS extended suite
Biannual Sampling – October 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2021f) (28 September – 16 October 2021)	Gauging at 27 selected wells 85 GW samples 42 SW samples 42 SD samples	84 GW samples 35 SW samples 41 SD samples	PFAS extended suite
Rainfall Event, January 2022 after 85 mm of rainfall recorded at Townsville Aero (BOM station 032040) on 26 January 2022. (AECOM, 2022a) (26 -30 January 2022)	19 SW samples collected on five consecutive days	18 SW samples collected on five consecutive days. 1 sample collected on four days due to accessibility.	PFAS extended suite
Biannual Sampling – April 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022b) (11 April - 5 May 2022)	Gauging at 26 selected wells 110 GW samples 42 SW samples 42 SD samples	109 GW samples 42 SW samples 42 SD samples	PFAS extended suite

Monitoring Event (Sampling dates)	Scope as per SAQP applicable at sampling time	Samples Collected	Analysis
Biannual Sampling – October and December 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022c) (5 October - 19 October 2022 and 12-13 December 2022)	Gauging at 26 selected wells 85 GW samples 42 SW samples 42 SD samples	81 GW samples 33 SW samples 41 SD samples	PFAS extended suite
Biannual Sampling – April and May 2023 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2023b) (11 April - 4 May 2023)	Gauging at 28 selected wells 107 GW samples 42 SW samples 42 SD samples	105 GW samples 40 SW samples 40 SD samples	PFAS extended suite

Notes: SW = surface water; GW = groundwater, SD = sediment

3.2 Deviations from SAQP requirements

The works undertaken over the monitoring period generally complied with the SAQP (AECOM, 2023a) which notes deviations from the OMP. Some deviation from the SAQP (AECOM, 2023a) was recorded as some locations were not able to be sampled due to access restrictions, damage to the monitoring well network, or dry surface water channels at the time of sampling. These deviations are summarised in the following subsections.

3.2.1 Groundwater

The deviations from the SAQP for groundwater samples are detailed in **Table 7**.

Table 7 Deviations from SAQP for groundwater

Sampling event	Location ID	Issue	Impact
April 2021	All 27 groundwater gauging locations	The depth to groundwater is to be measured commencing with on-base wells and moving to off-base locations and finishing with tidally influenced wells along the coastline and waterways. The depth to groundwater was measured at both on base and off base wells concurrently. Off-base tidally influenced wells along the coastline and waterways were gauged prior to other off-base wells.	Nil. Tidally influenced wells were gauged within the same tide, therefore this is not considered to impact interpretation of data.
	MW237 and MW239	Depth to groundwater was not recorded at MW237 and MW239 during the gauging round as these locations were inadvertently missed on the SAQP figure and so data from these locations were not included in inferred groundwater contours. SAQP figures were updated prior to the October 2021 sampling round.	Minor

Sampling event	Location ID	Issue	Impact
	MW244	Location was not sampled as it was unable to be located beneath pooled surface water and sediment related to construction works.	Minor. Alternative down gradient wells were able to be sampled.
October 2021	All 27 groundwater gauging locations	The depth to groundwater is to be measured commencing with on-base wells and moving to off-base locations and finishing with tidally influenced wells along the coastline and waterways. The depth to groundwater was measured at both on base and off base wells concurrently by two field staff. Off-base wells along the coastline and waterways were gauged prior to other off-base wells.	Nil. Tidally influenced wells were gauged within the same tide, therefore this is not considered to impact interpretation of data
	MW267	Depth to groundwater was not recorded at MW267 during this gauging round as this location was not accessible due to construction works at the time of sampling. Therefore, MW260 was gauged in place of MW267.	Nil. Alternative well location gauged to assist with groundwater contour development.
		MW267 was not sampled as access was prohibited due to construction works.	Minor. Alternative wells available close to this location were able to be sampled thereby reducing the potential impact of not sampling at this location.
April 2022	MW253	Well was unable to be accessed this round due to damage to monument.	Minor. Sampling during this monitoring round could not be completed. Repairs to the monument were requested and completed. Sampling from this location was able to be completed during the October 2022 event.
October 2022 and December 2022	MW004, MW255, MW207	Water quality parameters were not reported due to a data migration error with AECOM's electronic data collection software.	Nil. Water quality parameters are not used for interpretation of PFAS trends. Readings of water quality parameters at these locations were able to be completed during the April and May 2023 event
	MW246, MW471	Insufficient water column was present for collection of water quality parameters.	
	MW116, MW126, MW129	Monitoring locations were decommissioned as part of works being completed by contractors within Sub-management area one and could therefore not be gauged or sampled.	Minor. Two monitoring wells (MW013 and MW118) remain within Sub-Management Area One, therefore coverage of the area can be maintained via these and other surrounding locations (MW033, MW034, MW120).

Sampling event	Location ID	Issue	Impact
	MW301	Location was dry and could not be sampled	Minor. Monitoring location was sampled during the previous and following rounds. Coverage of the area was maintained through two other local wells (MW208, MW471).
	MW218	Resampled in December 2022 due to new historic maximum reported during October 2022 sampling event	Resampling confirmed the new maximum concentration for PFAS.
April and May 2023	MW013	MW013 was unable to be sampled due to construction works being completed in Sub-management Area 1 restricting access to this location.	Minimal impact. Adjacent location MW120 was substituted as an alternative to MW013 for the gauging round and for the generation of groundwater contours. MW118 remains within the northern portion of Sub-management Area 1 and was able to be accessed and sampled to obtain a representative groundwater sample down-gradient of Sub-management Area 1. Locations immediately south and east of Sub-management Area 1 (MW033, MW034, MW063 and MW120) were accessed and sampled providing up- and cross-gradient information. Monitoring network is considered to provide adequate coverage of Sub-management Area 1.
	MW258	MW258 was unable to be sampled due to a damaged gatic cover bolt preventing access to the well.	Minimal impact. MW225, MW257 and MW259 are in the vicinity of MW258, and were accessed and sampled providing adequate coverage of the area.
	Multiple Locations	One of the water quality meters (WQM) used did not have a turbidity probe so this parameter was not recorded for 35 groundwater locations. Data syncing errors resulted in the loss of data for seven groundwater and two surface water locations.	Minimal impact. Water quality data is not used for assessment against guidelines.
	N/A	Trip blank required to be submitted to laboratory with each batch. Trip blanks were included with three batches throughout the program (EB2311298, ET2302407 and 986709). This did not meet the expected frequency of one per batch of samples submitted to the laboratory.	Refer to Section 4.0 .

3.2.2 Surface water

The deviations from the SAQP for surface water samples are detailed in **Table 8**.

Table 8 Deviations from SAQP for surface water

Sampling event	Location ID	Issue	Impact of deviation on data set
December 2020 (Rainfall Event)	SW016	Location SW016 was unable to be sampled on one of five days (31 December 2020) due to safety concerns associated with flooded access roads. This location was not sampled on this date.	Minor impact – Concentrations of PFAS compounds at SW016 were highest on the first day of sampling. Concentrations decreased over the first three days of sampling. All samples collected at this location were above the 95% species protection guideline for freshwater and marine ecosystems. This is consistent with all but two on-base surface water sampling locations. The collection of a surface water sample at this location on the fifth day would be unlikely to affect the interpretation of the data.
February 2021 (Rainfall Event)	SW016	Location SW016 was unable to be sampled on one of five days (11 February 2021) due to conflict with base activities. Access was not granted by air traffic control on this date and the location was not sampled.	Concentrations of PFAS compounds at SW016 were highest on the second day of sampling. All samples collected at this location were above the 95% species protection guideline for freshwater and marine ecosystems. This is consistent with all but two on-base surface water sampling locations. It is considered that the collection of a surface water sample at this location on 11 February 2021, on the third day of the sampling program, would be unlikely to affect the interpretation of the data.
April 2021	SW106, SW201 and SW209	SW106, SW201, SW209 were inaccessible during the sampling round due to flooding and unsafe access, therefore surface water samples could not be collected from these locations. Attempts were made on two occasions to access these locations; however, safe access was unable to be provided during the April 2021 monitoring event.	<p>SW106 and SW/209 are located on-base and off-base, respectively, in the Mundy Creek Catchment. Surface water flow directions, as defined in the PMAP (Department of Defence, 2020) indicate that SW209 is located downstream of SW106, and SW108 and SW208 are located downstream of SW209.</p> <p>Historically PFAS detections at SW106 and SW209, have fluctuated between the same orders of magnitude and several orders of magnitude higher than PFAS detections at downstream SW108 and SW208.</p> <p>The absence of data from SW106 and SW/209 may impact on interpretation of data within the Mundy Creek Catchment.</p> <p>SW201 is the upstream sampling location of the Bohle River. Historically PFAS detections at SW201 were the same order of magnitude as samples collected downstream at SW129, and therefore the absence of data from SW201 in this sampling round is unlikely to impact on interpretation of data.</p>

Sampling event	Location ID	Issue	Impact of deviation on data set
October 2021	SW013, SW019, SW106, SW107, SW121, SW125 and SW209	SW013, SW019, SW106, SW107, SW121, SW125 and SW209 were dry at the time of sampling and no surface water samples were collected during October 2021.	The lack of water provides information about the condition and seasonality of surface water in these areas and demonstrates that PFAS is not migrating in surface water during the dry season at these locations.
January 2022 (Rainfall Event)	SW016	Location SW016 was unable to be sampled on the second day of sampling (27 January 2022) due to flooding restricting safe access to the location.	From data collected, PFAS concentrations were highest on the first day of sampling, consistent with other locations, and as sampling was able to be completed on the subsequent days, the interpretation of PFAS migration, through the catchment, due to rain events was not affected.
April 2022	Bohle River Catchment	Sampling by boat completed in the first week of May instead of April due to favourable tidal conditions and sub-contractor availability.	Minimal impact is expected. Historically sampling during May has occurred for these locations (2019) with no impact to results noted.
October 2022	SW001, SW013, SW016, SW019, SW125, SW121, SW132, SW102, SW107	Locations were dry or with insufficient volume to collect a sample at the time of sampling and no surface water samples were collected during October 2022.	<p>The lack of water provides information about the condition and seasonality of surface water in these areas and demonstrates that PFAS is not migrating in surface water during the dry season at these locations.</p> <p>Three other surface water samples were able to be collected from near SW121 and SW132 (SW010, SW119, SW117).</p> <p>Sediment samples were able to be collected from the co-location to provide information on the presence of PFAS at these locations in dry season conditions.</p>
April and May 2023	Rainfall event sampling locations	Integration of rain event and wet season surface water sampling events.	No impact on data set.
	SW106 and SW209	SW106 and SW209 were inaccessible due to flooded road conditions.	Minimal impact as locations have been historically sampled and there is sufficient information from other locations to inform the interpretation of the distribution of PFAS within the Monitoring and Management Areas for April and May 2023.
	SW109 and SW119	Syncing errors of WQM resulted in the loss of data for surface water locations SW109 and SW119.	Water quality data is not used for assessment against guidelines and therefore there is minimal impact to the data set.

Sampling event	Location ID	Issue	Impact of deviation on data set
	N/A	Trip blank required to be submitted to Laboratory with each batch. Trip blanks were included with three batches throughout the program (EB2311298, ET2302407 and 986709). This did not meet the expected frequency of one per batch of samples submitted to the laboratory.	Refer to Section 4.0 .

3.2.3 Sediment

The deviations from the SAQP for sediment samples are detailed in **Table 9**.

Table 9 Deviations from the SAQP for sediment

Sampling event	Location ID	Issue	Impact
April 2021	SD106, SD201 and SD209	SD106, SD201, SD209 were inaccessible during the sampling round due to flooding and unsafe access, therefore sediment samples could not be collected from these locations. Attempts were made twice to access these locations; however, safe access was unable to be provided during the April 2021 monitoring event.	Minor impact – Refer discussion above in Table 8 for these co-located surface water samples.
	SD119, SD127	No sediment was available for collection at SD119 and SD127 at the time of sampling. No sediment sample was analysed from this location in April 2021.	Minor impact. Location was sampled in October 2021.
October 2021	SD132	No sediment was available for collection at SD132 at the time of sampling. No sediment sample was analysed from this location in October 2021.	Minor impact. Locations were sampled in October 2021.
October 2022	SD014, SD120, SD125	Resampled in December 2022 due to new historic maximums reported during October 2022 sampling event	Resampling confirmed the new maximum concentration for PFAS at SD120 and SD125, whilst resampling at SD014 found results more in line with historic maximums.
	SD126	No sediment available to sample at the location.	Location was sampled during the next monitoring round in April 2023.
April and May 2023	SD109 and SD119	SD106 and SD209 were inaccessible due to flooded road conditions.	Minimal impact – locations have been historically sampled and will be resampled in the dry season of 2024.

3.3 Changes to the Monitoring Network

Minor monitoring well repairs were completed during the monitoring period to allow consistent access for sampling. Further details are provided in the individual factual reports in **Appendix E**. The monitoring well network is considered sufficient for the purpose of monitoring and repairs are considered to have had insignificant impact on the dataset.

4.0 Quality Assurance and Quality Control

Data validation completed as part of the December 2020 (AECOM, 2021c), February 2021 (AECOM, 2021d), April 2021 (AECOM, 2021e), October 2021 (AECOM, 2021f), January 2022 (AECOM, 2022a), April 2022 (AECOM, 2022b), October/December 2022 (AECOM, 2022c) and April/May 2023 (AECOM, 2023b) Sampling Event Factual Reports is discussed in the individual reports (included as **Appendix E**).

During the April and May 2023 sampling event, trip blank samples were not submitted to the laboratory at a rate of one per batch of primary samples due to an oversight by field staff. Trip blanks were included with three batches throughout the program (EB2311298, ET2302407 and 986709). Concentrations were reported below the laboratory limit for all analytes tested in the trip blanks, except for 0874_QC552_230505, which had detections of PFHxA, PFHxS, PFOS, and PFOA. Sample 0874_QC552_230505 was submitted to the secondary laboratory along with the triplicate samples in batch 986709. As trip blank 0874_QC552_230505 was prepared by a different laboratory, the source of the detections was unable to be verified. None of the triplicate or trip blank samples were used for interpretation of the nature and extent of PFAS at RAAF Base Townsville and therefore this trip blank result does not affect the decision-making process for the project. The triplicate samples were generally within the same order of magnitude as the primary samples and therefore the interpretation of the data is not affected.

Data validation procedures employed in the assessment of the field and laboratory quality assurance and quality control (QA/QC) data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of the factual and interpretive reports.

5.0 Screening criteria

Adopted screening criteria references national guidance in the form of the *PFAS National Environmental Management Plan* (NEMP; HEPA, 2020), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. At the time of preparing this report, a number of guidance documents were in circulation in Australia including:

- Heads of Environmental Protection Agencies, 2020. *PFAS National Environmental Management Plan* (NEMP) 2.0 (HEPA, 2020).
- Department of Health, 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017 (updated September 2019) (Department of Health, 2019).
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019 (National Health and Medical Research Council (NHRMC), 2019).
- *National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013* (National Environment Protection Council (NEPC), 1999).

The adopted PFAS screening criteria to assess the data generated as part of the monitoring are presented in **Table 10** below. The adopted PFAS screening criteria presented, is based on the Human Health Risk Assessment (HHRA; WSP, 2018a) and Ecological Risk Assessment (ERA; WSP, 2019c), and is also in accordance with the PMAP (Department of Defence, 2020) and the SAQP (AECOM, 2023a).

Table 10 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment/reference
Human health receptors			
Recreational use – surface water	PFOS+PFHxS ¹	2 µg/L	The values are from HEPA (2020).
	PFOA	10 µg/L	<i>All surface water results were compared to these criteria.</i>
Drinking water	PFOS+PFHxS ¹	0.07 µg/L	The values are from HEPA (2020).
	PFOA	0.56 µg/L	<i>All off base groundwater results were compared to these criteria.</i>
Ecological receptors			
Freshwater and marine (95% species protection values)	PFOS	0.13 µg/L	The values are from HEPA (2020).
	PFOA	220 µg/L	<i>All surface water and groundwater results were compared to these criteria.</i>

Note:

At the time this report was prepared, no HEPA (2020) endorsed criteria were available for PFAS in sediments.

¹Where the guideline values refer to the sum of PFOS and Perfluorohexane sulfonate (PFHxS), this includes PFOS only, PFHxS only, and the sum of the two (HEPA, 2020).

6.0 Contextual and ancillary information

6.1 Remediation projects

PFAS remediation projects were commenced within Sub-Management Area One in the second half of 2022 and concluding in late-2023. Remediation works are planned to commence in Sub-Management Area Two in 2024. These remediation projects have the potential to change the PFAS concentrations in the source areas and to influence the surface water infiltration and runoff in the local area. The effect of the remediation activities on PFAS concentrations migrating from these areas will be assessed based on the outcomes of the ongoing monitoring results.

6.2 Infrastructure projects on base

The following infrastructure projects were completed in the monitoring period:

- North Queensland Mid Term Refresh (2022 ongoing)
- EST06271 – Commercial Centre Building 53 (November 2022 to December 2023)
- JP9101 PROJECT Phoenix (April 2023 to December 2023)
- EST08426 CEPS Generator Replacement (ongoing)
- AIR555 Development (2023)
- Land 4503 Army Aviation Program of Works (Townsville) (2023 to 2025).

Infrastructure works were identified at the Defence Fuel Installation, in the western portion of Sub-Management Area Two, during the sampling events in 2021. General construction activities were noted as being underway at the base during the January 2022 rainfall sampling event. No extensive earthworks were identified as part of these projects, and this is considered unlikely to impact concentrations or mobility of PFAS in the noted areas. No other infrastructure activities were identified during the monitoring period.

6.3 Extreme weather events

Climatic data for the region is recorded at Townsville Aero (Station 032040), located on-base within Sub-Management Area Two (BOM, 2023). The monitoring period was characterised by wet summers and dry winters. Monthly rainfall for the monitoring period and for the historic dataset dating back to 1941 is presented in **Plate 1** below.

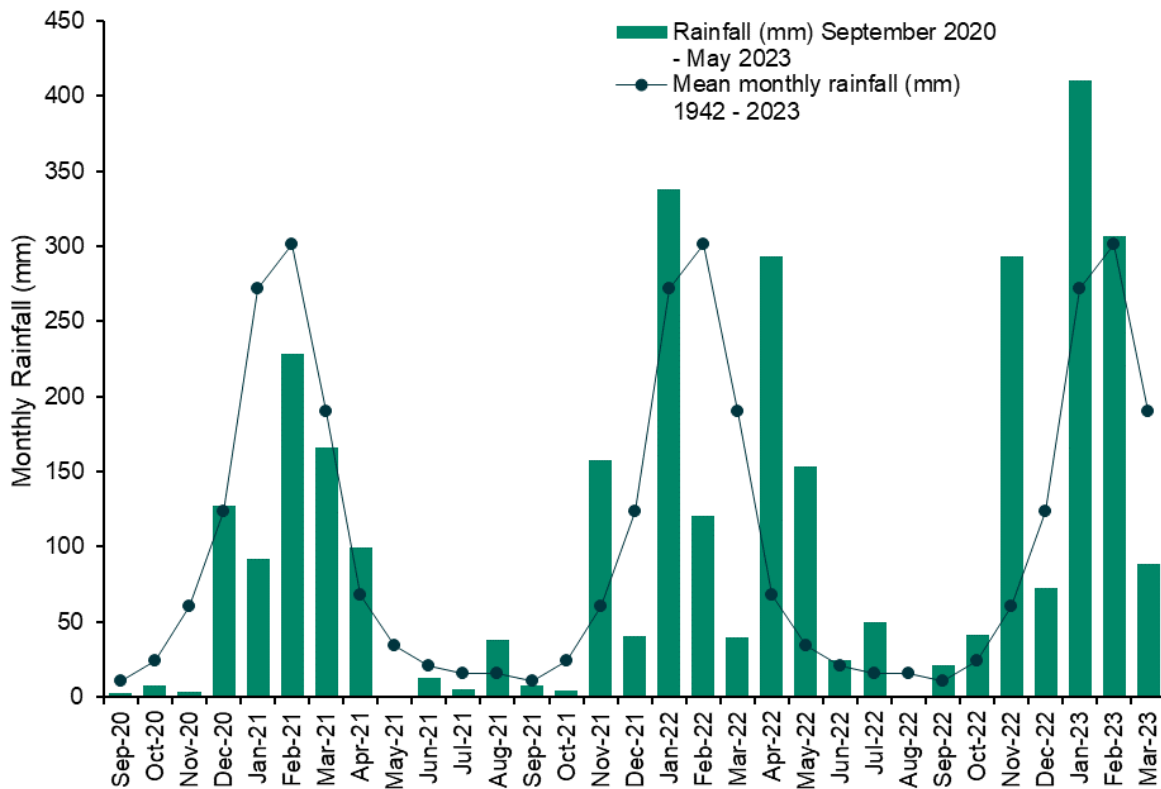

Plate 1 Monthly rainfall data –Monitoring period vs. mean (Station 032040 up to 31/05/2023) (BOM, 2023)

The mean annual rainfall from 1940 to 2023 is 1,140 mm. In the years 2020, 2021 and 2022 the annual rainfall was 788 mm, 759 and 1,448 mm respectively. In 2023, from January to May, the cumulative monthly rainfall was 925 mm which is above average for the same months in 2020 and 2021.

For the sampling events conducted in December 2020 through to October 2021 the rainfall was generally below the long term mean monthly rainfall. From November 2021 to May 2023 rainfall was generally above average. Further details about rainfall triggered events and rainfall experienced during and preceding the sampling events within the monitoring period are detailed below:

- December 2020
 - The December 2020 rainfall sampling event was triggered by 50 mm recorded rainfall on 27 December 2020 which was preceded by 29 mm recorded in the three days prior. A wet weather day (days with greater than 15 mm of rainfall) was experienced during sampling on 28 December 2020.
- February 2021
 - The February 2021 rainfall sampling event was triggered by 61.2 mm of rainfall recorded on 9 February 2021. Rain continued throughout the sampling event, from 9 February to 13 February 2021 with up to 21 mm recorded during sampling on 10 February 2021.
- April 2021
 - The recorded rainfall during April 2021 was 99.6 mm, which is above the annual mean for April (64.3 mm). During the April sampling event, 65.4 mm of rain was recorded with wet weather days on 21 April (with 18 mm), 23 April (with 15 mm) and 24 April (with 15 mm).

- October 2021
 - The recorded rainfall during October 2021 was 4 mm, which is lower than the annual mean of 10 mm. During the October sampling event 2 mm of rainfall was recorded. No wet weather days were experienced during this sampling event.
- January 2022
 - The January 2022 rainfall sampling event took place between 26 and 30 January 2022 and was triggered by 84.8 mm recorded rainfall on 26 January 2022. Rain continued throughout the sampling event, with 172 mm of rain recorded on day 2, 19 mm of rain on day 3, 14 mm of rain on day 4, and 1 mm of rain on day 5.
- April 2022
 - The recorded rainfall during April 2022 was 293.4 mm, which is above the monthly mean for April (67.7 mm). Three wet weather days (days with greater than 15 mm of rainfall) were experienced during the April 2022 sampling event (22 April, 25 April and 26 April 2022).
- October 2022
 - The recorded rainfall during October 2022 was 41.6 mm, which is also above the monthly mean (23.9 mm). No wet weather days were experienced during the October 2022 event, or the December 2022 resampling event (BOM, 2023).
- April and May 2023
 - The 2023 rainfall sampling event took place between 17 and 22 April 2023 and was triggered by 65.4 mm recorded rainfall on 17 April 2023. Rain continued throughout the sampling event, with 6.0 mm of rain recorded on day 2 and 0.2 mm of rain on day 4. The recorded rainfall during April 2023 was 65.4 mm, which is slightly below the monthly mean for April (67.7 mm). No wet weather days were experienced for groundwater sampling undertaken in April and May 2023.

Stream water level monitoring data for Louisa Creek (Station 532032) (Townsville City Council, 2023) for each rainfall event was as follows:

- The average river height during the December 2020 rainfall event sampling was 3.86 m AHD, reaching a maximum of 4.93 m AHD on the third day of sampling (29 December 2020).
- The maximum river height during the February 2021 rainfall event sampling was 5.03 m AHD on the first day of sampling (9 February 2021), with an average of 3.5 m AHD across the sampling event.
- During the January 2022 rainfall sampling event the average stream water level was 4.32 m AHD and reached a maximum of 5.78 m AHD on 27 January 2022 on the second day of sampling.
- The April 2023 rainfall sampling had an average stream water level of 3.51 m AHD and reached a maximum of 3.68 m AHD on 18 April 2023 (the second day of sampling).

A review of the data for this station shows fluctuation in stream water level over a 24-hour period, with up to 0.05 m variation in water level. This gauge is not located in a tidally influenced area. These fluctuations are due to commercial industrial and urban runoff in response to rainfall. This is discussed further in **Section 8.4.1**.

7.0 Monitoring data summary

The sampling events of the monitoring period are detailed in **Section 3.1**. The results are summarised in the following sections and shown on **Figures F4 to F23b** in Appendix A. The results are provided in **Tables T1 to T7** in **Appendix B**. In reviewing the data set for December 2020 to May 2023, AECOM also considered the historical data collected in 2017 as part of the PFAS DSI (WSP, 2018b), in 2018 and 2019 for the seasonal monitoring reports (WSP, 2019a; WSP 2019b) and in September 2019 to 2020 for the OMP (AECOM, 2021b). Seasonal trends and related data are further interpreted in **Section 8.0**.

The statistical method of Mann-Kendall has not been used to identify PFAS trends in groundwater given the site is located in a tropical area which has a climate of wet and dry seasons. There is insufficient data (at least eight monitoring event results) to allow statistical analysis of corresponding seasons (e.g. post wet season to post wet season).

7.1 Groundwater

7.1.1 Groundwater elevation and flow direction

The standing water level (SWL) was measured in a subset of wells representative of conditions across the base to evaluate the groundwater elevations (to m AHD) and flow regime. This gauging activity was completed within a 24-hr period. All wells were gauged prior to sampling. Groundwater elevation ranges within the subset of wells for events of the monitoring period are summarised in **Table 11** below. Full records of the gauging data across the monitoring period are available in each of the respective factual reports included as **Appendix E**.

Table 11 Summary of subset groundwater elevations for the monitoring period

Gauging event	No. wells	Min. SWL (m btoc)	Max. SWL (m btoc)	Min. GWE (mAHD)	Max. GWE (mAHD)
April 2021	25	0.450 (MW002)	2.881 (MW253)	0.731 (MW215)	4.216 (MW223)
October 2021	27	1.082 (MW003)	3.245 (MW239)	0.661 (MW135)	3.917 (MW223)
April 2022	26	0.646 (MW002)	2.918 (MW239)	0.734 (MW215)	4.036 (MW223)
October 2022	26	0.566 (MW002)	3.226 (MW225)	0.626 (MW206)	4.047 (MW232)
April 2023 ¹	28	0.508 (MW135)	2.646 (MW214)	1.017 (MW214)	4.457 (MW232)

Note: SWL = Standing Water level, GWE = Groundwater Elevation, m AHD = meters Australian Height datum, m bTOC = metres below top of casing. ¹ MW002 omitted from summary due to being flooded in April 2023.

Groundwater contours and inferred groundwater flow directions for April 2021, October 2021, April 2022, October 2022 and April 2023 are presented in **Figures F4 to F8 (Appendix A)**, respectively. Off-base groundwater wells to the north of the base were not included in the contours due to potential tidal influences distorting groundwater levels at these locations. The wells west of the base (in the Webb Drive industrial estate) were not included in the contours due to their distance from the base.

Figure F4 shows the inferred local groundwater flow direction during the end of wet season in April 2021 is to the north in the central and western portions of the base and east-northeast in the eastern portion of the base and adjacent suburb of Belgian Gardens.

Figure F5 shows the inferred local groundwater flow direction in the central portion of the base is to the northwest during the 2021 end of dry season event. In the east and northeast portion of the base, the inferred groundwater flow is northeast, in the direction of Rowes Bay, during the dry season. Off-base groundwater wells to the north of the base were not included in the contours due to potential tidal influences distorting groundwater levels at these locations.

Figure F6 shows the inferred local groundwater flow direction during the 2022 end of wet season event is to the north-northwest in the central and western portions of the base and northeast in the eastern portion of the base and adjacent suburb of Belgian Gardens.

Figure F7 shows the inferred local groundwater flow direction in the central portion of the base is to the northwest during the dry season. In the east and northeast portion of the base, the inferred groundwater flow is northeast, in the direction of Rowes Bay, during the dry season of 2022.

Figure F8 shows the inferred local groundwater flow direction during the 2023 end of wet season event is to the north/northwest in the central and western portions of the base and northeast in the eastern portion of the base and adjacent suburb of Belgian Gardens.

Overall groundwater flow direction does not appear to differ significantly between seasons with the overall flow regime radial towards the northwest, north and northeast. This is generally consistent with previous investigations (**Table T1, Appendix B**).

7.1.2 Geochemical Parameters

Groundwater geochemical parameters were measured in the field from the same retrieved HydraSleeve™ immediately following the collection of groundwater samples. The geochemical parameters are summarised in **Table 12** below. Current and historical field parameters are presented in **Table T1, Appendix B**.

Table 12 Summary – Groundwater Geochemical Parameters

Sampling Event	Dissolved Oxygen (DO) (mg/L)	Electrical Conductivity (EC) ($\mu\text{S}/\text{cm}$) ¹	pH (pH units)	Corrected Oxidative Reductive Potential (ORP) (mV) ²	Temperature (°C)
April/May 2021 (Wet Season)					
Minimum	0.14 (MW203)	221.2 (MW269)	3.39 (MW206)	1.5 (MW139)	17.6 (MW300)
Maximum	24.40 (MW268)	84,984.0 (MW255)	8.19 (MW257)	567.1 (MW206)	31.6 (MW016 and MW301)
October 2021 (Dry Season)					
Minimum	0.08 (MW253)	418.0 (MW470)	3.41 (MW206)	13.5 (MW208)	26.4 (MW206)
Maximum	4.10 (MW217)	108,128.0 (MW255)	8.43 (MW054)	500.2 (MW206)	33.6 (MW212)
April 2022 (Wet Season)					
Minimum	0.86 (MW140)	10.4 (MW301)	3.47 (MW206)	13.0 (MW211)	26.3 (MW470)
Maximum	7.45 (MW301)	133,650.0 (MW203)	8.18 (MW090)	432.6 (MW206)	33.4 (MW216)

Sampling Event	Dissolved Oxygen (DO) (mg/L)	Electrical Conductivity (EC) ($\mu\text{S}/\text{cm}$) ¹	pH (pH units)	Corrected Oxidative Reductive Potential (ORP) (mV) ²	Temperature (°C)
October 2022 (Dry Season)					
Minimum	0.19 (MW227)	233.2 (MW233)	3.28 (MW206)	-5.8 (MW467)	24.4 (MW056)
Maximum	7.40 (MW208)	82,555.0 (MW225)	8.96 (MW054)	450.0 (MW206)	31.2 (MW090)
April/May 2023 (Wet Season)					
Minimum	0.58 (MW267)	11.8 (MW233)	4.06 (MW207)	20.1 (MW267)	23.3 (MW239)
Maximum	6.91 (MW470)	138,829.0 (MW203)	8.14 (MW033)	449.9 (MW015)	34.2 (MW016)

Note: 1 – Microsiemens per centimetre; 2 – Oxidation-reduction potential measured in millivolts (mV) and corrected values calculated by the addition of an offset voltage of 194 mV (for reference electrode Ag/AgCl).

The stabilised readings from the monitoring period indicate:

- Poorly to well oxygenated conditions.
- Fresh to saline conditions.
- Acidic to slightly alkaline conditions. The median result was 6.82 and the average result was 6.80, indicating generally neutral conditions.
- Mildly to strongly reducing conditions.

The readings during the reporting period are consistent with previous investigations (WSP, 2019a; WSP, 2019b; AECOM, 2021b). Water quality parameters for temperature, DO and pH were generally consistent between sampling events while EC and ORP were variable.

A summary of the physical characteristics of the groundwater is presented in table below.

Table 13 Summary of groundwater physical properties observations

Sampling event	Observation	Locations
Biannual Sampling – April 2021	Sulfurous odour	MW002, MW004, MW005, MW013, MW015, MW016, MW021, MW034, MW038, MW043, MW046, MW054, MW055, MW056, MW061, MW109, MW110, MW116, MW120, MW122, MW125, MW126, MW135, MW136, MW138, MW139, MW201, MW203, MW205, MW208, MW219, MW221, MW231, MW247, MW248, MW255, MW266, MW267, MW268, MW467
	Putrefied odour	MW211, MW264 and MW300
	Metallic (iron) odour	MW206
	No other visible or olfactory indications of contamination were observed during the sampling of the monitoring wells.	
Biannual Sampling – October 2021	Sulfurous odour	MW002, MW013, MW043, MW010, MW116, MW118, MW125, MW135, MW139, MW205, MW213, MW244, MW300, MW467

Sampling event	Observation	Locations
	Groundwater colour was recorded as clear, black/grey, brown, pale yellow, red and orange. No other visible or olfactory indications of contamination were observed during the sampling of the monitoring wells.	
Biannual Sampling – April 2022	Sulfurous odour	MW013, MW138, MW203, MW226, MW244 and MW268
	Organic odours	MW118, MW129, MW140, MW206, MW221, MW267 and MW301
	Groundwater colour was typically recorded as light brown/yellow, to clear/low turbidity. No visible or olfactory indications of contamination were observed during the sampling of the other monitoring wells.	
Biannual Sampling – October and December 2022	Organic odours	MW118, MW056, MW135, MW244, MW264, MW267 MW016, MW055, MW002, MW033, MW226, MW227, MW234, MW265, MW213, MW225 and MW467
	Groundwater colour was typically recorded as light brown, low to medium turbidity. No visible or olfactory indications of contamination were observed during the sampling of the other monitoring wells.	
Biannual Sampling – April and May 2023	Sulfurous odour	MW004, MW043, MW057, MW061, MW112, MW118, MW125, MW203, MW232, MW244
	Organic odour	MW002, MW204, MW205, MW206, MW208, MW213, MW221, MW222, MW226, MW266, MW267, MW268
	Biosheen	MW002
	Groundwater colour was typically recorded as light grey to light brown, with low to medium turbidity. No visible or olfactory indications of contamination were observed during the sampling of the other monitoring wells sampled.	

7.1.3 Groundwater analytical results

All groundwater analytical results for this interpretative report included in the monitoring period are summarised in **Table T2 (Appendix B)**. Monitoring locations are presented in **Figure F2 (Appendix A)** and PFOS+PFHxS and PFOA concentration maps are presented in **Figures F10a to Figure F13b** for the events of the monitoring period.

Groundwater monitoring locations have been summarised by Sub-Management Area and PFOS, PFOA and PFOS+PFHxS concentrations recorded during the monitoring period. Sampling Events are summarised in **Table 14**.

Table 15 presents details of the first-time detections of PFOA, PFOS and PFOS+PFHxS, new exceedance of guidelines, and new historical maximum and minimum concentrations detected during the monitoring period.

Table 14 Summary of PFOS, PFOA and PFOS+PFHxS concentrations in groundwater

Sampling event	No. sample locations analysed	Compound	Concentration range (µg/L) in reporting period	No. of sample locations with concentrations > limit of reporting (LOR)	No. of sample locations exceeding human health drinking water guideline (HEPA, 2020)	No. of sample locations exceeding freshwater and marine 95% species protection guideline (HEPA, 2020)
Sub-management area one						
April 2021	5	PFOS	0.56 (MW118) – 186 (MW013)	5	N/A ¹	5
		PFOA	0.03 (MW118) – 25.9 (MW126)	5		0
		PFOS+PFHxS	0.95 (MW118) – 291 (MW126)	5		N/A ²
October 2021	5	PFOS	1.62 (MW118) – 248 (MW013)	5	N/A ¹	5
		PFOA	0.14 (MW118) – 45.3 (MW126)	5		0
		PFOS+PFHxS	2.71 (MW118) – 474 (MW126)	5		N/A ²
April 2022	5	PFOS	0.38 (MW118) – 305 (MW013)	5	N/A ¹	5
		PFOA	0.02 (MW118) – 19.6 (MW013)	5		0
		PFOS+PFHxS	0.73 (MW118) – 388 (MW013)	5		N/A ²
October 2022	2	PFOS	0.97 (MW118) – 59.9 (MW013)	2	N/A ¹	2
		PFOA	0.05 (MW118) – 18.4 (MW013)	2		0
		PFOS+PFHxS	1.67 (MW118) – 144 (MW013)	2		N/A ²
April – May 2023	1	PFOS	0.4 (MW118)	1	N/A ¹	1
		PFOA	<0.05 (MW118)	0		0
		PFOS+PFHxS	0.62 (MW118)	1		NA ²
Sub-management area two						
April 2021	16	PFOS	0.29 (MW090) – 10,700 (MW021)	16	N/A ¹	16
		PFOA	<0.01 (MW090) – 803 (MW021)	15		2
		PFOS+PFHxS	0.48 (MW090) – 26,100 (MW021)	16		N/A ²

Sampling event	No. sample locations analysed	Compound	Concentration range (µg/L) in reporting period	No. of sample locations with concentrations > limit of reporting (LOR)	No. of sample locations exceeding human health drinking water guideline (HEPA, 2020)	No. of sample locations exceeding freshwater and marine 95% species protection guideline (HEPA, 2020)
October 2021	16	PFOS	0.12 (MW251) – 12,200 (MW021)	16	N/A ¹	15

¹ There is no human health guideline for the current on-base groundwater scenarios given that groundwater is not currently used as a source of drinking water.

² There is no ecological guideline for PFOS+PFHxS in groundwater for the current scenarios.

Table 15 Summary of first-time detections, new exceedance of guidelines, and new historical minimums and maximums for PFOA, PFOS and PFOS+PFHxS in Groundwater

Sampling Event	Compound	First-time Detection	New exceedance of ecological guideline value for 95% freshwater / marine water species protection (HEPA, 2020)	New exceedance of human health guideline value for drinking water at off base locations (HEPA, 2020)	New historical minimum	New historical maximum ¹

	PFOS+PFHxS		N/A	None	MW221 (0.59 µg/L) MW267 (0.16 µg/L)	MW212 (0.06 µg/L) MW215 (0.14 µg/L) MW262 (2.07 µg/L)

¹ New historical maximum does not include first-time detections or new exceedance of guidelines.

Monitoring wells MW300 and MW301 were installed in October 2020 and were sampled for the first-time in April 2021 and therefore the detections of PFOA, PFOS and PFOS+PFHxS are reported as first-time detections. MW300 and MW301 were installed to replace the damaged monitoring wells MW230 and MW209 respectively, where detections of PFOA, PFOS and PFOS+PFHxS were historically recorded as presented in **Table T2, Appendix B**.

The new exceedance of the 95% species protection ecological guideline for freshwater and marine ecosystems in MW301 in April 2021 is consistent with previous results from MW209, which exceeded the guideline in April 2018.

Concentrations of PFOS were detected in MW206, MW218 and MW301 historically. The October 2021 sampling event reported a new exceedance of the 95% species protection ecological guideline for freshwater and marine ecosystems at these locations.

Off-base location MW215 exceeded the human health screening criteria (drinking water) in April 2022. Subsequent monitoring in October 2022 indicated that concentrations had reduced below the nominated screening criteria however concentrations exceeding the human health screening criteria were detected again in April 2023. MW215 is located in the Mundy Creek Catchment.

Off-base location MW262 exceeded the Freshwater and Interim Marine 95% screening criteria for PFOS and the human health screening criteria (drinking water) for sum of PFOS and PFHxS in groundwater in April 2023. MW262 is located in the Webb Drive industrial estate. MW215 and MW262 are not used for drinking water.

Historical groundwater concentrations of PFOA and PFOS+PFHxS have been displayed graphically on temporal trend graphs, by Sub-Management Area, in **Appendix C** for the following locations:

Table 16 Groundwater temporal trend graphs

Graph ID	Monitoring/Management Area	Monitoring wells
1a, 1b, and 1c	Sub-Management Area One	MW013, MW116, MW118, MW126, MW129.
2a, 2b, and 2c	Sub-Management Area Two	MW005, MW015, MW016, MW021, MW046, MW054, MW055, MW081, MW090, MW109, MW110, MW138, MW139, MW246, MW250, MW251.
3a, 3b, and 3c	Sub-Management Area Three	MW009, MW038, MW043, MW114, MW125, MW142, MW247, MW248, MW249.
4a, 4b, and 4c	On-base – Northern section and Northwest of Runway 07/25	MW136, MW140, MW243, MW244
5a, 5b, and 5c	On-base – East and Southeast of Sub-Management Area One	MW026, MW033, MW034, MW061, MW063, MW120, MW222, MW223, MW224, MW232
6a, 6b, and 6c	On-base – South of Ingham Rd	MW226, MW227, MW228, MW229

7.2 Surface water

7.2.1 Geochemical Parameters

Surface water geochemical parameters were measured prior to collecting samples. Current and historical field observations and field parameters are presented in **Table T3, Appendix B** and summarised in **Table 17** for the monitoring period.

The readings during the reporting period are considered consistent with previous investigations (WSP, 2019a; WSP, 2019b; AECOM, 2021b) with the parameters showing some variability between sampling events influenced by seasonal conditions.

Table 17 Summary – Surface Water Geochemical Parameters

Parameter	DO (mg/L)	EC ($\mu\text{S/cm}$)	pH (pH units)	Corrected ORP (mV) ¹	Temperature (°C)
December 2020 (Rain Event)					
Minimum	1.84 (SW010)	34.3 (SW123)	3.61 (SW125)	143.6 (SW131)	25.6 (SW127)
Maximum	12.9 (SW131)	22,376.0 (SW108)	9.39 (SW108)	551.8 (SW125)	36.3 (SW125)
February/April/May 2021 (Wet Season and Rain Event)					
Minimum	0.6 (SW131)	88.0 (SW121)	6.47 (SW131)	68.6 (SW131)	24.0 (SW127)
Maximum	13.9 (SW132)	49,888.0 (SW109)	10.35 (SW118)	393.3 (SW117)	35.4 (SW132)
September/October 2021 (Dry Season)					
Minimum	1.4 (SW117)	466.3 (SW010)	6.49 (SW110)	9.3 (SW021)	24.7 (SW014)
Maximum	14.6 (SW010)	178,290.0 (SW108)	9.51 (SW010)	380.4 (SW118)	35.1 (SW115)
January/April/May 2022 (Wet Season)					
Minimum	1.6 (SW013)	47.9 (SW010)	6.31 (SW131)	91.0 (SW131)	23.1 (SW013)
Maximum	13.2 (SW119)	100,174.0 (SW108)	10.12 (SW119)	404.1 (SW112)	35.7 (SW108)
October 2022 (Dry Season)					
Minimum	0.85 (SW117)	625.0 (SW123)	6.64 (SW106)	219.9 (SW010)	23.0 (SW127)
Maximum	13.2 (SW120)	56,549.0 (SW208)	9.38 (SW119)	392.3 (SW123)	36.0 (SW106)
April/May 2023 (Wet Season)					
Minimum	1.3 (SW016)	1.0 (SW131)	5.86 (SW016)	47.2 (SW016)	24.7 (SW127)
Maximum	14.5 (SW132)	50,466.0 (SW204)	9.38 (SW125)	404.3 (SW127)	36.0 (SW125)

¹ – Oxidation-reduction potential measured in millivolts (mV) and corrected values calculated by the addition of an offset voltage of 194 mV (for reference electrode Ag/AgCl).

The readings from the monitoring period indicate:

- Slightly to well oxygenated conditions
- Fresh to saline conditions
- Slightly acidic to slightly alkaline conditions
- Moderately reducing to moderately oxidising conditions.

The observations of physical properties of sampled surface water are summarised in Table 18.

Table 18 Summary of surface water physical properties observations

Sampling event	Observation	Locations
Rainfall Event, December 2020	Hydrocarbon sheen	SW017
	Biosheen	SW014, SW108, SW115, SW117, SW121, SW123 and SW131
	Organic odour	SW010, SW116, SW118
	Sulfurous organic odour.	SW131
Rainfall Event, February 2021	Hydrocarbon sheen	SW017
	Biosheen	SW014, SW102, SW116, SW117, SW121, SW125, SW129 and SW131
	Organic odour	SW014, SW102, SW108, SW112, SW115, SW125 and SW127
	Sulfurous odour.	SW102, SW010, SW117 and SW131
Biannual Sampling – April 2021	Biosheen	SW014, SW016, SW102, SW107, SW110, SW111, and SW113
	Organic odour	SW016, SW110, SW123
	Sulfurous, putrefied, or brackish odour.	SW112, SW010, SW113, SW117, SW118, SW210
Biannual Sampling – October 2021	Sulfurous odour	SW014 and SW021
	Biosheen	SW102, SW114 and SW116
	Organic odour	SW111
Rainfall Event, January 2022	Hydrocarbon sheen (and odour on 26 and 27 January 2022)	SW017
	Slight biosheen	SW121, SW109
	Very strong sulfurous odour	SW131
Biannual Sampling – April 2022	Organic odour	SW110, SW114 and SW202 to SW207
	Sulfurous odour	SW117 and SW131
	Biosheen	SW131
	High algal load / presence of organic material	SW111 and SW119

Sampling event	Observation	Locations
Biannual Sampling – October and December 2022	Weak organic odours.	SW131, SW021, SW114 and SW117
	Biosheen	SW208
	High algal load / presence of organic material	SW013, SW131, SW102 and SW120.
Biannual Sampling – April and May 2023	Slight organic odour	SW113
	Sulfurous odour	SW107
	Organic odour (rainfall event sampling)	SW010, SW016, SW116, SW118, SW121, SW125 and SW131
	Biosheen (rainfall event sampling)	SW016, SW102, SW121, SW127
	Foam (rainfall event sampling)	SW127

7.2.2 Surface Water Analytical Results

Historic surface water analytical results are presented in **Table T4 (Appendix B)**. Monitoring locations are presented in **Figure F3 (Appendix A)** and PFOS+PFHxS and PFOA concentration maps are presented in **Figure F14a to Figure F18b (Appendix A)**.

Surface water monitoring locations have been summarised by catchment and PFOS, PFOA and PFOS+PFHxS concentrations recorded during the monitoring period, with results presented in **Table 19** below.

Table 19 Summary of PFOA, PFOS and PFOS+PFHxS concentrations in surface water

Sampling event	No. samples analysed	Compound	Concentration range (µg/L)	No. of sample locations with concentrations > LOR	No. of sample locations exceeding human health recreational water guideline (HEPA, 2020)	No. of sample locations exceeding 95% species protection ecological guideline (HEPA, 2020)

¹ There is no ecological guideline for PFOS+PFHxS in groundwater for the current scenarios.

There were no first-time detections in surface water during the monitoring period. During the monitoring period there were new exceedances of adopted freshwater and marine 95% species protection guideline at two locations in April – May 2022 and one location in April 2023. There were also four locations with new exceedances of adopted human health recreational use guideline in April 2023. This has been presented in **Table 20** which summarises new historical minimum and maximum concentrations observed in surface water during the reporting period.

Table 20 Summary of new historical minimums and maximums for PFOS, PFOA and PFOS+PFHxS in Surface Water

Sampling Event	Compound	New exceedance of ecological guideline value for 95% freshwater / marine water species protection (HEPA, 2020)	New exceedance of human health guideline for recreational use (NHMRC, 2019)	New historical minimum	New historical maximum ¹

In addition to PFAS, selected surface water samples collected during the December 2020 and February 2021 rainfall event sampling were analysed for the following geochemical parameters:

- Major ions (sodium, calcium, magnesium and potassium) and anions (chlorine, sulphate, bicarbonate, carbonate)
- Total suspended solids
- Dissolved organic carbon.

These results are presented **Table T5, Appendix B**. Results for major ions for the rainfall events in December 2020 and February 2021 indicate that the cation composition is generally dominated by sodium and anion composition is dominated by chloride and to a lesser degree, sulfate, in all catchments.

7.3 Sediment

7.3.1 Sediment analytical results

Available sediment analytical results are presented in **Table T6 (Appendix B)**. Monitoring locations are presented in **Figure F3 (Appendix A)** and PFOS+PFHxS and PFOA concentration maps are presented in **Figure F19a to Figure F23b (Appendix A)**.

PFOS, PFOA and PFOS+PFHxS concentrations recorded during the monitoring period are summarised in **Table 22** below.

Table 22 Summary of PFOS, PFOA and PFHxS+PFOS Concentrations in Sediment

8.0 Discussion/interpretive analysis

8.1 Hydrogeology

The SWLs were measured in the groundwater monitoring wells to evaluate the groundwater elevations (to m AHD). Depth to groundwater measurements and the inferred potentiometric contours for the Management Area are presented in the factual reports in **Appendix E** and summarised in **Section 7.1.1**.

During the monitoring period, there were three sampling events which targeted the end of the wet season (April 2021, 2022 and 2023) and two sampling events that targeted the end of the dry season (October 2021 and 2022). In 2021, there was an average decrease of 0.69 m in groundwater elevation between the April and October monitoring rounds in the shallow monitoring wells, screened in the Quaternary alluvium aquifer. In 2022, there was an average decrease of 0.21 m in groundwater elevation between the April 2022 and October 2022 monitoring events in the shallow monitoring wells. Between the October 2022 and April 2023 sample events there was an average increase of 0.57 m in groundwater elevation, which demonstrates the response to rainfall during the wet season when the water level rises due to infiltration of rainwater recharging the aquifer.

The one deep monitoring well (MW140) showed a decrease of 0.74 m in October compared to elevations in April 2021, although there was only a decrease of 0.08 m in October 2022 compared to elevations in April 2022. Similarly, this well showed an increase of 0.69 m in groundwater elevation between the October 2022 and April 2023 event. The characteristics of the aquifer in the screened interval of MW140 are unknown. This well was installed prior to the DSI (WSP, 2018b) and no bore logs are available.

Below average rainfall was recorded for most months in 2021, with above average rainfall recorded in April and August 2021. A decrease in groundwater elevation in line with decreased rainfall is evident in the shallow monitoring wells for the 2021 events. As discussed in **Section 6.3** the rainfall during the events of 2022 to 2023 (AECOM, 2021b) was generally above the historic average (BOM, 2023). The increased average rainfall may have resulted in the reduced groundwater table fluctuation observed during 2022 and 2023 when compared to 2021 data.

Inferred groundwater flow directions in the shallow aquifer for sample events during the monitoring period were consistent with the flow presented in previous investigations (WSP, 2018b), with groundwater from the central and western portions of the base flowing north and northwest and groundwater from the northeast portion of the base flowing northeast to Rows Bay.

8.2 Groundwater Results

Groundwater results for PFOA and PFOS+PFHxS compared to assessment criteria are presented in **Table T2** in **Appendix B** and shown in **Figures F9a to F13b, Appendix A**.

The highest PFAS concentrations in the monitoring period were detected adjacent to the fire station, a previously identified source area, consistent with findings from the previous monitoring (AECOM, 2021b). The maximum concentrations of PFOS+PFHxS in the monitoring period were as follows:

- Sub-Management Area One: 388 µg/L at MW013 in April 2022 and 474 µg/L at MW126 in October 2021 which were higher than April 2021 wet season results. It is noted that MW116, MW129, and MW126 in this area were decommissioned prior to the dry season sampling round in October 2022 due to the remediation activities undertaken in this area.
- Sub-Management Area Two: 34,100 µg/L at MW021 in October 2021, which were higher than April 2021 wet season results.
- Sub-Management Area Three: 1,640 µg/L at MW248 in April 2022.

PFOS, PFOA or PFHxS concentrations were detected in monitoring wells down-hydraulic gradient from the identified PFAS source areas listed above and suggest that the groundwater impacts are associated with these areas.

The plume extents are consistent with that which was presented for the previous monitoring period (AECOM, 2021b).

8.2.1 Sub-Management Area One

Historical concentrations of PFOA and PFOS+PFHxS in Sub-Management Area One are presented in **Table T2 (Appendix B)** and graphically in **Graph 1a and 1b (Appendix C)**.

Both PFOA and PFOS+PFHxS concentrations in Sub-Management Area One are within historical ranges, with the exception of MW126. PFAS concentrations at MW126 had progressively been decreasing since 2017, however concentrations of PFOA and PFOS+PFHxS increased across both monitoring events during 2021, recording a new historical maximum for PFOS+PFHxS (474 µg/L) in October 2021. This location is within a source area which is listed as a former fire training area. Concentrations of PFOS+PFHxS decreased to 19 µg/L in April 2022 before this well was decommissioned and no further samples have been collected at this location.

As mentioned in **Section 6.1**, remediation activities commenced within this Sub-Management Area in the second half of 2022 to address PFAS sources related to the former fire training area. These activities have led to the decommissioning of monitoring wells MW116, MW126, and MW129. MW013 was unable to be accessed for the April 2023 sampling round, however concentrations at this location appear to be decreasing since the commencement of monitoring in 2017. No direct correlation between rainfall and PFAS concentrations in the wells in Sub-Management Area One was observed. The loss of the wells in this area presents a data gap.

Based on the historical data (**Table T2, Appendix C**), the lateral extent of the PFAS plume in groundwater, does not appear to have changed compared to the lateral extent presented in the 2018 DSI, 2019 seasonal events and the 2020 OMP sampling events (WSP, 2018b; WSP, 2019a; WSP, 2019b; AECOM, 2020; AECOM, 2021g). Some decreasing concentrations were observed in down-gradient wells MW026, MW033 and MW118. Further monitoring following the completion of the remedial and validation works would be required to confirm the contamination status of this area moving forward.

8.2.2 Sub-Management Area Two

Historical concentrations of PFOA, PFOS and PFOS+PFHxS in Sub-Management Area Two are presented in **Table T2 (Appendix B)** and graphically in **Graphs 2a and 2b (Appendix C)**. Sub-Management Area Two has historically reported the highest concentrations across the base.

Concentrations of PFOA, PFOS and PFOS+PFHxS in Sub-Management Area Two are generally stable at all locations, with results within historic ranges except for MW005, MW109, MW021 and MW138 as outlined below:

- At MW005 (near the fuel farm) there was an increase in PFOS concentrations in April 2022 (817 µg/L, greater than the historical maximum 745 µg/L recorded in October 2021, the previous monitoring round but within the same order of magnitude), although concentrations decreased during the subsequent October 2022 (to 692 µg/L) and April 2023 (804 µg/L) monitoring round.
- At MW021, PFOA increased from 803 µg/L in April 2021 to 1,300 µg/L in October 2021. Increasing concentrations of PFOS+PFHxS from 26,100 µg/L in April 2021 to 34,100 µg/L in October 2021 were also noted at this location. This monitoring well is located within the fuel transport compound adjacent to the fire station, a previously identified source of PFAS. The reason for the sudden increase at this location is unknown and requires further monitoring as part of the ongoing monitoring program to evaluate localised migration pathways. The PFAS concentrations reported do not appear to correlate with the highest rainfall periods. Concentrations have indicated a fluctuating downward trend to the latest sampling event concentrations reported for April 2023 which reported PFOA at 286 µg/L and PFOS+PFHxS at 14,700 µg/L. Concentrations of PFOS+PFHxS also increased at upgradient well MW139 in April 2021, however, decreased to a historical low in October 2021. Concentrations in downgradient wells MW015 and MW016 have remained within the historical range.
- At MW109 there was an increase in PFOS concentrations in April 2023 (1,510 µg/L, greater than historic maximum 1,360 µg/L recorded in June 2017). The reason for the increase requires further

monitoring to identify potential trends and no additional contributions to the legacy PFAS source in this area were identified at the time of the sampling in April 2023.

- At MW138 in April 2023 there was an increase in PFOS, PFOA, and PFOS+PFHxS (1,080 µg/L, 61.4 µg/L, and 1,870 µg/L respectively) above the historic maximum concentrations of these analytes. MW138 is located centrally within Sub-Management Area Two (Former Fire Training Area). The groundwater elevation at this location between October 2021 and April 2023 changed by 0.461 m AHD whereas over the period from August 2017 to April 2021 a difference in groundwater elevation of 0.811 m AHD was reported. It is possible that the higher groundwater elevation has resulted in potential leaching of PFAS in soils in this source area. Further monitoring is required to assess if groundwater elevations may be contributing to the mobilisation of PFAS at this source area.

The new maximum results reported at MW138 and MW109 and fluctuating concentrations at other wells within Sub-Management Area Two indicate that further monitoring and investigation combined with remedial actions are required to address the PFAS sources in this area. It is also acknowledged that this Sub-Management Area is identified for remediation works during 2023.

There is some seasonality in concentrations of PFOA, PFOS and PFOS+PFHxS across Sub-Management Area Two, with concentrations seen to fluctuate in both increasing and decreasing directions during dry and wet season sampling events at several locations. Examples of increased concentrations at the end of dry season sampling is seen at MW054, MW109, MW110, MW246, and MW250. Examples of increased concentrations at the end of wet season sampling are seen at MW139 and MW251. There does not appear to be a consistent response across Sub-Management Area Two to changes in seasonal conditions.

Although concentrations of PFOS in MW005, MW109 and MW138 have increased, changes to the lateral extent of the PFAS plume have not been observed during the monitoring period compared to that presented in the 2018 DSI, 2019 seasonal events and 2020 and 2020 OMP sampling events (WSP, 2018b; WSP, 2019a; WSP, 2019b; AECOM, 2020; AECOM, 2021g).

8.2.3 Sub-Management Area Three

Historical concentrations of PFOA, PFOS, and PFOS+PFHxS in Sub-Management Area Three are presented in **Table T2 (Appendix B)** and graphically in **Graph 3a and 3b (Appendix C)**.

PFAS concentrations in groundwater in Sub-Management Area Three are generally stable at all locations, with the exception of MW248 which displayed trends consistent with the 2020 AIR (AECOM, 2021b), showing increases of PFOA and PFOS+PFHxS following wet season rainfall and a reduction in concentrations over the dry season. This seasonality could potentially indicate that residual PFAS are present within soils located above the groundwater table being mobilised through rainfall infiltration.

New historical maximums of PFOS, PFOS+PFHxS and PFOA were detected at MW009 during the monitoring period. Concentrations of PFAS at MW009 appear to be demonstrating an increasing concentration trend, however the results are still within the same order of magnitude as historical results. All monitoring results at MW009 including the current monitoring period exceed the adopted ecological guidelines, except October 2022.

New historical maximums of PFOS and PFOS+PFHxS were detected at MW125 in April 2021, an order of magnitude above historical results with concentrations reducing in October 2021 and further reducing in 2022. By April 2023, the wet season results had reduced by two orders of magnitude and were reported within the historical range of concentrations for this location. Some response to seasonality was observed with results tending to be higher in response to dry season conditions and lower concentrations in response to wet season conditions. This response to seasonality is not consistent in all wells across Sub-Management Area Three.

At MW142 new maximum concentrations of PFOS and PFOS+PFHxS were detected in October 2021 and again in October 2022 however the results were still within the same order of magnitude of the previous historical maximum for the location. By April 2023, the concentrations of PFAS at this location were again reported close to the detection limits. Of all groundwater monitoring locations within the Sub-Management area, the concentration range of MW142 is the lowest.

The inferred groundwater flow direction across the area is towards the north-west, and as such MW125 is upgradient of MW248 however MW009 and MW043 are located between these two wells. New historical maximum concentrations of PFOS were reported in MW009 while concentrations at MW043 were reported within the historical range.

Seasonal fluctuations in PFAS, PFOS and PFOS + PFHxS concentrations are not consistent across all wells within this Sub-Management Area however, where seasonality is observed, the same trends are present, at the same locations, each sampling round, which potentially indicates that residual PFAS are present within soils located above the groundwater table which are mobilised through rainfall infiltration.

The lateral extent of the PFAS plume does not appear to have changed during the monitoring period compared to that presented in the 2018 DSI, 2019 seasonal events, and 2020 OMP sampling events (WSP, 2018b; WSP, 2019a; WSP, 2019b; AECOM, 2020; AECOM, 2021g).

8.2.4 Other On-Base Wells

Concentrations of PFOS and PFOA at MW056 (near the northwestern base boundary) increased by an order of magnitude in October 2021 however concentrations decreased in the subsequent three rounds of monitoring, by an order of magnitude.

New historical maximum concentrations of PFOS and PFOA were reported one order of magnitude higher than the 2018 result at MW112 (in the central portion of the base between Sub-Management Area Two and Three) in April 2021, however the concentrations consistently decreased in all subsequent monitoring rounds. New historical maximum concentrations of PFOS and PFOA were reported at MW245 (north of MW112 and west of Sub-Management Area Two) within the same order of magnitude as previous results and concentrations have decreased since. A new historical maximum concentration of PFOS was also reported at MW241 (in the northeastern corner of the base) in April 2021 and concentrations at this location have continued to fluctuate within the same order of magnitude. New historical maximum concentrations of PFOS were reported at MW470 (in the northeastern corner of the base) in October 2021, however the result is within the same order of magnitude as previous concentrations and PFOS results have since decreased to within the historical range reported at this location. Nearby wells have similar concentrations and therefore the plume extent remains unchanged.

New historical maximum concentrations of PFOS were reported at MW061 and MW224 (in the southeast corner of the base), MW265 (near the Ordnance Loading Areas) in May 2023, however the result is within the same order of magnitude as previous concentrations.

A new historical maximum concentration of PFOS was reported at MW300 (southwestern base boundary) in May 2023 that was equal to the ecological criteria. Concentrations at this location have been steadily increasing since the well was installed in 2021 however the concentrations reported are still below those historically reported for MW230 which was replaced by MW300, therefore the plume extent remains unchanged.

Concentrations at MW255 (on the western base boundary) have continued to decrease since December 2018.

Based on the above discussion, the distribution of PFAS has not changed for the on-base wells.

8.2.5 Off-Base Wells

Concentrations of PFOS+PFHxS and PFOA are generally consistent with historical results. Minor increases in concentrations over the previous maximums are within the expected variability.

New historical maximum concentrations of PFOS were reported at MW205 in April 2021 and in MW206 in October 2021. Both wells are located in the Town Common, north of the base. Concentrations decreased to below the detection limit in April and October 2022 and were most recently detected again in April 2023. The results are an order of magnitude lower previous concentrations.

MW211 (located at the eastern extent of the Three Mile Creek Catchment, southeast of the former Rowes Bay landfill) was equal to the ecological guideline in April 2021 for 95% species protection in freshwater for PFOS and a new maximum concentration for PFOS was reported in October 2021.

MW213 (located at the northeastern extent of the Mundy Catchment) reported a new maximum concentration for PFOS+PFHxS and PFOS in April 2021. MW214 (located at the northeastern extent of

the Mundy Catchment, near MW213) reported a new maximum concentration for PFOS+PFHxS in April 2023. MW256 (located cross gradient to MW214 and MW215) exceeded the 95% species protection ecological guideline in freshwater for PFOS in April 2021. Concentrations at this location have since decreased below the nominated ecological guideline.

MW215 (located upgradient of MW213 and MW214) exceeded the human health drinking water guideline in April 2022 and a new maximum concentration for PFOS was reported in April 2023. A new maximum concentration was also reported at MW216 in April 2022. Concentrations in the northeastern portion of the Mundy Creek Catchment were generally within the same order of magnitude therefore the distribution of PFAS has not changed for the off-base wells in the Mundy Creek Catchment.

Increasing concentrations and new exceedances of the adopted ecological guideline for PFOS were reported from October 2021 onwards at MW218 (located centrally within the Mundy Creek Catchment, and hydraulically down gradient from Sub-Management Area One and Two). The PFOS+PFHxS concentrations in April 2021 was 0.42 µg/L and then increased an order of magnitude to 2.92 µg/L in October 2021. Concentrations have stabilised within the same order of magnitude in the current monitoring period with a new historical maximum concentration of PFOS+PFHxS of 10.6 µg/L reported in December 2022. MW221 located in the same area as MW218, has historically detected PFAS within the same order of magnitude as the new maximum concentrations at MW218 and both locations are within the historical identified extent of the PFAS plume. Observations were similar to an increase in concentrations in nearby surface water (SW117) and all down gradient concentrations in groundwater concentrations were generally within the same order of magnitude as historical ranges. The plume geometry also remains unchanged.

MW253 (located in Pallarenda, in the Three Mile Creek Catchment) reported a new exceedance of the human health drinking water guideline April 2021 and concentrations at this location have been fluctuating within the same order of magnitude, below the human health drinking water guideline since and the concentrations appear to have stabilised.

MW262 had new exceedances of the human health screening levels in April 2021 and ecological screening levels in April 2023. MW262 is located in the Webb Drive industrial precinct in the Nohle River/Louisa Creek Catchment. MW262 has historically detected PFAS, but the latest April 2023 results represent an order of magnitude increase. As PFAS have historically been detected at this location, the plume geometry is unchanged.

MW301 (near the Rowes Bay golf course and dog off-leash beach) reported new exceedances of the adopted ecological guideline during the October 2021 sampling event. Concentrations have stabilised within the same order of magnitude. MW301 is hydraulically downgradient of the former Rowes Bay landfill and northern extent of the base where increased concentrations have been reported within the monitoring period at MW470, MW467, MW471 and nearby on-base wells.

8.2.6 Summary

Overall, the groundwater monitoring results indicate the PFAS plume extent is consistent with the previous monitoring period (AECOM, 2021b).

Repairs to damaged wells and replacement of lost wells were carried out during the current monitoring period. Some well maintenance recommended following the April and May 2023 monitoring event remains outstanding heading into the next monitoring period.

8.3 Rainfall Event Surface Water Results

Rainfall event surface water sampling locations are presented in **Figure F3, Appendix A**.

Non-PFAS sampling was conducted during the rain event sampling of December 2020 and February 2021, and therefore is not representative of static surface water conditions across the Management Area. Comparison of the water chemistry results from the DSI (WSP, 2018b) to results from the rain event sampling shows differences in water chemistry due to freshwater inflow into the catchment and possible tidal influences within the Mundy Creek Catchment at SW116 on days 2 and 3 of the February 2021 rain event. Increases in chloride and magnesium concentrations at SW116 on days 2 and 3 of the February 2021 rain event were shown to be decreasing by day 5 of the rain event. SW129 within the Bohle River exhibited higher concentrations of chloride and sodium on days 1 and 2 of the December 2020 rain event decreasing by two orders of magnitude by day 5 of the rain event. The change in

concentrations over the course of the rain event demonstrates the influence of large amounts of rainfall on the hydrochemistry of surface waters within the Management Area.

Rainfall event sampling in April 2023 at location SW127 observed foam at the surface of the water body, however, concentrations of PFAS were close to the laboratory LOR. The observed foam may be a result of another environmental influence. Rainfall event sampling at SW010, SW121 and SW132 detected concentration spikes during the targeted five-day sampling events. Locations SW010, SW121 and SW132 detected new maximum concentrations of PFOA, PFOS, and PFOS+PFHxS during rainfall event sampling in the monitoring period, although within the same order of magnitude as historical results.

Rainfall sampling event concentrations have been observed to exceed bi-annual wet and dry season sample event concentrations. These spikes are expected, as the events are designed to target the first flush of contaminants following the dry season.

8.4 Regular Surface Water Results

Concentrations of PFOS+PFHxS in surface water generally decreased with increasing distance from the base, as shown in **Figure F14a** to **Figure F18b** in **Appendix A**.

Trends in surface water results collected during the scheduled biannual sampling events are discussed by catchment in **Sections 8.4.1** to **8.4.3** below.

8.4.1 Bohle River/Louisa Creek/Town Common Catchment

PFOA and PFOS+PFHxS concentrations in on-base locations within the Bohle River/Louisa Creek/Town Common catchment have continued a general stable trend, except for SW123 (in the northwestern corner of Sub-Management Area Three) which showed an increase in PFAS concentrations in October 2021, with PFOS+PFHxS increasing to a historical maximum of 48 µg/L (**Graph 13a** and **13b**, **Appendix C**). The historical maximum is within the same order of magnitude as historical results and concentrations have since decreased in the April 2023 monitoring round. Ongoing fluctuations of concentrations are observed at this location in response to rainfall with higher concentrations generally recorded towards the end of the rain event.

PFOA, PFOS and PFOS+PFHxS concentrations in on-base locations within the Bohle River/Louisa Creek/Town Common catchment have continued a generally stable trend, except locations SW016, SW125 and SW126. New maximum concentrations at SW126 in October 2021 and SW016 and SW125 in April 2023 are within the same order of magnitude as historic results. The higher concentrations in October 2021 for SW126 were not replicated in the October 2021 sediment results however a new historical maximum was reported at SD126 in April 2021 which may have affected the October 2021 surface water results. Surface water locations SW016 and SW125 have co-located sediment samples SD016 and SD125 respectively which detected new maximum concentrations in the monitoring period with April 2023 also being the most elevated results. Locations SW/SD016 and SW/SD125 receive surface water runoff from areas west of the main runway of the base which includes Sub-Management Area 2 and 3. The elevated surface water results are potentially associated with runoff from source areas during above average rainfall in 2022/2023 which may have increased concentrations in surface water runoff over the monitoring period from on-base PFAS source areas.

Off-base locations within the Bohle River/Louisa Creek/Town Common catchment are generally stable for PFOA (**Graph 14a**, **Appendix C**), however PFOS+PFHxS concentrations have been observed to be fluctuating (**Graph 14b**, **Appendix C**). New maximum concentrations of PFOS and PFOS+PFHxS were detected at locations to the northwest of the base within the Town Common Conservation Park (SW203, SW204, SW206 and SW207), and south of the base within the Louisa Creek Catchment (SW127 and SW021).

Off-base Town Common Conservation Park locations SW203, SW204, SW206 and SW207 are down gradient of the base and down gradient of on-base surface water sampling locations (SW126, SW131) which have historically recorded PFOS and PFOS+PFHxS concentrations an order of magnitude greater than those current observations off-base. At present, concentrations recorded at surface water locations have fluctuated above ecological criteria during post wet season sampling events and return below the ecological criteria during post dry season sampling events due to seasonality. Whilst this

pattern had existed at locations SW206 and SW207, in May 2022, a new exceedance of the ecological criteria was observed at SW203 and SW204 (the Bohle River mouth).

The concentrations particularly at SW203 and SW204 should continue to be monitored to ensure that future changes in off-base concentrations are captured. Consideration should also be given to whether additional down gradient sampling locations are required as SW204 represents the northwest extent of the monitoring area and the mixing zone between the Bohle River and the Coral Sea. It is possible that periods of high rainfall may result in migration of PFAS downstream. Mass flux studies currently being undertaken by Defence, will confirm the influence of rainfall on PFAS mass leaving the base via surface water.

Off-base Louisa Creek Catchment locations SW021 reported new historical maximum concentrations of PFOS and PFOS+PFHxS in the May 2023 event, an order of magnitude higher than historical results and representing a new exceedance of the adopted ecological guideline value for PFOS. Location SW127 is upstream of any potential PFAS influences from the base (WSP, 2018b) and increased concentrations may be from off-base sources in the upstream commercial/industrial area of Garbutt. Location SW021 is downstream from the Ingham Road sports field (Ruediger Park) which was identified in the DSI as a potential PFAS source (WSP, 2018b) in which high rainfall are potentially resulting in migration of PFAS downstream. Ruediger Park is an attached Property associated with RAAF Base Townsville.

Off-base locations SW021, SW203 and SW204 had new exceedances of the adopted ecological guideline value for PFOS, although other off-base surface water locations have exceeded this criteria.

8.4.2 Mundy Creek Catchment

New historical maximum sediment concentrations were also noted at SD132 co-located with surface water sample SW132. Location SW/SD132 is down-gradient of Sub Management Area 1 where PFAS remediation commenced in the second half of 2022 which also coincided with rainfall above historical average over the 2022/2023 wet season. Hence, the new historical concentrations at SW/SD132 are potentially associated with this remediation activity combined with above average rainfall.

Off-base concentrations of PFAS in surface water recorded some new maximum concentrations, however, overall the results were within historical ranges for the off-base dataset during the monitoring period with the exception of SW108 which detected PFOS in April 2023 an order of magnitude above historical ranges. These new maximum results coincide with new maximum concentrations also being detected in the sediment sample SD108 for the same sample event. Location SW/SD108 is down-gradient of potential source areas on-base. The higher surface water and sediment results are potentially associated with the above average rainfall resulting in increased concentrations in surface water runoff from potential PFAS source areas on-base and remediation activities within Sub-Management Area One.

Off-base surface water locations SW108, SW109 and SW116 reported new exceedances of adopted guidelines for human health recreational use for PFOS+PFHxS concentrations. However other off-base surface water locations have historically exceeded this adopted this guideline. Recreational exposure to surface water (such as swimming) is expected to be limited given the occurrence of crocodiles in the area and seasonal stingers in the estuaries. The known extent of PFAS in surface water has not changed.

8.4.3 Three Mile Creek catchment

New maximum concentrations were detected in April 2023 at SW210 and in May 2023 at SW107 in the off-base Three Mile Creek Catchment surface water locations. Off-base surface water location SW107 reported a new exceedance of adopted guidelines for human health recreational use for PFOS+PFHxS concentrations in May 2023, however other off-base surface water locations have historically exceeded this adopted guideline. Recreational exposure to surface water is expected to be limited given the occurrence of crocodiles in the area and seasonal stingers in the estuaries.

The results for SW107 are an order of magnitude higher than historical results however for SW210, they are within the same order of magnitude. Sampling at SW107 has been limited to collection of samples in the post-wet season monitoring events due to the location being dry during October sampling events.

Sampling of SW102 has tended to occur during wet season monitoring rounds only due to lack of water in the dry season with only one surface water sample collected during October 2021. Co-located with surface water location SW107 is sediment sample SD107 which detected new historical maximum concentration also in the April 2023 wet season event. SW107 is downstream of the base boundary and SW102. Surface water flowing off-base to the north discharges to the ephemeral wetland area. Potentially the above historic average rainfall has increased concentrations in surface water runoff over the monitoring period from on-base potential PFAS source areas.

8.4.4 Summary

Consistent with the previous reporting period (AECOM, 2021b), PFOA, PFOS, and PFOS+PFHxS concentrations experienced some seasonal fluctuation evident in increased concentrations in the months following the wet season in which high rainfall above historic averages are potentially resulting in migration of PFAS to surface water.

Generally, concentrations of PFAS compounds are lower in off-base monitoring locations compared to on-base locations, with the highest concentrations reported close to the on-base source areas. Concentrations further from the base have been reported at lower concentrations when compared to sampling locations near the base boundary. PFAS was detected in surface water bodies approximately 6 km away from the base (SW204) at concentrations two orders of magnitude lower compared to source area locations on-base (SW125). This is consistent with the previous monitoring period and there is a possibility of unidentified off-base sources of PFAS (WSP, 2018b).

The current monitoring location network and frequency is considered adequate to evaluate PFAS impacts migrating in surface water off-base.

8.5 Sediment

Concentrations of PFOA and PFOS+PFHxS are shown in **Figure F19a** to **Figure F23b** in **Appendix A**.

8.5.1 Bohle River/Louisa Creek/Town Common catchment

Concentrations of PFOA, PFOS and PFOS+PFHxS in the Bohle River/Louisa Creek/Town Common catchment were highest on-base. Five on-base locations SD013, SD014, SD016, SD125 and SD131 located west of the Sub-Management Areas recorded new maximums during the monitoring period. The new maximum concentrations at SD016 and SD125 are an order of magnitude above historic results with the latest results in April 2023 being the highest. Remaining locations reported concentrations within historical ranges. Sediment locations SD016 and SD125 have co-located surface water samples SW016 and SW125, respectively, which detected new maximum concentrations in the monitoring period with April 2023 also having the highest results. Locations SW/SD016 and SW/SD125 receive surface water runoff from areas west of the main runway which includes Sub-Management Areas Two and Three. The elevated sediment results are potentially the result of above average rainfall over the monitoring period, mobilising sediments and increasing concentrations in surface water runoff over the monitoring period from on-base PFAS source areas.

Off-base concentrations of PFAS in sediment recorded some new historical maximum concentrations, however concentrations overall were within historical ranges for the off-base dataset during the monitoring period.

8.5.2 Mundy Creek catchment

Consistent with the previous monitoring period, SD113 and SD118 east of the base boundary presented the highest PFAS concentrations in the off-base area. These locations are downgradient of Sub-Management Area One and Sub-Management Area Two. Higher concentrations of PFAS were also identified in sediment at SD115 and SD117 along the same waterway. This is consistent with results from the previous 2020 reporting period.

During the monitoring period, on-base locations within the Mundy Creek catchment were stable for PFOA, PFOS and PFOS+PFHxS except at SD010 and SD132. Within the monitoring period, concentrations at SD010 were within the same order of magnitude as historical results with a new historical maximum reported for PFOS in April 2023. SD132 results were an order of magnitude higher in the April 2023 sample event compared to previous events. New historical maximum concentrations were also noted at SD132 co-located surface water sample SW132.

Location SW/SD132 is down-gradient of Sub Management Area One where PFAS remediation commenced in the second half of 2022 which also coincided with rainfall above historical average over the 2022/2023 wet season.

Concentrations at off-base locations during the monitoring period have also remained stable with no new maximums recorded except at SD108. The April 2023 event at SD108 detected new maximum concentrations of PFOS, PFOS and PFOS+PFHxS an order of magnitude above historical results. These new maximum results coincide with new maximum concentrations also being detected in the surface water sample SW108 for the same sample event. Location SW/SD108 is down-gradient of potential source areas but not sub-management areas. New historical maximums at SW/SD132 and SD108 and increasing concentrations at SD118 are potentially associated with remediation activities within Sub-Management Area One (in the case of SW/SD132) combined with above average rainfall potentially mobilising and depositing sediments within the catchment, however there is variability in sediment concentrations along the Mundy Creek Catchment drainage lines and point sources for these PFAS concentrations may be varied and potentially include both on-and off-base sources.

8.5.3 Three Mile Creek catchment

The highest concentration of PFOS+PFHxS in the Three Mile Creek Catchment were reported in one on-base sampling location, SD102, with a new historical maximum concentration of PFOS and PFOS+PFHxS in the October 2021 sampling event. The concentrations have since reduced progressively since October 2021. This location is at the northern end of the main runway and north of the Management Area. There is a pump at this location to transfer water from the runway, off-base, in times of flood with discharges to the former Rowes Bay Landfill area.

Off-base SD107 is downstream of SD102, located in a shallow wetland area. New historical maximum concentrations of PFOA, PFOS and PFOS+PFHxS were detected at SD107 in the latest May 2023 sample event, although within the same order of magnitude as historical results. The other off-base location, SD210, detected PFAS in the monitoring period within historical ranges.

8.5.4 Summary

Variability of concentrations of PFOA and PFOS+PFHxS in sediment across the Monitoring Area is generally within historical ranges. Further monitoring is required to understand any changes to the contamination profile at the following locations with potential increasing concentrations:

- SD132 (on-base Mundy Creek Catchment)
- SD108 (off-base Mundy Creek Catchment)
- SD016 and SD125 (on-base Bohle River/Louisa Creek/Town Common Catchment).

The current sampling locations and frequency are considered adequate to evaluate PFAS impacts in sediment on and off-base.

9.0 Conceptual site model

The CSM was developed during the investigation stages (WSP, 2018b; WSP, 2019a; WSP, 2019b) and summarised in the OMP (Department of Defence, 2020). The CSM summarises the linkages between sources, exposure pathways and receptors.

The sampling conducted over the monitoring period (December 2020 to May 2023) has provided additional data to further understand the nature and extent of PFAS concentrations in groundwater, surface water and sediment. Comparison to the available historical dataset indicates that PFAS concentrations in groundwater and surface water are relatively stable since the CSM was developed as part of the DSI (WSP, 2018b). Some fluctuation in the concentrations of individual PFAS compounds at individual monitoring locations is occurring, but the PFAS transport mechanisms and extent of the plume has not changed. The concentration range for groundwater, surface water and sediment monitoring locations, recorded during the monitoring period are shown in **Figures F9a to Figure F23b (Appendix A)**. One groundwater monitoring well with PFAS concentrations orders of magnitude outside of historical range (MW021) is within a previously defined source area and as such, the exposure scenario is covered by the existing CSM. The latest April 2023 PFAS results of one groundwater well off-base MW262 represent an order of magnitude increase and has exceeded drinking water guidelines since April 2021, although incomplete exposure pathway covered by the existing CSM is considered not to have changed. Some increases in surface water and sediment concentrations were seen both on-base and off base, particularly to the west of the base, however at present there has not been a change to the risk profile and the extent and nature of the PFAS detected remains stable.

The pathways for PFAS exposure and risks to human health and ecological receptors presented in the HHRA (WSP, 2018a), ecological risk assessment (WSP, 2019c) and PMAP (Department of Defence, 2020) are considered to be relevant and data presented in this report does not suggest any significant changes to these mechanisms or risks.

The data presented in this report do not change the understanding of the CSM. Future monitoring will continue to contribute to an evaluation of any potential changes to the CSM understanding and potential effects of potential seasonal trends on PFAS concentrations.

10.0 Discussion

10.1 Risk profile

The risk profile to human health and ecological receptors within the Monitoring and Management Areas is unchanged, based on the data assessment which identified that:

- Groundwater PFAS concentrations are relatively stable and consistent with figures presented in the 2017 DSI (WSP, 2018b), Seasonal Monitoring Reports (WSP, 2019a; WSP, 2019b) and the 2020 AIR (AECOM, 2021b).
- The overall PFAS plume extent has not changed significantly compared to historical results.
- Off-base well MW262 located in the Webb Drive industrial precinct in the Nohle River/Louisa Creek Catchment had a new exceedance of the human health screening levels for drinking water in April 2021 and has exceeded since. MW262 has historically detected PFAS, but the latest April 2023 results represent an order of magnitude increase. The risk assessment previously identified that off-Base groundwater was not used for drinking purposes and as this incomplete exposure pathway has not changed, the risk profile remains the same.
- PFAS concentrations in surface water and sediment samples were generally consistent with historical results with some increasing concentrations requiring continued seasonal monitoring to identify trends.

The available historical dataset compared to the data collected during the ongoing monitoring sampling events does not suggest a change in the risk profile for on- and off-base human health receptors associated with exposure to PFAS in groundwater and surface water.

Further monitoring is required to further assess potential seasonal trends and to further assess key groundwater and surface water locations on the base boundary and off-base locations which recorded historical maximum concentrations. There were some first-time detects or new exceedances of guideline values, however these locations are in areas and scenarios already included in the CSM and this does not represent a change to the risk profile.

Based on the data, AECOM considers that the conclusions made in the HHRA (WSP, 2018a), ERA (WSP, 2019c) and PMAP (Department of Defence, 2020) still apply.

10.2 Triggers for OMP Review

Following a review of the data collected during the current monitoring period (December 2020 to May 2023), there have been no changes to the understanding of risks associated with PFAS in the RAAF Base Townsville Monitoring and Management Areas, spatial distribution of PFAS, and the need for monitoring of additional media. Based on this, there are currently no triggers for review of the OMP.

11.0 Conclusions

Groundwater, surface water and sediment monitoring were completed as part of the OMP in April 2022, October 2022, April to May 2023 and rainfall event sampling was completed in December 2020, January 2022 and April 2023, in general accordance with the SAQP (AECOM, 2021a). Data from the DSI (WSP, 2018b), Seasonal Monitoring Reports completed in 2019 (WSP, 2019a; WSP, 2019b), and 2020 AIR (AECOM, 2021b) were included in this report to assess changes from historical conditions.

Whilst there are some PFAS concentration outliers for the monitoring period, generally groundwater PFAS concentrations are consistent with historical data and within the range of seasonal variability for wet and dry season conditions. While locations within Sub-Management Area One, Two and Three will require on-going monitoring to assess the long-term influence on areas down hydraulic gradient of source areas with elevated concentrations; overall, the nature and extent of PFAS in groundwater off-base has not changed from the understanding presented in the investigation phases and the PMAP (Department of Defence, 2020).

Concentrations of PFAS in surface water and sediment within the Mundy Creek, Bohle River/Louisa Creek/Town Common and Three Mile Creek catchments were generally within historical ranges with some seasonal variability noted. These locations are within areas which have historical exceeded adopted guidelines values and therefore the risk profile is unchanged.

PFAS concentrations in sediment reported during the monitoring period do not present a change to the risk profile.

Continued monitoring under the OMP is required to further assess potential seasonal trends across all environmental media and to further assess key groundwater and surface water locations on the base boundary and off-base locations which recorded historical maximum concentrations.

The CSM was reviewed, and no changes were identified to the sources, pathways or receptors at the base and within the Management Area. The objectives of the SAQP and OMP have been met.

Based on the data reviewed, no changes to the risk profile are recommended, and there are no triggers to review the OMP. Based on the data, AECOM considers that the conclusions made in the PFAS Management Area Plan (PMAP) (Department of Defence, 2020), HHRA (WSP, 2018a) and ERA (WSP, 2019c) still apply.

mbtoc - metres below top of casing
 TOC - top of casing
 mAHD - metres above Australian Height Datum
 DO - Dissolved Oxygen
 EC - Electrical Conductivity
 Redox - Redox Oxidation Potential
 Temp - Temperature
 mg/L - milligrams per litre

µS/cm - microsiemens per centimetre
 °C - degrees Celsius
 "-" denotes no analysis recorded
 mV - millivolt

* Anomalous groundwater elevation omitted from inferred groundwater contours

^ pH and total dissolved solids were mistakenly selected for analysis during the December 2020 sampling event and were therefore not selected for laboratory analysis in the February 2021 sampling event.

* Ionic balance cannot be calculated where concentrations of individual anions or cations are below the laboratory LOR.

Location ID	Sample Date	Sample Description	Odour
On-Base - Bohle River/Louisa Creek/Town Common Catchment			
SD013	29/04/2020	Silty SAND, fine grained, dark brown to black, saturated, highly organic (roots and decaying organic matter)	No odour
	9/09/2020	Sandy CLAY, low plasticity, fine sands, brown, dry, some organics	No odour
	22/04/2021	Silty CLAY, medium plasticity, brown, saturated, high organic content	Decaying organic odour
	7/10/2021	Silty SAND, dry, low to medium plasticity, soft, black, well graded fine sand component, with a trace of clay. With some organics (roots).	No odour
	13/04/2022	Sandy LOAM. Some fine gravels, minor silt, some organic content (plant material). No surface water present at time of sample collection.	No odour
	17/10/2022	Silty CLAY, dark brown, high organic material content, dry.	Earthy odour
	20/04/2023	Silty SAND, loose, black, fine subangular grained, black fine silt, saturated Wetland grass/organic matter present.	Organic
SD014	28/04/2020	Sandy GRAVEL, fine to coarse gravels, orange/black, saturated, with silt, and some organics (shells, root fibres)	Organic odour
	24/09/2020	Silty GRAVEL, dark brown/black, saturated, highly organic	Organic odour
	22/04/2021	Silty GRAVEL, coarse gravel, dark brown, saturated, low organic content	No odour
	7/10/2021	Gravelly sandy CLAY, saturated, medium to high plasticity, firm, dark grey to black, medium grained sands, medium to coarse sub-angular to angular gravel. With trace of organics and biota (roots, shells).	No odour
	13/04/2022	Sandy SILT. Dark red, minor organic content. Sampled from still, deep water beneath the bridge.	No odour
	7/10/2022	SAND, fine grained, poorly graded, wet.	No odour
	21/04/2023	CLAY, light brown, medium plasticity, firm, subangular gravel, saturated Moss/roots present.	No odour
SD016	29/04/2020	Silty CLAY, medium plasticity, black, saturated, highly organic	No odour
	7/09/2020	SILT, black, saturated, highly organic	No odour
	22/04/2021	Silty CLAY, low plasticity, grey to brown, saturated, high organic content	Decaying organic odour
	7/10/2021	Silty CLAY, saturated, medium to high plasticity, firm, dark grey, with trace of fine to medium grained sand.	No odour
	13/04/2022	Gravelly SAND. Poorly graded, dark brown, some biota and other plant material. Sampled from still water.	No odour
	17/10/2022	Silty CLAY, dark brown, high plasticity, with organic material.	No odour
	21/04/2023	SILT, loose, black, trace yellow sands, coarse, subangular, saturated Wetland grass present.	Strong Organic
SD019	30/04/2020	Clayey SAND, fine to medium grained, brown and black, wet	No odour
	10/09/2020	CLAY, medium plasticity, brown with grey/orange mottles, moist	No odour
	22/04/2021	Silty SAND, medium grained, loose, pale brown, moist	No odour
	7/10/2021	CLAY, moist, medium to high plasticity, soft, brown to grey with red to brown mottling, with a trace of fine grained sand. With organics (roots).	No odour
	21/04/2022	SAND. Fine grained, black, high organic content (biota, grass and roots). Sampled from very slowly flowing water.	No odour
	17/10/2022	CLAY, high plasticity, light brown, with traces of cobbles and gravels, with organic material (roots), dry.+	No odour
	21/04/2023	CLAY, light grey, medium plasticity, trace coarse sands, saturated Snails present.	No odour
SD112	29/04/2020	Silty CLAY, low plasticity, grey, saturated, with organic matter (root fibres)	No odour
	9/09/2020	Clayey SAND, fine to medium grained, grey with orange mottles, with organics (decaying organic matter and shells)	No odour
	16/04/2021	Sandy Gravelly SILT, non-plastic, grey, saturated, with medium sands and fine gravels, with some clay inclusions and high organic content (leaves and roots)	No odour
	7/10/2021	Sandy GRAVEL, saturated, medium to coarse, sub-angular to angular gravels, loose, black, coarse sands. With organics and biota (roots, shells).	No odour
	12/04/2022	Sandy SILT. Low plasticity, high organic content (rootlets).	No odour
	7/10/2022	Sandy CLAY, soft, light grey, low plasticity, fine to medium grained sand, well graded, wet.	No odour
	21/04/2023	CLAY, light grey, medium plasticity, firm, saturated Grass/roots present.	No odour
SD123	29/04/2020	Sandy CLAY, low plasticity, black, moist, with fine grained sands, highly organic	No odour
	10/09/2020	Gravelly SILT layer, then grey sandy CLAY, medium plasticity, fine sands, saturated, some organics	No odour
	22/04/2021	Sandy CLAY, low plasticity, orange to brown, moist, medium grained sands, with a trace of coarse gravel, medium organic content	No odour
	7/10/2021	Sandy CLAY, saturated, medium plasticity, firm, dark brown to dark grey, well graded fine grained sand. With organics (roots, leaves).	No odour
	21/04/2022	Sandy CLAY. Surface gravel, poor plasticity. Sampled from stagnant pond.	No odour
	17/10/2022	Sandy CLAY, grey to brown, high plasticity, saturated. Sampled close to culvert.	No odour
	21/04/2023	CLAY, light grey, medium plasticity, subangular pebbles	No odour
SD125	27/04/2020	Silty CLAY, low plasticity, black, saturated, highly organic	No odour
	7/09/2020	Silty CLAY, dark grey-black, saturated, highly organic	No odour
	22/04/2021	Gravelly CLAY, low plasticity, grey to brown, saturated, fine to coarse gravels, low organic content	No odour
	7/10/2021	Silty CLAY, dry, medium to high plasticity, soft, dark brown. With trace of organics (roots).	No odour
	13/04/2022	Silty CLAY. Medium plasticity, minor organic material (plant material). Sampled from still water.	No odour
	17/10/2022	CLAY, light and dark brown, traces of gravel, trace organic material, dry. Sampled away from surface water due to restricted access.	No odour
	21/04/2023	Sandy CLAY, dark grey, low plasticity, trace coarse sands, saturated Algae present.	Moderate Organic
SD126	29/04/2020	Gravelly CLAY, medium plasticity, brown with orange/black/grey/brown mottle, fine to medium sized gravels, moist, highly organic	No odour
	9/09/2020	CLAY, low to medium plasticity, black to grey, moist, with medium sized gravels and organics (shells)	No odour
	22/04/2021	Gravelly SILT, non-plastic, dark brown, saturated, fine gravels, high organic content	Organic odour
	7/10/2021	CLAY, wet, high plasticity, firm, brown to dark grey, with a trace of coarse grained sand and fine angular gravels. Highly organic (roots, grass).	No odour
	13/04/2022	Silty CLAY. Low plasticity, brown, high organic content (rootlets). Sampled from lake.	No odour
	19/10/2022	NOT SAMPLED. Surface too rocky. No accessible sediment for sample.	No odour
	20/04/2023	Silty SAND, loose, brown, fine subangular grained, fine silt, saturated Wetland grass/organic matter present.	No odour

Location ID	Sample Date	Sample Description	Odour
SD131	29/04/2020	CLAY, high plasticity, dark brown, saturated, with organics	No odour
	9/09/2020	CLAY, medium plasticity, grey, saturated, with organics	No odour
	16/04/2021	Silty CLAY, low plasticity, dark grey, saturated, with high organic content (leaves and roots)	Slight sulfur odour
	7/10/2021	Silty CLAY, saturated, low to medium plasticity, firm, dark grey to black. Highly organic (roots, sticks, grass).	No odour
	13/04/2022	Clayey SILT. Medium plasticity, dark grey, high organic content (plant material). Sampled from still water.	Organic odour
	19/10/2022	CLAY, soft, dark brown/black, medium plasticity, with organic material (roots), wet.	No odour
	21/04/2023	CLAY, dark grey, high plasticity, firm, saturated Wetland grass present.	Moderate Organic
On-Base - Mundy Creek Catchment			
SD001	28/04/2020	SAND, medium to coarse grained, dark brown, saturated	No odour
	23/09/2020	SILT, low plasticity, dark brown, moist, highly organic	Organic odour
	22/04/2021	Silty GRAVEL, medium gravel, very loose, brown, saturated	No odour
	7/10/2021	SAND, saturated, well graded medium grained sand, soft, yellow to brown.	No odour
	13/04/2022	Sandy GRAVEL. Medium-coarse, poorly graded, reddish brown colour. Sampled from slowly flowing water in concrete culvert.	No odour
	17/10/2022	Gravelly CLAY, light brown, trace angular gravels and cobbles, dry. Sampled from top of culvert due to hard/compact surface.	No odour
	20/04/2023	Silty SAND, loose, yellow, coarse subangular grained, black fine silt, saturated Algae/roots present.	No odour
SD010	28/04/2020	Silty CLAY, low plasticity, dark brown, moist, with organics	No odour
	23/09/2020	Silty CLAY, medium plasticity, brown with orange mottles, some coarse gravels and organics (shells)	No odour
	22/04/2021	Sandy CLAY, high plasticity, orange to brown, saturated, with a trace of medium gravels and some organic content	Organic odour
	7/10/2021	Clayey SAND, saturated, well graded, fine grained, soft, dark grey, medium plasticity clay component. With some organics (roots).	No odour
	13/04/2022	Silty SAND. Well graded, black, high organic content. Sampled from stagnant water at end of culvert.	No odour
	17/10/2022	Silty CLAY, black, high plasticity, with organic materials (roots), saturated. Sampled from culvert.	No odour
	21/04/2023	Silty SAND, loose, yellow, coarse subangular, dark brown, fine, saturated Grass/Roots present.	No odour
SD106	25/04/2020	SILT, black saturated, with traces of clay. Floating slime (organic)	Putrid odour
	23/09/2020	Silty CLAY, low to medium plasticity, black with red/yellow mottles, saturated	Organic odour
	11/10/2021	Silty CLAY, dry, medium plasticity, hard, dark brown. Dry salt crystals observed on surface.	No odour
	13/04/2022	Silty CLAY. Medium plasticity, dark brown, high organic material (plant material). Sampled from shallow flowing water.	No odour
	17/10/2022	Silty CLAY, black, trace organic material. Sampled on bank under Mangroves.	Salty/Mangrove odour.
SD121	25/04/2020	SILT, black, highly organic, moist, overlaying CLAY, black with grey and brown/orange, low plasticity, moist, with a trace of organics	No odour
	23/09/2020	Sandy CLAY, dark brown, fine sands, dry, low organic content	No odour
	22/04/2021	Clayey SILT, non-plastic, dark brown, saturated, high organic content	Organic odour
	7/10/2021	Clayey SILT, moist, non-plastic, soft, dark brown. Highly organic (roots).	No odour
	13/04/2022	Sandy LOAM. Low plasticity, black. Some organic material (rootlets).	No odour
	17/10/2022	Silty CLAY, black, high plasticity, with organic materials (roots), moist. Sampled under grass.	No odour
	21/04/2023	SILT, loose, black, saturated Grass present.	Weak Organic
SD132	28/04/2020	SAND, medium to coarse grained, orange/brown, saturated, with some angular to sub angular medium gravels and organics	Decaying odour
	23/09/2020	Gravelly SAND, yellow/brown, some silt and organics (roots)	No odour
	22/04/2021	GRAVEL, fine to medium sub rounded to sub angular gravel, very loose, brown, saturated	No odour
	13/04/2022	SAND. Medium-coarse, poorly graded, minor silt content, reddish brown to black, minor organic content. Sampled from slowly flowing water in concrete culvert.	No odour
	17/10/2022	Silty SAND, dark brown, with organic materials (roots), dry. Sampled from culvert.	No odour
	21/04/2023	CLAY, medium plasticity, dark brown, loose, saturated Roots present.	Weak Organic
On-Base - Three Mile Creek Catchment			
SD102	29/04/2020	Silty SAND, medium to coarse grained, brown/black, saturated, with some fine to medium sized gravels and trace organics	No odour
	9/09/2020	SILT, black, saturated with some organics (shells)	Putrid odour
	22/04/2021	Gravelly CLAY, low plasticity, grey to brown, saturated, fine gravels, low organic content	No odour
	7/10/2021	SILT, saturated, non-plastic, soft, dark grey to black. Highly organic (roots, leaves, decaying matter).	Strong organic/sulfurous odour
	13/04/2022	Clayey SILT. Medium plasticity, brown-black, trace organic content (plant material). Sampled from flowing concrete culvert.	No odour
	17/10/2022	Silty CLAY, black to brown, high plasticity, fine grained sand, with organic material. Sampled from culvert.	Fish/Marine odour.
	21/04/2023	SILT, loose, black, saturated Roots/Grass present.	Weak Organic

Location ID	Sample Date	Sample Description	Odour
Off-Base - Bohle River/Louisa Creek/Town Common Catchment			
SD017	8/09/2020	CLAY, high plasticity, light brown with orange mottles, moist	Decaying odour
	15/04/2021	Silty SAND, coarse grained, black, saturated, high organic content (roots)	No odour
	6/10/2021	SAND, saturated, medium to coarse grained, soft, black and yellow to orange.	No odour
	11/04/2022	Silty GRAVEL. Black, angular gravels, very stiff matrix, high organic component (grass). Sampled from marshy creek.	No odour
	7/10/2022	Sandy GRAVEL, medium to large grained, poorly graded, some organic material (roots and plants), wet. Area adjacent to sample recently mowed, lots of loose grass.	No odour
	21/04/2023	Silty SAND, loose, yellow, coarse grained, dark brown silt, saturated Grass/Roots present.	No odour
SD021	29/04/2020	Silty CLAY, grey and orange, saturated, with some fine to medium grained sands and organic matter (tree roots)	No odour
	8/09/2020	Silty SAND, fine to medium grained, black, saturated, with organic matter (tree roots)	Sulfur odour
	15/04/2021	Clayey SAND, coarse grained, dark grey, saturated, with organic matter (roots)	No odour
	6/10/2021	Top Layer: SAND, saturated, well graded medium grained, soft, grey. Bottom Layer: CLAY, saturated, medium plasticity, soft, grey, with trace of fine grained sand.	No odour
	11/04/2022	Sandy GRAVEL. Grey, sub-angular, high organic component (grass). Sampled from earthen drain.	No odour
	7/10/2022	Silty SAND, dark brown, low plasticity, fine grained, lots of organic material (roots), wet.	No odour
SD110	3/05/2023	Sandy CLAY, very soft, dark grey, low plasticity, fine grained sand, saturated Root matter present.	No odour
	17/04/2020	SILT, black, slightly organic with some fine grained sands, saturated	No odour
	21/09/2020	CLAY, medium plasticity, dark grey, saturated, with organics and very fine sand	Organic odour
	20/04/2021	Silty CLAY, medium plasticity, black, moist, soft, high organic content	No odour
	6/10/2021	Silty CLAY, saturated, medium plasticity, soft, black, with a trace of fine, well graded sand. Highly organic (roots, sticks, leaves).	No odour
	12/04/2022	Sandy SILT. Black, well graded, low plasticity, high organic matter content.	Organic odour
SD111	14/10/2022	SAND, dark and light brown, fine grained, trace gravel. Sample taken from across surface water due to restricted access.	No odour
	3/05/2023	Silty CLAY, very soft, black, low, plasticity, saturated Organic matter leaves/branches present.	No odour
	17/04/2020	SILT, black, saturated, highly organic with some fine sands	Slight sulfur odour
	21/09/2020	Sandy CLAY, low plasticity, dark grey/brown, saturated, with organics and fine sand	Organic odour
	20/04/2021	Silty CLAY, medium plasticity, black, moist, soft, high organic content	No odour
	6/10/2021	Silty CLAY, saturated, medium plasticity, soft, black, with a trace of fine, well graded sand. Highly organic (roots, sticks, leaves).	Compost/putrefied odour
SD120	13/04/2022	Sandy SILT. Brown, well graded, low plasticity, high organic matter content. Stagnant water present.	Organic odour
	14/10/2022	Silty CLAY, high plasticity, fine grained, trace organic material.	No odour
	3/05/2023	Silty CLAY, very soft, black, low, plasticity, saturated Organic matter leaves/branches present.	No odour
	29/04/2020	Silty SAND, with clay, medium grained, grey/black, saturated, with organic matter (tree roots)	Slight sulfur odour
	9/09/2020	Clayey SAND, fine to medium grained, black with orange/grey mottles, firm and some organics	No odour
	15/04/2021	Sandy CLAY, low plasticity, black and brown, saturated, coarse subangular sands and some organics (roots)	No odour
SD127	6/10/2021	SAND, saturated, medium to coarse grained, soft, black, with a trace of silt. With trace of organics (roots).	No odour
	11/04/2022	Silty GRAVEL. Large angular rock fragments, very stiff, black with light brown mottle, some organic content (rootlets). Sampled from earthen drain.	No odour
	7/10/2022	Sandy GRAVEL, dark brown, medium grain, poorly graded, with organic material (roots and plants), moist.	No odour
	3/05/2023	Clayey SAND, very loose, dark grey, fine to medium subangular grained, saturated	No odour
	16/04/2020	Silty SAND, with some gravels, black, saturated, with some clay	No odour
	24/09/2020	Gravelly SAND, brown/black with orange and yellow sands/gravels, overlaying CLAY, medium plasticity, dark grey, saturated, some fine sands	-
SD129	6/10/2021	Clayey SILT, saturated, non-plastic, soft, black. Highly organic (roots, sticks, leaves).	No odour
	11/04/2022	Silty GRAVEL. Large angular rock fragments, very stiff, dark brown, some organic content (rootlets). Sampled from concrete culvert.	No odour
	7/10/2022	Silty SAND, soft, dark brown, poorly graded, with organic material (roots and leaves), wet.	No odour
	21/04/2023	SAND, black, loose, coarse, subangular pebbles, saturated	No odour
	16/04/2020	Dark brown SAND layer, then black CLAY, with organics, fine to medium grained sands, saturated, some medium gravels	No odour
	24/09/2020	Silty SAND, black, saturated, some angular gravels	No odour
SD201	20/04/2021	Clayey SAND, fine grained, grey with red to orange mottles, loose, saturated, with a trace of silt	No odour
	6/10/2021	CLAY, saturated, medium plasticity, soft, dark brown to black, with a trace of medium angular gravels. With trace of organics (leaves).	No odour
	11/04/2022	Sandy GRAVEL. Sub-angular pebbles. Sampled from Bohle River.	No odour
	7/10/2022	SAND, dark brown, medium grained, poorly graded, with silt, wet.	No odour
	21/04/2023	CLAY, loose, dark brown, low plasticity, saturated	No odour
	16/04/2020	SAND, fine to medium grained, brown and black, saturated, with some medium gravels	No odour
SD201	6/10/2021	SAND, saturated, well graded, fine to medium grained, soft, black.	Brackish odour
	11/04/2022	Silty SAND. Black with grey mottles.	Organic odour
	14/10/2022	SAND, pale yellow-brown, fine grained, with organic material, moist.	No odour
	3/05/2023	SAND, very loose, brown, fine to coarse grained, subangular, saturated	No odour

Table T6: Sediment Field Observations

Location ID	Sample Date	Sample Description	Odour
SD202	29/04/2020	Sandy CLAY, low plasticity, black, saturated, with medium grained sands	Sulfur odour
	8/09/2020	Silty Sandy CLAY, low plasticity, black and grey, saturated, with medium grained sands	No odour
	15/04/2021	Clayey SILT, low plasticity, grey, saturated, with trace of fine grained sands	No odour
	29/09/2021	Sandy silty CLAY, saturated, medium plasticity, soft, dark brown, fine sand component. Mud crab observed (not in sample), slight biosheen on water surface.	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown, high plasticity with trace sands, saturated. Sampled on bank under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
SD203	29/04/2020	Sandy CLAY, low plasticity, grey/black, saturated, with medium grained sands	No odour
	8/09/2020	SILT, black, firm, saturated, with fine to coarse grained sands	No odour
	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with organic inclusions	No odour
	29/09/2021	Sandy silty CLAY, saturated, medium plasticity, soft, dark brown, fine sand component, with inclusions of high plasticity dark grey clay.	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown with some black with orange mottling, high plasticity, trace sands, with organic material (roots), moist. Sampled on river bed under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
SD204	29/04/2020	Sandy CLAY, low plasticity, grey/black, saturated, with medium grained sands	No odour
	8/09/2020	CLAY, medium plasticity, dark grey, moist, dense	No odour
	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with shells	No odour
	29/09/2021	Silty CLAY, saturated, medium plasticity, soft, dark brown.	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown and black, high plasticity, trace sands, with organic material (roots) moist. Sampled on river bed under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
SD205	29/04/2020	Sandy silty CLAY, low plasticity, brown and black, saturated, with organic matter (root fibres)	No odour
	8/09/2020	CLAY, medium plasticity, grey with black/brown mottles, moist, some medium grained sands	No odour
	15/04/2021	Sandy CLAY, low plasticity, grey with orange inclusions, saturated, coarse grained sands, with silt	No odour
	29/09/2021	Sandy silty CLAY, saturated, medium plasticity, soft, dark brown, fine sand component, with some inclusions of grey non-uniform medium grained sands.	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown, high plasticity, trace sand, organic material (shells, biota), saturated. Sampled on river bed under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
SD206	29/04/2020	CLAY, low plasticity, blue/grey, saturated, with fine grained sands and organic matter (root fibres)	No odour
	8/09/2020	Sandy CLAY, low to medium plasticity, dark grey, saturated, with medium grained sands	No odour
	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with organic inclusions	No odour
	29/09/2021	Sandy silty CLAY, saturated, medium plasticity, soft, dark brown, fine sand component.	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown, high plasticity, trace sand, with organic material (roots), saturated. Sampled on river bed under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
SD207	29/04/2020	Sandy CLAY, low plasticity, black, saturated, with medium grained sands	No odour
	8/09/2020	CLAY, low to medium plasticity, brown with grey/orange mottles, moist, with medium grained sands and organic (shell fragments)	No odour
	15/04/2021	Sandy CLAY, medium plasticity, brown, saturated, with some fine angular gravels	No odour
	29/09/2021	Sandy silty CLAY, saturated, medium plasticity, soft, dark brown, fine sand component, some organics (mangrove roots).	Coastal/mangrove mud odour
	5/05/2022	Silty CLAY. Low to medium plasticity, dark brown, soft, trace of fine sands.	Coastal/mangrove mud odour
	18/10/2022	Silty CLAY, soft, dark brown to black, high plasticity, with trace sands, with organic material (roots), saturated. Sampled on river bed under Mangroves.	Salty/Mangrove odour.
	11/04/2023	CLAY, soft, grey, muddy with smaller to medium sized subangular, moist	No odour
Off-Base - Mundy Creek Catchment			
SD108	15/04/2020	SILT, black, saturated, some organics	No odour
	21/09/2020	Clayey SAND, fine to medium grained, light brown, saturated	No odour
	20/04/2021	Silty SAND, fine grained, grey to black, moist, loose, high organic content	Organic odour
	6/10/2021	Silty CLAY, saturated, low plasticity, firm, dark brown to grey.	Organic/sulfurous odour
	17/04/2022	CLAY. High plasticity, brown colour, some minor coarse fragments. Sampled from ponded water in creek.	Organic odour
	14/10/2022	Silty CLAY, dark grey to dark brown, high plasticity, fine grained. Sampled on bank under Mangroves.	Organic (mud) odour.
	21/04/2023	SILT, black, loose, saturated, coarse yellow sands trace Leaves/Grass present.	Strong Organic
SD109	15/04/2020	SILT, black, some gravels, saturated	No odour
	21/09/2020	Clayey SAND, fine grained, dark grey, saturated	No odour
	20/04/2021	Silty SAND, fine grained, grey to brown, moist, loose, some broken shells and some medium to coarse subangular gravels	No odour
	6/10/2021	SAND, saturated, well graded, medium grained, soft, yellow.	No odour
	17/04/2022	SAND. Coarse, well graded, trace organics. Sampled from creek, under bridge.	No odour
	7/10/2022	SILT, brown, medium plasticity, with organic material (some marine shell), wet.	No odour
	21/04/2023	Sandy CLAY, dark grey/black, medium plasticity, firm, yellow coarse sands, saturated Shells present.	Moderate Organic

Table T6: Sediment Field Observations

Location ID	Sample Date	Sample Description	Odour
SD113	16/04/2020	Silty CLAY, black, saturated	Strong sulfur odour
	23/09/2020	CLAY, high plasticity, dark brown to black, moist, stiff, with organics	No odour
	6/05/2021	Silty CLAY, dark grey, saturated, with some organic content	Distinct sulfur odour
	6/10/2021	Clayey SAND, saturated, well graded, fine to medium grained, firm, black, medium plasticity clay component. With some organics (roots).	No odour
	17/04/2022	SAND. Medium-coarse, poorly graded, black, high organic content (plant material). Sampled from still pond covered in lilies.	No odour
	7/10/2022	Sandy CLAY, dark brown, fine grained, poorly graded, with organic materials (roots and algae), wet.	No odour
	3/05/2023	Silty CLAY, very soft, black, low, plasticity, saturated Organic matter leaves/branches present.	No odour
SD114	15/04/2020	Silty CLAY, black, saturated, some organics (tree roots)	Sulfur odour
	21/09/2020	Clayey SILT, low plasticity, dark grey to black, saturated, with organics (roots)	Sulfur odour
	22/04/2021	Sandy CLAY, high plasticity, soft, red, orange and brown mottles, saturated	No odour
	6/10/2021	Silty CLAY, saturated, low plasticity, firm, dark brown to black. Highly organic (roots).	No odour
	11/04/2022	Silty CLAY. Dark brown, medium plasticity, minor organic content (plant material). Sampled from creek.	No odour
	7/10/2022	SILT, dark brown, low plasticity, wet.	No odour
	22/04/2023	CLAY, dark brown/black, high plasticity, firm, saturated Leaves/Roots present.	Moderate Organic
SD115	15/04/2020	Silty SAND, black, saturated, with organics	Slight sulfur odour
	21/09/2020	SILT, low plasticity, black, saturated, with organics	Sulfur odour
	16/04/2021	Silty CLAY, low plasticity, black, saturated, with some medium grained sands, some organic content (leaves)	No odour
	6/10/2021	CLAY, saturated, medium plasticity, firm, dark brown to black, with a trace of coarse angular gravels. With some organics (roots).	No odour
	17/04/2022	Sandy SILT. Dark brown colour. Minor organic material (roots). Sampled from earthen creek.	No odour
	7/10/2022	Silty CLAY, brown, medium plasticity, wet.	No odour
	21/04/2023	CLAY, dark brown/black, medium plasticity, saturated, loose Roots/Leaves present.	Moderate Organic
SD116	15/04/2020	Silty gravelly SAND, black, saturated, with organics	No odour
	21/09/2020	Gravelly CLAY, low plasticity, dark brown, saturated, some medium to coarse gravels	No odour
	20/04/2021	CLAY, high plasticity, brown with black mottles, saturated, firm, some coarse sands and coarse angular gravels, with a trace of organic content	Organic odour
	6/10/2021	Gravelly CLAY, saturated, medium to high plasticity, firm, dark brown to black, fine to coarse angular gravels.	No odour
	17/04/2022	Sandy SILT. Medium plasticity, dark brown, some organic content (roots, leaves). Sampled from turbid water beneath bridge.	Organic odour
	14/10/2022	Silty CLAY, brown, high plasticity, organic materials (some shell). Sampled on bank under Mangroves.	No odour
	21/04/2023	SAND, black, coarse, loose, saturated, subangular pebble inclusions Roots present.	Moderate Organic
SD117	16/04/2020	SILT, black, saturated, slightly organic	Decaying odour
	21/09/2020	Clayey SILT, low plasticity, black, saturated, organic matter	Sulfur odour
	16/04/2021	Silty Gravelly CLAY, low plasticity, black, saturated, fine to medium sub angular gravels, high organic content (leaves and sticks)	Distinct sulfur odour
	7/10/2021	Sandy SILT, saturated, non-plastic, soft, black, medium grained sand component. Highly organic (roots, sticks, leaves).	No odour
	11/04/2022	Silty SAND. Dark brown, low cohesion, sub-angular grains. Some organic matter present (leaves and roots). Sampled from concrete culvert.	Slight sulfurous odour
	7/10/2022	Silty SAND, dark brown, fine grained, poorly graded, organic material (some roots), dry.	No odour
	21/04/2023	SILT, loose, dark brown, saturated Leaves/Roots present.	No odour
SD118	16/04/2020	SILT, black, saturated, with organics	No odour
	21/09/2020	SILT, low plasticity, black, saturated, with organics	Sulfur odour
	16/04/2021	Sandy CLAY, low plasticity, black to grey, saturated, coarse sands, with fine layer of silt at surface, high organic content (leaves and sticks)	Decaying organic odour
	7/10/2021	Silty CLAY, saturated, low to medium plasticity, soft, dark brown to black. With some organics (roots, leaves).	Putrefied odour
	11/04/2022	Silty SAND. Dark grey-brown, moderately cohesive. Sampled from shallow creek.	Sulfurous odour
	7/10/2022	Silty CLAY, dark brown, fine grained, wet.	Salty/Organic odour
	21/04/2023	CLAY, light grey, moderate plasticity, saturated, loose Grass present.	No odour
SD119	16/04/2020	Gravelly SAND, medium to coarse sands, fine gravels brown, saturated, with some organics	No odour
	23/09/2020	Sandy CLAY, low plasticity, dark brown with black mottles, some fine to medium gravels and organics	Organic odour
	6/10/2021	Silty sandy GRAVEL, saturated, fine sub angular to angular gravels, soft, black, medium to coarse sands.	No odour
	11/04/2022	Sandy GRAVEL. Sub-angular, some organic content (algae). Sampled from concrete culvert.	No odour
	7/10/2022	SAND, pale brown, poorly graded, dry. Sampled above the concrete culvert airside.	No odour
	22/04/2023	SAND, dark brown, coarse, loose, subangular pebble inclusions, saturated Leaves present.	No odour

Table T6: Sediment Field Observations

Location ID	Sample Date	Sample Description	Odour
SD208	15/04/2020	Sandy SILT, black, saturated	No odour
	21/09/2020	Sandy Gravelly CLAY, low plasticity, dark grey to brown, saturated, some coarse sands, find to medium gravels and organics (roots)	No odour
	20/04/2021	CLAY, medium to high plasticity, black with red to orange mottles, moist, soft, with a trace of coarse angular sands and some organic content	Organic odour
	6/10/2021	CLAY, wet to saturated, medium to high plasticity, firm, dark brown to black.	No odour
	12/04/2022	Sandy CLAY. Brown, high plasticity, minor organic content	Organic odour
	14/10/2022	Silty CLAY, dark brown, high plasticity, trace sand and gravels. Sampled on bank under Mangroves.	No odour
	22/04/2023	SAND, light brown/yellow, coarse, subangular pebble inclusions, saturated Shells present.	No odour
SD209	25/04/2020	Silty CLAY, black, saturated, highly organic	Sulfur odour
	23/09/2020	Silty CLAY, high plasticity, black, saturated, with organics (roots)	No odour
	11/10/2021	Silty CLAY, dry, medium plasticity, hard, dark brown. Dry salt crystals observed on surface.	No odour
	13/04/2022	Silty CLAY. Medium plasticity, dark grey/brown colour, high organic content (plant material). Sampled from slow flowing creek.	No odour
	7/10/2022	SILT, dark brown to black, low plasticity, wet.	No odour
Off-Base - Three Mile Creek Catchment			
SD107	15/04/2020	SILT, black, high levels of leaf and organic matter, saturated	Strong sulfur odour
	21/09/2020	CLAY, low plasticity, black, moist, traces of sands	No odour
	20/04/2021	SILT, non-plastic, black, moist, soft, high organic and decomposing organic content	Organic odour
	6/10/2021	Silty CLAY, dry, medium plasticity, hard, black. Dry salt crystals observed on surface.	Saline odour
	12/04/2022	Sandy SILT. Medium plasticity, well graded, brown, high organic content (leaves).	Organic odour
	14/10/2022	CLAY, black, high plasticity, moist. Animal prints across sediment surface.	Salty/Organic odour.
	3/05/2023	Silty CLAY, very soft, black, low, plasticity, saturated Organic matter leaves/branches present.	No odour
SD210	15/04/2020	SILT with sand, black-brown, mangrove roots, saturated	No odour
	21/09/2020	Sandy CLAY, low plasticity, brown/orange, saturated, with some sands and gravels	No odour
	16/04/2021	Sandy Clayey SILT, non-plastic, dark grey, saturated, fine sands, with some organic content (leaves and roots)	No odour
	6/10/2021	Sandy CLAY, saturated, low to medium plasticity, soft, dark brown to black, fine grained sand component, with trace of coarse angular gravels.	Coastal/mangrove mud odour
	12/04/2022	Clayey SILT. Medium plasticity, well graded dark grey-brown, high organic content.	No odour
	14/10/2022	Silty CLAY, dark brown, high plasticity, trace organics.	No odour
	22/04/2023	CLAY, light grey/black, firm, high plasticity, saturated	Slight Organic

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has prepared this Sampling and Analysis Quality Plan (SAQP) for the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program at RAAF Townsville (the “Base”) and the RAAF Townsville Management Area in the North Queensland Region, as defined in the *PFAS Management Area Plan (PMAP)*, (Defence, 2019).

The SAQP supports the *PFAS Ongoing Monitoring Plan (OMP)* which forms part of the *RAAF Base Townsville PMAP*, herein referred to as the OMP.

The purpose of the OMP is to collect data to enable Defence to maintain an up to date understanding of the distribution, concentration and transport (migration pathways and flow) of PFAS at the Base and the RAAF Townsville Management Area. The data will assist in the timely identification of risks and inform Department of Defence’s (Defence) approach to the management of PFAS, including updates and revisions to the PMAP. Deviations from the OMP are noted in **Table 22, Section 4.15**.

1.2 SAQP Objectives

The objectives of this SAQP are to:

- Outline the proposed monitoring locations;
- Outline the adopted sampling methodology; and
- Outline the adopted data quality assurance and quality control (QA/QC) measures.

1.3 Scope of Works

To meet the project objectives, the following scope of works are proposed as per the OMP (Defence, 2019):

- Annual comprehensive post-wet season sampling event in April 2020, April 2021, April 2022, April 2023 and April 2024 including:
 - Groundwater gauging of 29 selected monitoring wells;
 - Groundwater sampling of 107 monitoring wells;
 - Surface water sampling at 42 locations (provided water is present), co-located with 42 sediment sampling locations.
- Targeted post-dry season sampling event in October 2020, October 2021, October 2022 and October 2023 including:
 - Groundwater gauging of 29 monitoring wells;
 - Groundwater sampling of 82 monitoring wells; and
 - Surface water sampling at 42 locations (provided water is present), co-located with 42 sediment sampling locations.
- Rainfall event-based sampling in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au website or 100 mm of cumulative rainfall over a 7-day period including:
 - Surface water sampling at 19 locations, daily for a period of 5 days, limited to one event per calendar year.
- Preparation of reports including a sampling event factual report (following each biannual or high rainfall sampling event) and annual interpretative reports following the completion of each 12-month sampling period.

1.4 Previous Investigations

A list of relevant published documents is provided below:

- GHD Australia Pty Ltd (GHD) (2016). Defence per- and poly-fluoroalkyl Substances (PFAS) Environmental Management Preliminary Sampling Program RAAF Base Townsville. September
- WSP Australia Pty Limited (WSP) 2018a. RAAF Base Townsville Detailed Site Investigation – PFAS. May
- WSP 2018b. RAAF Base Townsville Human Health Risk Assessment (HHRA). October
- Defence (2019). PFAS Management Area Plan – RAAF Townsville.
- WSP 2019a. RAAF Townsville - Seasonal Monitoring Report 1 – PFAS. December
- WSP 2019b. RAAF Townsville - Seasonal Monitoring Report 2 – PFAS. December
- WSP 2019c. RAAF Townsville – Ecological Risk Assessment (ERA). December
- AECOM (2021d). Annual Interpretive Report 2020, PFAS OMP - RAAF Base Townsville. June

1.5 Guidelines and Legislation

The SAQP has been developed with reference to the following guidelines and legislation:

- Heads of Environmental Protection Agencies (HEPA), (2020), PFAS National Environmental Management Plan (NEMP) 2.0.
- National Environment Protection Council (NEPC), (1999, as amended 2013) National Environment Protection (Assessment of Site Contamination) Measure (NEPM).
- Defence (2018), Routine Environment Water Quality Monitoring Manual.
- Defence (2018 amended June 2021) Contamination Management Manual (DCMM).
- Department of Health (DoH), (2019), Health Based Guidance Values for PFAS for use in site investigations in Australia.
- National Health and Medical Research Council (NHMRC), (2019), Guidance on PFAS in Recreational Water.
- Standards Australia (1998). AS/NZ 5667:1998 Water Quality - Sampling - Guidance on Sampling of Groundwaters.
- Australian and New Zealand Governments (ANZG), 2018. Australian and New Zealand Guidelines for Fresh and Marine Water Quality.
- State of Queensland (2019), Environmental Protection (Water and Wetland Biodiversity) Policy,.

2.0 Site Setting and Conceptual Site Model

2.1 Site Description

RAAF Townsville is located in Garbutt, a suburb of Townsville in North Queensland, approximately 5 km from Townsville City. The Base has operated as an airfield since the late 1930's and the two runways are now shared with the Townsville Civilian Airport. The Base is subject to a large range of operational uses including but not limited to four military units, accommodation for officers and transit personnel, a fire station, current and former fire training grounds, fuel farms and an aircraft runway.

The Management Area comprises the limits of the Base which is adjacent to Townsville Airport, residential and commercial suburbs of Garbutt, Rowes Bay, West End, Belgian Gardens, Pallarenda, Mount St John, Mount Louisa, Bohle and the Townsville Town Common wetlands (the Town Common). Three discrete Sub-Management Areas exist within the Base, as outlined in **Table 1** and shown in **Appendix B**. The Monitoring Area encompasses the Base and surrounds.

Table 1 Sub-Management Areas on Base

Sub-Management Area	Purpose
Sub-Management Area 1: Former Fire Training Area, CSR_QLD_000246	This area is located in the south-eastern portion of the Base and is the source area to Mundy Creek Catchment. Historically the area was used for routine fire training activities and testing of aqueous film-forming foam (AFFF) mixing (WSP, 2018a).
Sub-Management Area 2: Former Fire Training Area, CSR_QLD_000244 Fire Station, CSR_QLD_000245 Fuel Farm 2, CSR_QLD_000351	This area is located in the centre of the Base and is a source area for Louisa Creek Catchment and the Townsville Town Common. Historically the area was used for fire training activities, equipment testing and had possible AFFF spills (WSP, 2018a).
Sub-Management Area 3: 5 Aviation (5AVN) (includes CSR_QLD_000349, CSR_QLD_000358, CSR_QLD_000475, CSR_QLD_000637)	This area is located in the south-western section of the Base and is a source area for Louisa Creek Catchment and the Townsville Town Common. Historically the area was used for equipment testing and AFFF storage and had possible AFFF spills (WSP, 2018a).

The Monitoring Area includes the Base and surrounds in which monitoring is occurring in line with the OMP. Adjoining Defence properties (such as 5AVN Fire Water booster pumps site [Property 1273] and Ruediger Park [Property 0875] across Ingham Road to the south) are inferred to be on-Base.

2.2 Site Setting

A summary of the Base site setting is provided below.

Table 2 Site Identification and Setting Summary (as taken from Annual Interpretive Report 2021, AECOM 2022b)

Element	Description
Regional Climate	The regional climate of Townsville is classified as tropical; however, rainfall is typically lower than other locations on the coast of North Queensland. The wet season, from approximately October to April is associated with hot and humid conditions with periods of heavy rain. The dry season is associated with dry, warm days and cool nights from approximately May to September.
Topography, geology and hydrogeology	The Base and surrounds are generally flat and low lying and are associated with the Bohle River and Townsville Town Common wetlands systems, which are subject to flooding and tidal inundation. The Base has an elevation of between 2 and 5 metres Australian Height Datum (m AHD). The elevation decreases towards to north and north-west, reaching sea level in the Townsville Town Common and at Pallarenda and Rowes Bay beaches.

Element	Description
	<p>The general underlying geology is Quaternary-aged alluvium comprising clay, silt, sand and gravel. The surface geology is presented in the Detailed Site Investigation (DSI) Report (WSP, 2018a).</p> <p>The geology is varied across the Monitoring Area; however, in general it is described as Pleistocene, quartzose, fluvial sands and gravels deposited by the Ross/Bohle River systems, overlain by shallow marine and estuarine clays, which in turn are overlain by coastal plain sediment comprising silts, clays, and minor sands. The underlying basement of Townsville is described as Julago Volcanic, comprising rhyolite to andesitic lava tuff, volcanic breccia, agglomerate with some conglomerate, sandstone, siltstone, shale and coal seams.</p> <p>There are three rocky outcrops in the region: Many Peaks Range to the north, Mount Louisa to the south-west and Castle Hill to the east.</p> <p>Three aquifers have been identified beneath the Base (WSP, 2018a), summarised as:</p> <ol style="list-style-type: none"> 1. A shallow unconfined sand aquifer hosted in the coastal sand dunes of Cleveland Bay, Rowes Bay and Pallarenda, with a maximum depth of 6.5 metres below ground level (mbgl); overlying 2. A shallow, semi-confined aquifer comprised of interbedded clays, silts and sands forming a connected aquifer across the Base, with depths between 8 mbgl (on-Base) and 11 mbgl (within Garbutt); overlying 3. A deeper, semi-confined aquifer located in sands and gravels associated with paleo-channels at depths between 15 and 40 mbgl. <p>Inferred groundwater flow directions derived during the DSI (WSP, 2018a) and the Seasonal Monitoring Reports (WSP, 2019a; WSP, 2019b) indicated groundwater flows in a north to north-east direction across the Monitoring Area towards the Townsville Town Common and Rowes Bay. A piezometric high point extends from Garbutt across the south-east corner of the Base to Townsville Airport. Groundwater flow is partially radial around this area towards the west, north-west, north-east and east.</p>
Vegetation	<p>There is little to no remnant vegetation across the majority of the Base, airport and surrounding suburbs.</p> <p>The Town Common is classified 'Category B – Remnant vegetation' on the Regulated Vegetation Management Map, with a section at the centre of the Town Common classified as 'Essential Habitat Category A or B'. The lower reaches of the Bohle River are classified as 'Category R – Reef regrowth watercourse vegetation'.</p> <p>Portions of the Three Mile Creek and Mundy Creek wetlands are classified 'Category B – Remnant vegetation' on the Regulated Vegetation Management Map, with the banks of the lower reaches classified as 'Category R – Reef regrowth watercourse vegetation'.</p>
Surface water and drainage	<p>The Base has three main surface water catchments: the Bohle River drainage sub-basin including Bohle River/Louisa Creek/Town Common catchment, Three Mile Creek and Mundy Creek (also referred to as Captain's Creek). The monitoring network targets these catchments, both on-Base and off-Base.</p> <p>The three main drainage channels which flow into the Base are Louisa Creek, Peewee Creek and Mount St John Drain, all of which have catchments within the urbanised suburbs to the south and east. Peewee Creek is a small watercourse that flows into Louisa Creek. Louisa Creek drains to the Townsville Town Common to the north of the Base. Drainage to the west enters the Base through the Mount St John Drain, which is</p>

Element	Description
	<p>separated from Louisa Creek by an elevated ridge line. The primary flow path of the drain is north, away from the Base.</p> <p>On-Base, a network of drains primarily direct surface water towards the north-west towards the Louisa Creek flood plain, Townsville Town Common and the Bohle Estuary. Surface water from the south-east corner of the Base is directed to the east and then north into Mundy Creek catchment and ultimately Rowes Bay. The ordnance loading aprons and Runway 01/19, drain towards the northern boundary into the palustrine wetlands located adjacent to Rowes Bay Golf Club and ultimately into Three Mile Creek. The area to the north of Runway 01/19 along the eastern boundary of the base, drains east into the watercourse that runs along the northern side the Belgian Gardens Cemetery, joining Mundy Creek to the east before flowing north into Rowes Bay.</p> <p>Sections of the Base located adjacent to the runways, are subject to inundation and have pumping networks designed to prevent flooding. Surface water is pumped from sumps which discharge to the wetlands along the western, north-western and northern sides of the Base.</p>
Vegetation	<p>Grounds on Base are regularly maintained by the Estate Maintenance and Operation Support (EMOS) contractor. This includes mowing of grassed areas.</p> <p>Areas of wetland vegetation are present across the western portion of the Base. These areas are populated with protected marine plants and classed as “Nationally Important Wetlands” by the <i>Environmental Protection and Biodiversity Conservation (EPBC) Act 1999</i>. However, the environmental values cited in the EPBC Protected Matters Search Tool report (Commonwealth of Australia, 2021) are unlikely to be sustained given the historical use of the Property and the enactment of the wildlife hazard management plan which manages habitat on and surround the Base to limit the frequency and severity of bird strikes with aircraft (AECOM, 2019).</p>
Current and previous land use (including AFFF use)	<p>The Base has operated as an airfield since the late 1930s and the two runways are now shared with the Townsville Civilian Airport. The Base is subject to a large range of operational uses including but not limited to four military units, accommodation facilities, a fire station, current and former fire training grounds, fuel farms and an aircraft runway. PFAS was a component of legacy AFFF used at the Base for managing fuel fires and training Defence personnel in fire-fighting techniques, which contained containing perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA) as active ingredients.</p> <p>Defence has phased out the use of legacy AFFF to the use of Ansulite foam which does not contain PFOS and PFOA as active ingredients, although they are still present in trace amounts. Ansulite is used by Defence only in emergency situations where human life is at risk, or in controlled environments to test equipment.</p> <p>Previous environmental investigations have identified that soil, sediment, surface water and groundwater on- and off-Base have been impacted by PFAS.</p>
Land uses surrounding the Base	<p>The surrounding area comprises the residential suburbs of Pallarenda, Rowes Bay, West End and Belgian Gardens. Other land use includes various public facilities and parklands, a cemetery, and commercial/light industrial land use in the suburbs of Mount Louisa, Mount St John and Bohle. The Townsville Town Common is zoned as “Public Utilities – Townsville City Council (Reserves)” and “Special Uses – National parks” under the Townsville City Plan. Bohle River and Bohle River estuary are also extensively used for recreational fishing.</p>

2.3 Conceptual Site Model

The CSM was developed during the investigation stages (WSP, 2018a; WSP, 2019a; WSP, 2019b) and summarised in the OMP (Defence, 2019). The CSM summarises the linkages between sources, exposure pathways and receptors.

The Annual Interpretive Report (AECOM, 2022b) noted that the ongoing monitoring program monitoring over the last 12 months had provided additional data to further understand the nature and extent of PFAS concentrations in groundwater, surface water and sediment. Comparison to the available historical dataset indicates that the extent of PFAS in groundwater and surface water is similar to the extent assessed in the CSM, developed in the DSI (WSP, 2018a). Some fluctuation in the concentrations of individual PFAS compounds at individual monitoring locations is occurring, but the PFAS transport mechanisms and extent of the plume is consistent with that presented in the DSI (WSP, 2018a). The one groundwater monitoring well with PFAS concentrations orders of magnitude outside of historical range (MW021) is within a previously defined source area and as such, the exposure scenario is covered by the existing CSM.

The pathways for PFAS exposure and risks to human health and ecological receptors presented in the HHRA (WSP, 2018b), ecological risk assessment (WSP, 2019c) and PMAP (Defence, 2019) are considered to be relevant and data presented in this report does not suggest any significant changes to these mechanisms or risks.

The data presented in this report do not change the understanding of the CSM. Future monitoring will continue to contribute to an evaluation of any potential changes to the CSM understanding.

3.0 Data Quality Assessment

3.1 Data Quality Objectives

The amended NEPM, (2013) Schedule B2 Guideline on Site Characterisation (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA), (2006) *Guidance on Systematic Planning Using the Data Quality Objectives Process (EPA QA/G-4: EPA/240/B-06/001)*.

The US EPA defines the process as ‘a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect’.

The process of establishing appropriate DQOs is defined according to the following seven steps:

Table 3 The seven steps in defining DQOs

Step	Data Quality Objective Step
1	State the problem – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	Identify the goal of the study – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	Identify information inputs – Identify data and information needed to answer study questions.
4	Define the boundaries of the study – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	Develop the analytic approach – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	Specify performance or acceptance criteria – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	Develop the plan for obtaining data – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed below.

3.1.1 Step 1 – State the Problem

Defence and State agencies require up-to-date data to enable informed risk management decisions to protect human health and the environment, given that elevated concentrations of PFAS have been identified in environmental media.

Defence requires an understanding of the holistic effect of PFAS management response activities that have and will be implemented.

The data collected by this SAQP will provide a detailed dataset that can be used to assist with assessment of temporal changes in PFAS concentrations in groundwater and surface water/sediment on- and off-site. This will facilitate refinement of the CSM and associated risk, allow update of the human health and ecological risk assessment and inform management decisions by Defence and government agencies.

3.1.2 Step 2 – Identify the Goal of the Study

The overall goal of the study is to establish a systematic routine groundwater and surface water/sediment sampling and analysis program to provide current and ongoing information on the distribution and migration of PFAS contaminants of potential concern in groundwater and surface water/sediment in the Management Area and Monitoring Area.

Specific goals of the program are to:

- Understand the changes and trends in the nature, extent and magnitude of PFAS concentrations in the groundwater, surface water and sediment within the Management Area and Monitoring Area;
- Understand if the nature, extent and magnitude of PFAS concentrations have changed significantly to warrant a revision to the human health and environmental risk assessments; and
- Understand if the nature, extent and magnitude of PFAS concentrations have changed significantly to warrant refinement of any existing management measures.

The decisions to be made based on the results of the investigation are:

- Do the analytical results and field observations allow for an assessment of risk(s) associated with complete or potentially complete PFAS source-pathway-receptor pathways?
- Do the analytical results and field observations allow for the interpretation of PFAS trends and do these trends warrant a re-evaluation of management actions?
- Does the OMP need to be refined to address uncertainty and would such a change(s) result in greater efficacy with respect to ongoing management or future intervention.

3.1.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the study goal listed in Step 2 above, the following inputs will be considered:

- Physical setting of the Base;
- PFAS results from previous investigations;
- Meteorological data including rainfall;
- Field observations;
- Groundwater, sediment and surface water data collected and analysed for PFAS to assess the distribution and extent of PFAS, as part of this SAQP;
- Groundwater and surface water elevation data;
- Fate and transport mechanisms and behaviour of PFAS in the environment;
- Screening criteria (refer **Section 4.10**);
- Statistical analysis to identify trends; and
- Advances in laboratory analytical approaches and changes in regulatory requirements; and
- Recommendations made in the preceding reports completed by AECOM:
 - AECOM (2020). Sampling Event Factual Report, April 2020. PFAS OMP - RAAF Base Townsville.
 - AECOM (2021a). Sampling Event Factual Report, September 2020. PFAS OMP - RAAF Base Townsville.
 - AECOM (2021b). Rainfall Event Sampling Factual Report, December 2020. PFAS OMP – RAAF Base Townsville.
 - AECOM (2021c). Rainfall Event Sampling Factual Report, February 2021. PFAS OMP – RAAF Base Townsville.
 - AECOM (2021d). Annual Interpretive Report 2020, PFAS OMP - RAAF Base Townsville.
 - AECOM (2021e). Sampling Event Factual Report. April 2021. PFAS OMP - RAAF Base Townsville.
 - AECOM (2021f). Sampling Event Factual Report. October 2021. PFAS Ongoing Monitoring Program – RAAF Base Townsville.
 - AECOM (2022a). Rainfall Event Sampling Factual Report, January 2022. PFAS OMP – RAAF Base Townsville.

- AECOM (2022b). Annual Interpretive Report 2021. PFAS Ongoing Monitoring Program – RAAF Base Townsville.
- AECOM (2022c). Wet Season Sampling Factual Report. April 2022. PFAS OMP – RAAF Base Townsville.
- AECOM (2023a). Dry Season Sampling Factual Report, October and December 2022. PFAS OMP – RAAF Base Townsville.
- AECOM (2023b). Site Management Plan. PFAS Ongoing Monitoring Program – RAAF Townsville.

3.1.4 Step 4 – Define the Boundaries of the Study

The spatial and temporal boundaries that apply for data collection are detailed below and will influence the decision-making process for ongoing monitoring:

- The spatial boundary for data collection and decision making is the Base and the wider Monitoring Area. Refer to **Appendix A** for all sampling locations.
- The sampling completed as part of the SAQP includes groundwater, sediment and surface water, at the frequencies defined in **Section 4.3**.
- The monitoring is undertaken biannually until April 2024 (as outlined in the OMP, Department of Defence, 2019).

The SAQP will also cover the primary implementation period of the OMP (Defence, 2019). The SAQP will also cover the extent required by specific characteristics of the Base and surrounds, and behaviour of the plume, measured against specified data trends.

3.1.5 Step 5 – Develop the Analytical Approach

The decision rules can be defined as:

- Analytical selection: all samples will be analysed for the extended PFAS suite.
- Analytical method selection for PFAS is based on achieving appropriate laboratory limit of reporting (LOR) in the various media to be analysed. Standard LORs will be used for the OMP Implementation which are appropriate for meeting the adopted screening criteria.
- Sample locations have been selected with the objective of monitoring PFAS trends (temporal and seasonal), providing early warning of changes in the migration of PFAS in surface water and groundwater.
- If the laboratory quality assurance/quality control data are within the acceptable ranges, the data will be considered suitable for use.
- If PFAS concentrations are reported above the laboratory LOR, where it was previously <LOR, then it will be considered whether further assessment of the data is required.
- If the PFAS is reported at a concentration that is consistently above the adopted screening criteria, then it will be considered that further assessment is required.
- If the PFAS is reported at a concentration that is inside a trigger value or acceptable range, then it will be considered whether monitoring is continued or reduced, this assessment will be undertaken after three years of monitoring.

The decision on the acceptance of the analytical data will be made on the basis of the Data Quality Indicators (DQIs) as follows:

- **Precision:** A quantitative measure of the variability (or reproducibility) of data.
- **Accuracy:** A quantitative measure of the closeness of reported data to the “true” value.
- **Representativeness:** The confidence (expressed qualitatively) that data are representative of each media present on site.
- **Completeness:** A measure of the amount of useable data from a data collection activity.

- **Comparability:** The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.

Table 4 provides further specific details.

3.1.6 Step 6 – Specify Performance or Acceptance Criteria

Specific limits for the works included in the OMP (Defence, 2019) are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and standard procedures for field sampling and handling.

This step also examines the certainty of conclusive statements based on the available new data collected. This should include the following points to quantify tolerable limits:

- A decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative.
- A decision error in the context of the decision rule presented above would lead to either underestimation or overestimation of the risk level associated with a particular sampling area.
- Sampling errors may occur when the sampling program does not adequately detect the variability of a contaminant from point to point across the Base. To address this, the OMP outlines minimum numbers of samples proposed to be collected from each media.
- As such, there may be limitations in the data if aspects of the OMP cannot be implemented. Some examples of this scenario include but are not limited to:
 - Proposed surface water sample locations may be dry at the time of sampling.
 - Proposed groundwater well locations are damaged or destroyed and therefore cannot be sampled.
 - Proposed samples are not collected due to access being restricted to a given location.
- Measurement errors can occur during sample collection, handling, preparation, analysis and data reduction. To address this the following measures are proposed:
 - Collection of sufficient sample mass to facilitate analysis reported to standard laboratory detection limits. Collection of insufficient sample mass may result in raised detection limits.
 - Field staff to follow a standard procedure when collecting samples, including decontamination of tools, and use of appropriate sample containers and preservation methods.
 - Laboratories to follow a standard procedure when preparing samples for analysis and undertaking analysis. LOR may be increased for saline samples due to matrix interference for higher salinity samples.
 - Laboratories to report quality assurance/ quality control data for comparison with the DQIs established for the SAQP.

Table 4 provides acceptance criteria.

3.1.7 Step 7 – Optimise the Design for Obtaining Data

The methodology presented in this SAQP is designed to meet the project objectives described in Section 1.2 and to achieve the nominated DQOs. Optimisation of the data collection process will be achieved by:

- Working closely with the analytical laboratories and sampling equipment suppliers to ensure that appropriate procedures and processes are developed and implemented prior to and during the fieldwork, to ensure that sample handling, and transport to and processing by the analytical laboratories is appropriate;
- Conducting sampling according to Defence and Australian Standards for the type of sampling being conducted (i.e., groundwater monitoring well sampling versus landholder bore water sampling). These standards are as follows:

- Defence (2018 amended June 2021), DCMM.
- Standards Australia (AS/NZS5667.11–1998) *Water Quality – Sampling, part 11: Guidance on sampling of groundwater*;
- Standards Australia (AS 4482.1-2005) *Guide to the sampling and investigation of potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds*;
- Standards Australia (AS 4482.2-1999) *Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile Substances*;
- Conducting sampling in accordance with AECOM's internal PFAS Sample Collection Guidance;
- Sampling conducted by suitably qualified and experienced field staff;
- Basing the sampling upon a CSM developed using the information available at the implementation of the SAQP. Updating the CSM as new data becomes available in the course of the implementation of the SAQP, as required; and
- Progressive review of the data throughout the bi-annual OMP period and modification of sampling programs to optimise the value of data generated.

If the objectives of the SAQP are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of Data Quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

- Documentation and data completeness; and
- Data quality – comparability, representativeness, precision and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use.

The acceptance criteria for DQIs for samples are specified in **Table 4**.

Table 4 Acceptance Criteria for Data Quality Indicators for Sample Analysis

Data Quality Indicators	Acceptance Criteria
Water and Sediment Samples	
Rinsates (where sampling equipment is reused)	Less than the laboratory LOR.
Field duplicates/Inter-lab duplicates	<p>The Relative Percentage Differences (RPDs) will be assessed as acceptable if less than or equal to 30% as per the NEPM Schedule B3. Where the results show greater than 30% difference a review of the cause will be conducted (NEPM, 2013). It is noted that RPDs that exceed this range may be considered acceptable where:</p> <ul style="list-style-type: none"> • Results are less than 10 times the LOR (no limit); • Results are less than 20 times the LOR and the RPD is less than 50%; and • Heterogeneous materials are encountered.
Trip blanks and field blanks	Less than the laboratory LOR.
Laboratory duplicates	<p>RPDs less than:</p> <ul style="list-style-type: none"> • 20% for high level laboratory duplicates (i.e. >20 x LOR); and • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR).
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's QC report, based on their historical database.
Method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between laboratories specified range for each particular analyte/analytical suite.

4.0 Sampling Location Rationale and Methodology

4.1 OMP

The OMP (Defence, 2019) presents an overview of specific monitoring works to be undertaken and provides the basis for the preparation of this SAQP. This scope of works presented in this SAQP is consistent with that detailed in the OMP (Defence, 2019).

4.2 Proposed Schedule

4.2.1 Sampling Events

Groundwater, sediment and surface water sampling from across the Monitoring Area will be performed biannually until April 2024 as part of a comprehensive wet season sampling event in April and a targeted dry season sampling event in October.

The proposed schedule of fieldworks is presented in **Table 5** below. Further revision of the SAQP sampling schedule and requirements will be undertaken based on the OMP review, proposed to be completed by mid-2023.

Table 5 Proposed Fieldwork Schedule

Sampling Round No.	Description of works	Proposed Schedule
1	Wet season groundwater, sediment and surface water sampling	April 2020
2	Dry season groundwater, sediment and surface water sampling	September 2020
3	Wet season groundwater, sediment and surface water sampling	April 2021
4	Dry season groundwater, sediment and surface water sampling	October 2021
5	Wet season groundwater, sediment and surface water sampling	April 2022
6	Dry season groundwater, sediment and surface water sampling	October 2022
7	Wet season groundwater, sediment and surface water sampling	April 2023
8	Dry season groundwater, sediment and surface water sampling	October 2023
9	Wet season groundwater, sediment and surface water sampling	April 2024
As required	Rainfall event-based surface water sampling	Once per calendar year

4.3 Sample Location Rationale

4.3.1 Groundwater Sampling Locations Rationale

There are 107 groundwater monitoring wells identified for ongoing monitoring. These monitoring wells are located across the Base, Townsville City Council (TCC) controlled roadways and public spaces, and within the protected Townsville Town Common and Rowes Bay Wetlands. Permission to work in TCC roadways is managed under a Traffic Management Plan with a permit obtained from the Council for this purpose. Notification to the Department of Environment and Science (DES) is required for access to the Town Common and to obtain the key to the area from Queensland Parks and Wildlife Services. No formal permits are required for collection of environmental samples under this SAQP.

The rationale for monitoring well selection for each area is summarised in **Table 6**.

Table 6 Rationale for Groundwater Monitoring Locations

Area	Rationale
On-Base	<ul style="list-style-type: none"> • Monitor spatial and temporal variations in PFAS concentrations in groundwater concentrations up, down and cross-gradient of source areas; and • Assess if groundwater PFAS concentrations in bores down-gradient of the source areas change in response to management measures over time.
Off-Base: Townsville Town Common	<ul style="list-style-type: none"> • Monitor spatial and temporal variations in PFAS concentration in the groundwater down-gradient of the Base; • Assess if groundwater PFAS concentrations in bores to the north of the Base change in response to management measures over time; • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations; • Monitor groundwater adjacent to Louisa Creek to assess PFAS migrating from the drainage channels and Louisa Creek to groundwater; and • Monitor groundwater parallel and perpendicular to the PFAS plume to assist with understanding concentrations changes in these alignments.
Off-Base: Rowes Bay Wetlands	<ul style="list-style-type: none"> • Monitor spatial and temporal variations in PFAS concentration in the groundwater down-gradient of the Base; • Assess if groundwater PFAS concentrations in bores to the north east of the Base change in response to management measures over time; • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations; and • Monitor groundwater parallel and perpendicular to the PFAS plume to assist with understanding concentrations changes in these alignments.
Off-Base: Bohle River and Bohle Industrial Estate	<ul style="list-style-type: none"> • Monitor background variations in PFAS concentration in the groundwater up-gradient of the Base; • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations.
Off-Base: Pallarenda Residential	<ul style="list-style-type: none"> • Monitor spatial and temporal variations in PFAS concentration in the groundwater down-gradient of the Base; • Assess if groundwater PFAS concentrations in bores to the north of the Base change in response to management measures over time; • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations; and • Monitor groundwater parallel and perpendicular to the PFAS plume to assist with understanding concentrations changes in these alignments.
Off-Base: Belgian Gardens and Garbutt	<ul style="list-style-type: none"> • Monitor variations in PFAS concentration in the groundwater immediately up-gradient of the Base; • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations.

4.3.2 Groundwater Gauging Locations

Locations specified in **Table 7** are proposed to be gauged prior to each sampling event and presented in **Figure 1** in **Appendix A**.

Following the October 2022 sampling event, the groundwater monitoring wells selected for gauging were updated to allow for more representative data input to groundwater contour interpretation. Changes are outlined in **Table 8** and monitoring wells of similar depths have been selected to ensure standing water level (SWL) data is collected from the same aquifer and provide increased accuracy to groundwater contour data collected where previous monitoring wells have been removed.

Table 7 Groundwater Gauging locations

Management/Source Area	Gauging location wet/dry season
Sub-Management Area 1 – includes a Former Fire Training Area.	MW013, MW118
Sub-Management Area 2 – includes a Former Fire Training Area, Fire Station and Fuel Farm.	MW016, MW046, MW055
Sub-Management Area 3 – includes 5 th Aviation Regiment Precinct.	MW009, MW114, MW247
Northern section of Base, downgradient of Sub-Management Area 2	MW136, MW244
East and south east of Sub-Management Area 1	MW063, MW223, MW232
Balance of Base area	MW002, MW004, MW056, MW135, MW241, MW300
Townsville Town Common, north of the Base	MW205, MW206
Off-Base – Suburbs of Rowes Bay and Belgian Gardens, east of the Base	MW212, MW214, MW216, MW264
Off-Base – Suburb of Garbutt, east and south of the Base	MW217, MW218, MW221, MW225

Table 8 Changes to groundwater gauging locations

Management/Source Area	Gauging location removed	Gauging location added
Sub-Management Area 1 – includes a Former Fire Training Area.	MW116	MW013, MW118 added to replace decommissioned well.
Off-Base – Suburbs of Rowes Bay and Belgian Gardens, east of the Base		MW264 added to enable more accurate calculation of groundwater contours.

4.3.3 Groundwater Sampling Locations

The groundwater locations to be monitored as part of the wet and dry season sampling events are provided in **Table 9** and **Table 10** below and are presented in **Figure 2a** (On-Base) and **Figure 2b** (Off-Base) in **Appendix A**.

Table 9 Groundwater sampling locations- On-Base

Management/Source Area	Monitoring locations dry season	Monitoring locations - wet season	Number of locations	
			Dry	Wet
Sub-Management Area 1 – includes a Former Fire Training Area.	MW013 ² and MW118 ¹	Same as dry season	2	2
Sub-Management Area 2 – includes a Former Fire Training Area, Fire Station and Fuel Farm.	MW005 ¹ , MW015 ¹ , MW016 ¹ , MW021 ¹ , MW046 ¹ , MW054 ¹ , MW055 ¹ , MW081 ¹ , MW090 ² , MW109 ¹ , MW110 ^{1,2} , MW138 ¹ , MW139 ^{1,2} , MW246 ¹ , MW250 ² , MW251	Same as dry season	16	16
Sub-Management Area 3 – includes 5 th Aviation Regiment Precinct.	MW009 ^{1,2} , MW038 ² , MW043 ^{1,2} , MW114 ^{1,2} , MW125 ¹ , MW142 ¹ , MW247 ^{1,2} , MW248 ¹	Same as dry season	8	8
Northern section of Base, downgradient of Sub-Management Area 2	MW136, MW140 ¹ , MW243 ¹ , MW244 ¹	Same as dry season	4	4
North west of Runway 07/25	MW112 ³	Same as dry season	1	1
East and south east of Sub-Management Area 1	MW026 ¹ , MW033 ¹ , MW034 ¹ , MW061 ¹ , MW063 ¹ , MW120 ¹ , MW222, MW223, MW224, MW232	Same as dry season	10	10
South of Ingham Road – External Defence Properties (ID 0875, 1273, 1274)	MW226, MW227, MW229	Same as dry season plus MW228	3	4
Balance of Base area	MW002 ¹ , MW004 ¹ , MW056 ¹ , MW057 ¹ , MW122 ¹ , MW135 ¹ , MW234, MW241, MW242 ¹ , MW245 ¹ , MW255, MW265, MW300, MW470 ¹	Same as dry season plus MW235	14	15
Total			58	60

¹Locations conflicting with the Water Quality Monitoring Program.²Locations where data loggers are present.

Table 10 Groundwater sampling locations- Off-Base

Catchment Area	Monitoring locations dry season	Monitoring locations- wet season	Location Number	
			Dry	Wet
Off-Base – Townsville Town Common, north of the Base	MW205, MW206, MW207, MW208	Same as dry season plus MW201, MW202, MW203, MW204	4	8
Off-Base – Bohle River and Bohle Industrial Estate, west of the Base	Nil	MW231, MW237, MW238, MW239 ² , MW240, MW254 MW262	0	7
Off-Base – Suburb of Pallarenda, north east of the Base	MW233, MW252, MW253, MW301	Same as dry season	4	4
Off-Base – Suburbs of Rowes Bay and Belgian Gardens, east of the Base	MW211, MW212, MW213, MW214, MW215, MW216, MW264, MW467, MW471	Same as dry season plus MW256, MW261	9	11
Off-Base – Suburb of Garbutt, east and south of the Base	MW217, MW218, MW219, MW221, MW225, MW263, MW267 ¹	Same as dry season plus MW220 ² , MW236, MW257, MW258, MW259, MW260, MW266, MW268, MW269, MW270	7	17
Total			24	47

¹Locations conflicting with the Water Quality Monitoring Program

4.3.4 Sediment Sampling Locations Rationale

The sediment locations to be monitored as part of the wet and dry season sampling events are provided in **Table 11** and **Table 12** below and are presented in **Figure 3a** and **Figure 3b** in **Appendix A**.

4.3.5 Sediment Sampling Locations

Table 11 Sediment sampling locations- On-Base

Catchment Area	On-base Sediment Sampling Locations	Number of Locations
Mundy Creek Catchment	SD001, SD010, SD106, SD121, SD132	5
Bohle River / Louisa Creek / Townsville Town Common	SD013, SD014, SD016, SD019, SD112, SD123, SD125, SD126, SD131	9
Three Mile Creek Catchment	SD102	1
Total		15

Table 12 Sediment sampling locations- Off-Base

Catchment Area	Sediment Sampling Locations	Location Number
Mundy Creek Catchment	SD108, SD109, SD113, SD114, SD115, SD116, SD117, SD118, SD119, SD208, SD209	11
Bohle River / Louisa Creek / Townsville Town Common	SD017, SD021, SD110, SD111, SD120, SD127, SD129, SD201, SD202, SD203, SD204, SD205, SD206, SD207,	14
Three Mile Creek Catchment	SD107, SD210	2
Total		27

4.3.6 Surface Water Sampling Locations Rationale

The surface water locations to be monitored as part of the wet and dry season sampling events are provided in **Table 13** and **Table 14** below and are presented in **Figure 3a** and **Figure 3b** in **Appendix A**. These locations have been selected to maintain consistency with the recent monitoring completed within the Monitoring Area (WSP, 2019a; WSP, 2019b). Surface water locations are co-located with sediment sampling locations, and surface water will be collected where present.

Rainfall event-based sampling will be completed in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au website or 100 mm of cumulative rainfall over a 7-day period at the locations nominated in **Table 13** and **Table 14** below. Samples will be collected every day for five consecutive days. One rainfall event-based sampling round will be completed per calendar year. Rainfall event-based sampling locations are presented in **Figure 4** in **Appendix A**.

4.3.7 Surface Water Sampling Locations

Table 13 Surface water sampling locations- On-Base

Catchment Area	Surface water sampling locations	Number of Locations
Mundy Creek Catchment	SW001, SW010 ¹ , SW106, SW121 ¹ , SW132 ¹	5
Bohle River / Louisa Creek / Townsville Town Common	SW013, SW014 ¹ , SW016 ¹ , SW019, SW112 ¹ , SW123 ¹ , SW125 ¹ , SW126, SW131 ¹	9
Three Mile Creek Catchment	SW102 ¹	1
Total		15

¹Denotes location to be sampled for the Rainfall Sampling Event

Table 14 Surface water sampling locations- Off-Base

Three Mile Creek Catchment	SW107, SW210	2
Total		27

¹Denotes location to be sampled for the Rainfall Sampling Event

4.4 Sample Collection and Handling

4.4.1 Groundwater Sampling

The groundwater sampling methodology and schedule are presented in **Table 15**.

Table 15 Groundwater sampling methodology and schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured at the beginning of each sampling round, commencing with on Base wells and moving to off-Base locations and finishing with tidally influenced wells along the coastline and waterways. Groundwater wells will also be gauged immediately prior to the collection of groundwater samples.
Sample Collection Methodology	Groundwater samples will be collected from all monitoring wells using no-purge methodology HydraSleeves™ as follows <ul style="list-style-type: none"> Where a HydraSleeve™ is used for sample collection, the target interval depths should be recorded. The HydraSleeve™ should not sit at the base of a monitoring well where sediment may be present. HydraSleeve™ sampling devices are to be left in monitoring wells for a minimum of 4 hours when deployed with bottom weights only, to allow restabilisation of the well following the slight disturbance caused by sampler deployment. For HydraSleeves™ with both top and bottom weights, they are to be deployed and left in the well for a minimum of 24 hours, to allow restabilisation of the well and for the top weight to compress. Well construction details are provided in Appendix C . Once sampling is completed, new HydraSleeves™ will not be redeployed. Selected locations will have HydraSleeves™ deployed without a collar due to retrieval difficulties in the previous sampling round (MW246 and MW255). This action will be completed for all sampling rounds. A decontaminated steel bailer is to be used where insufficient water volume is available to collect samples via HydraSleeves™. Where a bailer is used, three well volumes will be removed as per Standard Operating Procedures prior to sample collection.
Field Parameters	Field parameters Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation reduction potential (ORP), pH and observations of water quality will be recorded for all samples. Field parameters are collected ex-situ post sampling using water from the HydraSleeve™. Where a bailer is used, field parameters will be recorded after removal of each well volume.
Sampling Schedule	The monitoring across the investigation area will include two monitoring events, as detailed below: Wet Season: 107 monitoring wells across the Base and surrounding areas. Dry Season: 82 monitoring wells across the Base and surrounding areas.

4.4.2 Surface Water Sampling

The surface water sampling methodology and schedule are presented in **Table 16**.

Table 16 Surface water sampling methodology and schedule

Item	Details
Sample Collection Methodology	Samples to be collected from 0.5 m below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container will be lowered into the water with the cap immediately applied once the container is full. Where the waterway cannot be accessed from the bank a telescopic sampler with a stainless steel scoop will be used to collect the sample. The sample will then immediately be transferred into the new laboratory supplied container. Where required, a boat will be used to access some locations of the Bohle River.
Field Parameters	Temperature, EC, DO, ORP, pH and observations of water quality will be recorded for all samples. Field parameters are collected ex-situ post sampling using water from the stainless steel scoop.
Sampling Schedule	Surface water sampling will be conducted at 42 locations during both the wet and dry season sampling events. Samples collected will depend on the availability of water within the waterway. The rainfall triggered sampling event will include 19 locations as denoted in Table 13 and Table 14 .

4.4.3 Sediment Sampling

The sediment sampling methodology and schedule are presented in **Table 17**.

Table 17 Sediment sampling methodology and schedule

Item	Details
Sample Collection Methodology	Samples representative of potentially deposited sediments will be collected from within the water body, if possible. Sediment samples will be collected using a gloved hand, hand trowel (where possible) or sludge and sediment sampler, as appropriate to the sample being collected. At each location, a new laboratory supplied container will be used for each sample.
Sampling Schedule	Sediment sampling will be conducted at 42 locations during both the wet and dry season sampling events.

4.4.4 Laboratory Analysis and Quality Assurance/Quality Control Sampling

The following QA/QC sampling and laboratory analysis will be conducted for all samples as outlined in **Table 18** below.

Table 18 Laboratory Analysis and QA/QC Sampling

Item	Details
QA/QC samples to be collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate, trip blank, field blank and equipment rinsate blank (rinsate) samples. Duplicate samples are to be collected at a minimum frequency of 1 in 10 primary PFAS samples. Laboratory supplied trip blanks will be included at a rate of one per batch of samples (excluding private property sampling) and will be prepared by filling sample containers with laboratory supplied PFAS free deionised water. Field blanks are to be collected at a rate of one sample per batch. Rinsate samples are to be collected at a rate of one sample per day of sampling when non-dedicated equipment is used by pouring laboratory supplied PFAS free deionised water over the decontaminated sampling equipment. Additional sample volume is required to be collected to enable the appropriate laboratory QA/QC for all water samples.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.

4.4.5 Sample Handling and Transport to Laboratory

AECOM personnel will attempt to reduce potential heterogeneity in the sample media matrix by dividing the sample collected between primary, intra- and inter-laboratory jars or bottles during sampling. All samples will be placed on ice in eskies immediately after sampling.

All samples will be kept, where possible, at or below 4°C during transit to the laboratory. Prior to sampling, assessment of the analytical holding times will be made, and the sampling planned accordingly to help ensure that holding times are not breached or are minimised as far as practicable.

Samples will be transported to the laboratory for analytical testing under standard chain of custody (CoC) documentation. Primary and associated duplicate QA/QC samples will be analysed by ALS Brisbane. The inter-laboratory duplicate samples will be analysed by Eurofins Environment Testing Australia Pty Ltd (Eurofins) in Brisbane.

4.5 Calibration

The water quality meter will be calibrated prior to the commencement of field activities in accordance with manufacturers' instructions or NATA publication "General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note No. 19 (NATA 1994)". The water quality meter will be bump tested each day prior to sampling with relevant solutions, including pH, EC, DO and ORP. Where satisfactory calibration/bump testing cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration certificates and bump test details will be recorded on field sheets and included in the Sampling Events Factual Reports.

4.6 Logistics

The laboratory sample containers will be collected from the laboratory prior to the commencement of fieldwork. All primary and intra-duplicate samples will be transported to ALS Townsville by the field team for forwarding to Brisbane. All inter-laboratory duplicate samples will be transported to Eurofins Townsville for forwarding to Brisbane under separate CoC documentation for analysis.

4.7 Analytical Suite and Laboratory Analysis Methods

4.7.1 Laboratory NATA Accreditation Details

The laboratory is required to use NATA accredited methods based on NEPM, US EPA, Table B 15 of the US Department of Defence/Department of Energy (US DOD/DoE) and American Society for Testing and Materials (ASTM) methods as appropriate.

The primary and secondary laboratories selected for this program are ALS (NATA Accreditation Number 825) and Eurofins (NATA Accreditation Number 1261), respectively.

4.7.2 Analytical Schedule

All media sampled shall be analysed for the extended PFAS suite as outlined in **Table 19** below.

Table 19 Sample Analytical Suite for PFAS

PFAS Group	Compound	CAS No.
Perfluoroalkyl Sulfonic Acids	Perfluorobutane sulfonic acid (PFBS)	375-73-5
	Perfluoropentane sulfonic acid (PFPeS)	2706-91-4
	Perfluorohexane sulfonic acid (PFHxS)	355-46-4
	Perfluoroheptane sulfonic acid (PFHpS)	375-92-8
	Perfluorooctane sulfonic acid (PFOS)	1763-23-1
	Perfluorodecane sulfonic acid (PFDS)	335-77-3
Perfluoroalkyl Carboxylic Acids	Perfluorobutanoic acid (PFBA)	375-22-4
	Perfluoropentanoic acid (PFPeA)	2706-90-3
	Perfluorohexanoic acid (PFHxA)	307-24-4
	Perfluoroheptanoic acid (PFHpA)	375-85-9
	Perfluorooctanoic acid (PFOA)	335-67-1
	Perfluorononanoic acid (PFNA)	375-95-1
	Perfluorodecanoic acid (PFDA)	335-76-2
	Perfluoroundecanoic acid (PFUnDA)	2058-94-8
	Perfluorododecanoic acid (PFDoDA)	307-55-1
	Perfluorotridecanoic acid (PFTTrDA)	72629-94-8
	Perfluorotetradecanoic acid (PFTeDA)	376-06-7
Perfluoroalkyl Sulfonamides	Perfluorooctane sulphonamide (FOSA)	754-91-6
	N-Methyl perfluorooctane sulfonamide (MeFOSA)	31506-32-8
	N-Ethyl perfluorooctane sulfonamide (EtFOSA)	4151-50-2
	N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)	2448-09-7
	N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE)	1691-99-2
	N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)	2355-31-9
	N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)	2991-50-6
(n:2) Fluorotelomer Sulfonic Acids	4:2 Fluorotelomer sulfonic acid (4:2 FTS)	757124-72-4
	6:2 Fluorotelomer sulfonic acid (6:2 FTS)	27619-97-2
	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	39108-34-4
	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	120226-60-0

The current standard laboratory limits of reporting (LOR) are described in **Table 20** below.

Table 20 Laboratory Limits of Reporting

Sample Media	Parameter	Technique/Method Reference	LOR*
Groundwater and Surface Water	Extended PFAS Suite	LC/MS-MS	0.01 – 1.0 µg/L
Sediment	Extended PFAS Suite	LC/MS-MS	0.0002 – 0.001 mg/kg

LC/MS-MS = Liquid chromatography–mass spectrometry

*LOR for Australian Laboratory Services (ALS)

4.8 Sample Nomenclature

To meet Defence data management requirements, a consistent sample nomenclature has been adopted for the Program. All primary samples will be labelled using the following Defence Contamination Management Manual (DCCM) naming convention:

PPPP_XX000_YYMMDD

[property ID]_[type of sample][THREE DIGIT sample number]_[yearmonthday]

e.g. 0874_MW001_200401

Location types and codes are prescribed by Defence and the Bases' investigation history.

Primary Sample Types/Location Codes relevant to this OMP include:

- MW = monitoring well;
- SW = surface water - no depth required;
- SD = sediment – no depth required as all sediment samples will be from surface.

QA/QC Samples will be labelled in accordance with the following convention:

- Duplicate: PPPP_QC1XX_YYMMDD;
- Triplicate: PPPP_QC2XX_YYMMDD;
- Rinsate: PPPP_QC3XX_YYMMDD;
- Trip blank: PPPP_QC4XX_YYMMDD;
- Field blank: PPPP_QC5XX_YYMMDD.

4.9 Defence ESdat Requirements

Defence has contracted Earth Science Information Systems (ESClS), to provide contamination data management services through a cloud instance of its ESdat product.

All OMP field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's ESdat database in accordance with Section 6 of DCMM Annex L (Defence, 2018, amended June 2021). AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will upload the data from each monitoring event into ESdat prior to submitting the Sampling Event Factual Report.

4.10 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this SAQP, a number of guidance documents were in circulation in Australia including:

- HEPA, (2020), PFAS NEMP 2.0.
- NEPC, (1999, as amended 2013) NEPM.
- DoH, (2019), Health Based Guidance Values for PFAS for use in site investigations in Australia.
- NHMRC, (2019), Guidance on PFAS in Recreational Water.

The adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 21** below.

Table 21 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Drinking Water	PFOS + PFHxS	0.07 µg/L	The values are from the PFAS NEMP (HEPA, 2020). Where the guideline value refers to the sum of PFOS + PFHxS, this includes PFOS only, PFHxS only and the sum of the two (HEPA, 2020). <i>All off base groundwater results will be compared to these criteria.</i>
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values are from the PFAS NEMP, (HEPA, 2020). <i>All surface water results will be compared to these criteria.</i>
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater and marine (95% species protection values)	PFOS	0.13 µg/L	The values are from the PFAS NEMP, (HEPA, 2020). <i>All surface water and groundwater results will be compared to these criteria.</i>
	PFOA	220 µg/L	

There are no current HEPA (2020) endorsed guideline values for PFAS in sediment.

4.11 Waste Management

Due to the proposed “no purge” sampling methodology, it is not anticipated that significant volumes of liquid waste would be generated that would require management or disposal.

Wastewater generated from HydraSleeve™ sampling will be returned to ground next to the well it was collected from or returned to the well if located on hardstand. If large volumes (greater than 1 L) of wastewater are generated this will be collected in a plastic drum for disposal by a licenced contractor.

No waste soil will be generated due to the proposed grab sampling approach.

All consumables (i.e., HydraSleeve™, general rubbish) will be bagged and placed in general waste bins for disposal.

4.12 Quality Assurance/Quality Control Sampling

4.12.1 Field Duplicate and Inter-laboratory Duplicate Samples

Field duplicate (intra-laboratory) samples and triplicate (inter-laboratory field duplicates) for PFAS analysis will be collected and analysed at a minimum frequency of 1 in 10 primary samples.

4.12.2 Rinsate Samples

Rinsate samples are to be collected at a rate of one sample per fieldwork day by pouring laboratory supplied deionised water over the decontaminated sampling equipment.

4.12.3 Trip Blank Samples

Trip blank samples will be supplied by the laboratory and placed in the eskies used to transport the samples at a rate of one per batch of samples delivered to the laboratory. The trip blank samples will be analysed for PFAS to assess if any contaminants have entered the sample containers during transit to the laboratory or within the container itself.

4.13 Fieldwork Documentation

4.13.1 Field Notes

Field notes will be collected electronically and maintained to record all field sampling events and include observations made at each sample location. Field notes will include information specific to the sample media as follows:

- Groundwater gauging and sampling- date and time of gauging, HydraSleeve™ installation and sampling will be recorded at each sampling location.
- Groundwater and surface water samples – comments on the observed characteristics of the sample (e.g., colour, turbidity, odour, sheen) and reported field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded.
- Surface water and sediment samples - comments on the morphology of the sample location, the depth, flow direction and strength of water flow (if water is present), the water and sediment/soil colour and odour, and the presence of flora and fauna. The soil/sediment types observed at each sample location will be described using the Unified Soil Classification System (USCS).

The coordinates for each sample location will be noted. The location of quality control (e.g., duplicate and inter-laboratory duplicate) sample collection points will also be noted.

AECOM's tablet-based data capture ('EDCA') system will be utilised by field staff to minimise potential data recording errors and allow on-the-spot identification of potentially erroneous data in comparison to historical data.

4.13.2 Sample Labels

AECOM will utilise the tablet-based ALS 'Compass' sample management application to streamline sample labelling and chain of custody (CoC) creation to ensure compliant sample IDs are used in the field.

Sample containers will also be labelled with the sample ID as a failsafe method.

A ball point pen will be used for labelling, to ensure PFAS is not introduced to the samples from permanent markers.

4.13.3 Chain of Custody Forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory. The CoC will be generated electronically using the ALS Compass app to reduce potential transcription errors.

The CoC form will include the following information:

- Job number (Note: the name of the Base is not identified for confidentiality purposes);
- Defence ESdat database reference (i.e., QLD_0874_PFASOMP);
- Date and time of sample collection;
- Sample ID;
- Type of containers;
- Name of sampler;
- Laboratory to be used;

- Analyses required;
- Any comments; and
- Signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the Field Team, (i.e., samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory for analysis.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed and the due date for the analytical results.

4.13.4 Sampling Documentation

Field sampling sheets will be completed for each location, and will include the following information (as appropriate for the media being sampled):

- Name of sampler;
- Sample location;
- Date /time of monitoring/ sampling;
- Sampling method;
- Observations of the sampled media; and
- Calibration records.

Records of all equipment calibration will be included in the Sampling Event Factual Reports. Photographs of surface water sampling locations will be taken where permitted.

4.14 Reporting

4.14.1 Sampling Event Factual Report

No later than four weeks following receipt of the laboratory reports, AECOM will prepare and submit a Sampling Event Factual Report to Defence. Each Sampling Event Factual Report will include:

- Details of the scope of monitoring completed;
- A description of the sampling methodologies used;
- A summary of observations made while sampling (e.g., recent weather conditions, any visual or olfactory observations that may indicate impacts to surface water or groundwater, or any estate management works or training activities that may have the potential to impact sampling or data);
- A summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement or decommissioning of a location;
- A presentation of the analysis results in a table that includes comparisons with PFAS guidelines, highlighting any significant statistical deviations from historical monitoring and investigation data, and identifying any locations with first-time detections of PFOS + PFHxS or POFA or new exceedances of guideline values;
- A presentation of the relative groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction;
- Discussion of the analytical data quality, including review of the quality control sampling results and laboratory quality control data; and
- Inclusion of the following information as attachments:

- Figures;
- Tables;
- Sampling logs and forms including field water quality parameter measurements;
- Chain of custody forms;
- Laboratory analytical certificates and QA/QC reports; and
- Equipment calibration certificates.

4.14.2 Annual Interpretive Report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Annual Interpretive Report to Defence. Each Interpretive Report will include:

- Evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Defence, 2019);
- Relevant figures depicting sampling locations and site-specific hydrogeological features;
- Laboratory results and analysis including comparison with relevant screening criteria as identified in the OMP (Defence, 2019);
- Assessment and commentary on appropriate QA/QC procedures;
- A review of the CSM and provision of a revised CSM if required;
- Data interpretation, including trends in groundwater concentration, gradient and flow directions;
- Assessment of statistically based trends that may inform decision making when it comes to the revision of the OMP (Defence, 2019); and
- A statement as to whether the risk profile has changed overall, or for any specific location on the Base or within the Monitoring Area, and a recommendation as to whether this should trigger an OMP and/or PMAP review, or other action.

4.15 Deviation from OMP

While the scope of works and methodology described in this SAQP are generally consistent with that presented in the OMP (Defence, 2020), deviations as a result of subsequent sampling events may occur as a result of review of recommendations made in the Sampling/Rainfall/Wet Season/Dry Season Event Reports (AECOM, 2020; AECOM 2021a, 2021b, 2021c, 2021e, 2021f and 2022a, 2022c, 2023a) and annual interpretive reports (AECOM, 2021d and 2022b) and are summarised in **Table 22** below.

Table 22 Deviations from OMP

No	Description	Rationale for deviation	Source
1	Sample from MW049, MW121, MW249	MW049, MW121, MW209, MW230 and MW249, have been removed from the SAQP as these wells are no longer serviceable and alternative replacement wells are not available.	AECOM (2020) Sampling Event Factual Report, April 2020.
2	Sample from MW230 and MW209	MW300 and MW301 replace MW230 and MW209 respectively as the old wells are no longer serviceable.	AECOM (2020) Sampling Event Factual Report, April 2020.
3	Former location codes identified in the OMP were not compliant with ESdat	The location codes have been updated in ESdat.	SAQP Revision 1 (AECOM, February 2021)
4	Sample from MW210	MW210 is to be substituted with alternative well MW471	AECOM (2021a). Sampling Event Factual Report, September 2020.
5	Inclusion of the gauging round	The OMP did not include gauging of selected wells rather all wells in the program. It is not physically possible to gauge all the wells in the program within a 24-hour period, therefore a selection of wells appropriate to producing groundwater contour maps has been identified to enable gauging of wells within one day.	SAQP Revision 7 (AECOM, September 2022)
6	Inclusion of drinking water guidelines	Drinking water guidelines were not included in the OMP Assessment of results against drinking water criteria but have been requested by Defence and therefore included in the SAQP.	SAQP Revision 7 (AECOM, September 2022)
7	Sample from MW116, MW126 and MW129	MW116, MW126 and MW129 have been removed from the SAQP as these wells are no longer serviceable and alternative replacement wells are not available.	AECOM (2023a) Dry Season Sampling Factual Report, October and December 2022.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) outlined in the PFAS Management Area Plan (PMAP) (Defence, 2019a) at the Royal Australian Airforce (RAAF) Base Townsville (the 'Base') located in the North Queensland Region. The Management Area as defined in the PMAP is the Base boundary as shown in **Figure 1** in **Appendix A**. The Monitoring Area includes areas on-Base and off-Base.

The OMP for Townsville (Defence, 2019a) includes the following sampling events:

- Biannual groundwater, surface water, and sediment sampling events in April and October 2020, 2021, and 2022; and
- Rainfall event-based sampling in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au website or 100 mm of cumulative rainfall over a 7-day period including:
 - Surface water sampling at 19 locations, daily for a period of consecutive 5 days, limited to one event per calendar year.

A sampling and analysis quality plan (SAQP, AECOM, 2020a) provides details of the sampling events. Biannual sampling events in April 2020 and September 2020 were completed and reported in AECOM (2020b) and AECOM (2020c) respectively.

A rainfall sampling event was triggered in December 2020 following 50 mm rainfall recorded at the Townsville Aero on 26 December 2020. This sampling event factual report has been prepared to report the results of the December 2020 rainfall event, specifically highlighting first-time detections and/or first-time exceedances of human health screening criteria for perfluorohexane sulfonic acid (PFHxS)+perfluorooctane sulfonate (PFOS) and / or perfluorooctanoic acid (PFOA).

This report has been prepared in accordance with the *Defence (2020) PFAS OMP factual reports – guidance for preparation*, March 2020 (Defence, 2020).

1.2 Objectives

The objectives of the OMP are to:

- Implement the OMP prepared as part of the PMAP; and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration and transport of PFAS at the Base.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

The objective of this phase of works is to implement the scope of works for the December 2020 rainfall event sampling in accordance with the SAQP (AECOM, 2020a).

2.0 Scope of Work

The sampling event at RAAF Base Townsville was completed in general accordance with the SAQP (AECOM, 2020a). In summary, the scope of works for this sampling event included:

- Review of the SAQP prior to the monitoring event to ensure compliance with the following:
 - PFAS National Environmental Management Plan (NEMP) (HEPA, 2020);
 - National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013);
 - Defence Routine Environment Water Quality Monitoring Manual (Defence, 2019b);
 - Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018); and
 - Relevant State regulatory guidelines.
- Collection of surface water samples at 19 locations including nine on-Base and ten off-Base locations, daily for five consecutive days (refer to **Figure 2**, **Appendix A** and **Table 1** below).
- Analysis of all surface water samples for the PFAS suite at the standard limit of reporting (LOR). Analysis of 20% of surface water samples for major cations (sodium, calcium, magnesium and potassium) and anions (chloride, sulphate, bicarbonate, carbonate), total suspended solids (TSS) and dissolved organic carbon (DOC).
- Collection of field duplicate and triplicate samples at a rate of 1 in 10 primary samples to be analysed for PFAS suite and 1 in 20 primary samples to be analysed for the additional analysis listed in the point above, one rinsate sample per fieldwork day, and one trip blank per sample esky.
- Data management of all OMP field and laboratory data in the Defence ESdat database.
- Preparation of this Sampling Event Factual Report.

Table 1 Surface Water Catchments and Sampling Locations

Catchment	Location ID	
	On-Base	Off-Base
Bohle River / Louisa Creek / Townsville Town Common	SW016, SW112, SW123, SW125, SW131	SW014, SW017, SW127*, SW129*
Mundy Creek	SW010, SW121*, SW132	SW108, SW109, SW115, SW116*, SW117, SW118
Three Mile Creek	SW102	

*denotes samples analysed for non-PFAS suite. As no locations were specified for non-PFAS suite in the SAQP for this sampling event locations selected for the additional analysis suite were spread across the catchments.

3.0 Methodology

3.1 Surface Water Sampling Methodology

The methodology used for the December 2020 rainfall event sampling was in accordance with the SAQP (AECOM, 2020a) and is summarised in **Table 2** below.

Table 2 Surface Water Sampling Methodology

Item	Details
Field parameters	Temperature, electrical conductance (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all surface water samples and are presented in Table T1 in Appendix B . Equipment calibration certificates for the water quality meter are provided in Appendix F . ORP readings were obtained however the ORP probe was unable to be calibrated as the calibration solutions had expired. ORP readings should be interpreted with caution.
Sampling methodology	Samples were collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory-supplied container was lowered into the water with the cap immediately applied once the container was full. Where bottles could not be lowered into the water column directly, a sampling pole with a decontaminated stainless-steel cup was used to retrieve the sample and transfer the water into the laboratory-supplied container.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. Additionally, approximately 20% of selected primary samples were submitted for major ions, TSS and DOC. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. Chain of Custody Forms are presented in Appendix D . Laboratory certificates are presented in Appendix E .
Quality Assurance/Quality Control (QA/QC) Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), trip blanks, and rinsate samples. Refer to Appendix C for assessment of QA/QC sample data.

3.2 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan (NEMP), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset include the following:

- PFAS NEMP, (HEPA 2020).
- Department of Health, 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017 [updated September 2019].
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019 (NHMRC 2019).
- *National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013* (ASC NEPM).

In accordance with the PMAP (Defence, 2019a) and SAQP (AECOM, 2020), the adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 3** below.

Table 3 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Recreational use – surface water	PFOS+PFHxS ¹	2 µg/L	The values are from NHMRC (2019).
	PFOA ²	10 µg/L	<i>All surface water results were compared to these criteria.</i>
Ecological Receptors			
Freshwater and marine (95% species protection values)	PFOS	0.13 µg/L	The values are from the PFAS NEMP 2020 (HEPA, 2020).
	PFOA	220 µg/L	<i>All surface water results were compared to these criteria.</i>

3.3 Data Quality Objectives and Data Validation

The data quality objectives and data quality indicators adopted for these works are presented in the SAQP (AECOM, 2020a).

Data validation assessment is provided in **Appendix C**.

Data validation procedures employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) (Defence, 2018 as amended 2019) Annex L requirements.

3.4 Deviation from the SAQP

Table 4 lists the deviations from the SAQP (AECOM, 2020) during this sampling round.

Table 4 Deviations from the SAQP during December 2020 Rainfall Event Sampling

SAQP	Rainfall Event Sampling December 2020	Impact of Deviation
Locations will be sampled daily for five consecutive days.	Location SW016 was unable to be sampled on one day (31/12/2020) due to safety concerns associated with flooded access roads. This location was not sampled on this date.	Concentrations of PFAS compounds at SW016 were highest on the first day of sampling. Concentrations decreased over the first three days. All samples collected at this location were above the 95% species protection guideline for freshwater and marine ecosystems. This is consistent with all but two on-Base surface water sampling locations. The collection of a surface water sample at this location on the fifth day would be unlikely to affect the interpretation of the data.
20% of primary samples will analysed for major ions, TSS and DOC.	<p>20% of primary samples were analysed for major ions, TSS, DOC, total dissolved solids (TDS) and pH, with the exception of those sampled on 31/12/2020 which were not selected for pH laboratory analysis due to an exceedance of holding time (by four days) between sampling and analysis as a result of public holidays.</p> <p>Additional analysis of samples for TDS and pH during this sampling event occurred due to the inadvertent selection of an analytical suite that included TDS and pH within the field application used to log the samples with the laboratory.</p>	Samples were analysed for additional parameters not required by the OMP. This does not impact the interpretation of the results.
Water quality meter will be calibrated daily before sampling.	<p>There is an underlying assumption in this requirement that all probes of the water quality meter will be calibrated.</p> <p>During this sampling event the ORP probe was unable to be calibrated as the calibration solutions had expired. As the timing of the event coincided with the holiday period new calibration solutions were unable to be purchased.</p>	ORP results should be interpreted with caution, however, PFAS concentrations will be unaffected by this deviation.

4.0 Field Observations and Results

The December 2020 rainfall event sampling was completed between 27 December and 31 December 2020. This sampling event was triggered by the report of 50 mm of rainfall recorded at Townsville Aero (station 032040) on 27 December 2020. **Plate 1** below shows the rainfall received at Townsville Aero the week preceding the sampling event and for the duration of the sampling.

Plate 1 Daily recorded rainfall at Townsville Aero (station 032040) 20 December to 31 December 2020

The results of the sampling event are summarised in the following sections.

4.1 Surface Water Observations and Field Measurements

Table 5 Surface Water Observations and Field Measurements

Item	Observations
Access	All surface water sampling locations were accessible and sampled for this monitoring event, with the exception of SW016 which was unable to be sampled on one day (31/12/2020) due to safety concerns associated with flooded access roads.
Field Observations	<p>Hydrocarbon sheen as the result of fuel or oil was noted at SW017 across the five-day sampling event.</p> <p>A biosheen was noted at SW014, SW108, SW115, SW117, SW121, SW123 and SW131 throughout the sampling event. No other visual or olfactory indications of contamination were observed during the sampling of the other surface water sampling locations.</p> <p>Surface water from three locations (SW010, SW116, SW118) had an organic odour and one location (SW131) had a sulfurous organic odour.</p> <p>Field observations including stream characteristics are presented in Table T1 in Appendix B.</p>

Item	Observations
Geochemical Parameters	<p>Surface water geochemical parameters were measured prior to collecting surface water samples. The readings are presented in Table T1 in Appendix B and are summarised below:</p> <ul style="list-style-type: none"> • DO ranged from 1.84 mg/L (0874_SW010_201227) to 12.9 mg/L (0874_SW131_201227) indicating a range between moderately and well oxygenated conditions. • EC ranged from 34.3 µS/cm (0874_SW123_201230) to 22,376 µS/cm (0874_SW108_201227) indicating fresh to brackish conditions. • pH ranged from 3.61 (0874_SW125_201227) to 9.39 (0874_SW108_201231). pH results generally indicated acidic to alkaline conditions. • ORP ranged from -50.4 mV (0874_SW131_201231) to 357.8 mV (0874_SW125_201227) indicating mildly to strongly oxidising conditions. • Temperature ranged from 25.6°C (0874_SW127_201231) to 36.3°C (0874_SW125_201229).
Weather Conditions	<p>Weather was generally overcast and humid during sampling. Light rain was experienced on 28/12/2020 during sampling of SW121 and SW127, and on 30/12/2020 during sampling of SW016 and SW131.</p>
Estate Management Works or Training Activities	<p>No remediation, construction or training activities were underway during the sampling event.</p>

4.1.1 PFAS Surface Water Analytical Results

Of the 94 surface water samples analysed, 81 samples reported PFAS concentrations above the laboratory LOR. The PFAS surface water analytical results from this sampling event are presented in **Table T2** in **Appendix B**. Sixty-six samples exceeded the adopted ecological guideline for PFOS and 27 samples exceeded the recreational use guideline for PFHxS + PFOS for surface water (**Table T2**, **Appendix B**).

There were no first-time detections of PFOS+PFHxS or PFOA, or first-time exceedances of guideline values in surface water samples.

4.1.2 Non-PFAS Surface Water Analytical Results

The non-PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B**.

5.0 Summary and Next Sampling Event

5.1 Summary of Rainfall Event

A surface water sampling event was triggered by the occurrence of a rainfall event on 26 December 2020 with 50 mm rainfall. The sampling event was conducted on and off-Base for RAAF Base Townsville between 27 and 31 December 2020. The event included sampling of 19 surface water locations daily for five consecutive days. **Table 6** summarises the findings of the December 2020 sampling event and the recommended actions.

Table 6 Summary of Sampling Event

Item	Comment	Recommended Actions
<u>Sediment/ Surface Water:</u> Access to sampling locations	All 19 locations were accessed daily from 27 December to 30 December. Access to location SW016 was prohibited due safety concerns associated with flooded roads on Base on 31 December. This location was not sampled on this date.	Ongoing monitoring in accordance with the OMP.
<u>Analytical Results</u>	PFAS compounds were detected above laboratory LOR in 81 of the 94 surface water samples analysed.	Ongoing monitoring in accordance with the OMP.
First-time detections and exceedances of Sum of PFOS+PFHxS, PFOS or PFOA	There were no first-time detections of PFOS+PFHxS or PFOA, or first-time exceedances of guideline values in surface water samples	No actions recommended.

5.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for April 2021.

The 2021 Rainfall Sampling Event will be performed once the appropriate rainfall trigger levels are met (refer to Section 1.1).

5.3 Upcoming Annual Interpretive Report

The next annual interpretative report is scheduled for December 2021.

* Ionic balance cannot be calculated where concentrations of individual anions or cations are below the laboratory LOR.

Appendix C

Data Validation

DATA VALIDATION REPORT

Project No.:	60612487	Validation by:	█	Date:	29/01/2021
Client:	Department of Defence				
Site:	Royal Australian Air Force (RAAF) Base Townsville				
Matrix type:	Surface water	Data verified by:	█	Date:	04/02/2021
No. of primary samples:	94 surface water				
Laboratory:	ALS (Brisbane), NMI (Sydney)	Project Manager:	█		
Lab reference:	EB2034364, EB2034405, EB2100007, RN1300060				

Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication on data interpretation and therefore decision-making on the project. The data are considered appropriate for use to meet the project objectives.
--------------------	--

Field QA/QC

Sampling personnel	Sampling was conducted by AECOM personnel between 27 and 31 December 2020.
Sampling Methodology	Samples were collected using appropriate methods as identified within the main body of the report.
Chain of Custody (COC)	COC documents completed as per AECOM procedures.
Rinsate Blank	Rinsate blank samples were collected at a frequency of at least one per day of sampling (five in total). Rinsate blanks (QC300 to QC304) were collected from the decontaminated surface water sampling cup. Concentrations were reported below the LOR for all analytes tested (see Table C2).
Trip Blanks	Trip blank samples (QC500 to QC504) were collected at a frequency of one per esky of samples submitted to ALS. Five eskies with five associated trip blanks were submitted to the Townsville laboratory. The samples were subsequently split by the laboratory into multiple eskies by the laboratory for transport to Brisbane. All trip blanks reported concentrations below the LOR, see Table C3 .
Frequency of field QC	Field duplicate (intra-laboratory duplicates) and triplicates (inter-laboratory duplicates) were collected at a frequency of one in ten primary samples for PFAS (10 duplicates and triplicates) and one in twenty primary samples for additional analytes (five duplicates and triplicates).
Handling and preservation	Primary, duplicate and triplicate samples were received preserved and chilled at the laboratory. Sample receipt temperature was reported between 0.3 and 5.9°C.
Equipment Calibration	All samples were received at the laboratory in appropriate sample containers with no sample container / preservation non-compliances noted. Calibration of the water quality meter was conducted daily before sampling. Calibration records are presented in Appendix F .

Laboratory QA/QC

Tests requested/reported	Samples were analysed and reported as requested on the COC.
Holding time compliance	Samples were extracted and analysed within recommended holding times, except: <ul style="list-style-type: none"> Total Dissolved Solids in 0874_SW116_201227, 0874_SW127_201227, 0874_SW121_201227, 0874_SW129_201227 and 0874_QC103_201227 (1 day overdue);

	<ul style="list-style-type: none"> Total Suspended Solids in 0874_SW116_201227, 0874_SW127_201227, 0874_SW121_201227, 0874_SW129_201227 and 0874_QC103_201227 (1 day overdue); Dissolved Major Cations in 0874_SW116_201227, 0874_SW127_201227, 0874_SW121_201227, 0874_SW129_201227, 0874_QC103_201227, 0874_SW116_201228, 0874_SW127_201228, 0874_SW121_201228, 0874_SW129_201228, 0874_QC104_201228, 0874_SW116_201229, 0874_SW127_201229, 0874_SW121_201229, 0874_SW129_201229, 0874_QC105_201229 (1-3 days overdue); pH in 0874_SW116_201227, 0874_SW127_201227, 0874_SW121_201227, 0874_SW129_201227, 0874_QC103_201227, 0874_SW116_201228, 0874_SW127_201228, 0874_SW121_201228, 0874_SW129_201228, 0874_QC104_201228, 0874_SW116_201229, 0874_SW127_201229, 0874_SW121_201229, 0874_SW129_201229, 0874_QC105_201229, 0874_SW116_201230, 0874_SW127_201230, 0874_SW121_201230, 0874_SW129_201230 and 0874_QC107_201230 (1-2 days overdue). <p>The holding time non-compliances are not expected to impact data quality. All PFAS analyses (the key contaminant) were analysed within the minimum holding times.</p>
Laboratory Accreditation	The laboratory analysis was conducted by ALS Environmental Pty Ltd (Brisbane) a National Association of Testing Authorities (NATA) accredited laboratory. The triplicate samples were analysed at the National Measurement Institute (Sydney), also a NATA accredited laboratory.
Frequency of laboratory QC	<p>The laboratory reported sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision, except:</p> <ul style="list-style-type: none"> Laboratory Duplicates for PFAS (5.66 - 8.33%) were below the expected rate of 10% in EB2034364, EB2034405, EB2100007. Each batch had samples analysed for PFAS. Matrix spikes for PFAS (1.89 - 3.33%) were below the expected rate of 5% in EB2034364, EB2034405, EB2100007. Each batch had samples analysed for PFAS. <p>This is not expected to impact data quality.</p>
Method Blank	Method blank concentrations were not detected above the LOR for all analytes tested.
Laboratory duplicate RPDs	Laboratory duplicate Relative Percentage Differences (RPD) were within control limits for all samples.
Laboratory control spike recovery	No non-compliances were reported for Laboratory Control Spikes (LCS).
Matrix spike recovery	<p>All matrix spike (MS) recoveries were within control limits, except:</p> <ul style="list-style-type: none"> PFOS spike recovery was not determined in 0874_SW010_201227, 0874_SW131_201228, 0874_SW121_201230 and 0874_SW118_201231 due to the background level being higher than the spike level; and PFHxS was not determined in 0874_SW131_201228, 0874_SW121_201230 due to the background level being higher than the spike level. <p>This is not expected to impact data quality or the validity of the investigation results.</p>
Surrogate spike recovery	Surrogate spike recoveries were within control limits.
QA/QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.
Data transcription	A random 10% check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.

Limits of reporting	<p>Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted screening levels.</p> <p>LOR values were adjusted due to sample matrix interference or high analyte concentrations for the following samples:</p> <ul style="list-style-type: none"> • EP231X (PFBA) in 0874_SW125_201228 (EB2034364); • EP231X in 0874_SW125_201228, 0874_SW123_201228 (EB2034364); • EP231X in 0874_SW125_201229 (EB2034405); • EP231X (PFDS) in 0874_SW123_201231 (EB2100007); and • EP231X (PFOS) in 0874_SW112_201231 (EB2100007).
Field duplicate RPDs	<p>RPDs for duplicates are reported in Table C1. Field duplicate RPDs were reported within control limits except the following (the sample with the higher concentration is in bold):</p> <ul style="list-style-type: none"> • 0874_SW125_201230 and 0874_QC108_201230 for PFBS (40%), PFHxA (40%) and PFHxS (33%). <p>The elevated RPDs for duplicate samples is potentially due to heterogeneity within the sample due to high turbidity and suspended particles as noted in Table T1 in Appendix B. These differences are not expected to impact data quality.</p>
Field triplicate RPDs	<p>Field triplicate RPDs were reported within control limits with the exception of the following (the sample with the higher concentration is in bold):</p> <ul style="list-style-type: none"> • 0874_SW116_201227 and 0874_QC203_201227 for Total Suspended Solids (87%); • 0874_SW116_201228 and 0874_QC204_201228 for Total Suspended Solids (88%); • 0874_SW127_201229 and 0874_QC205_201229 for Total Suspended Solids (75%); • 0874_SW129_201230 and 0874_QC207_201228 for Total Suspended Solids (66%); • 0874_SW125_201230 and 0874_QC208_201230 for PFBS (40%), PFHxA (53%), PFOA (67%) and PFHxS (50%); • 0874_SW121_201231 and 0874_QC209_201231 for Sulfate (76%) <p>The non-compliant RPDs for triplicate surface water samples are likely to be due to different extraction methods used by the laboratories. The minor non-compliances are not considered to affect the interpretation of the data.</p>

*RPDs have only been considered where a concentration is greater than the EQL.

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 100 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.

Accreditation No. 825
 Accredited for compliance with
 ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Accreditation Category</i>
[REDACTED]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[REDACTED]	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
[REDACTED]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- EP231X PFAS: The LOR of particular analytes have been raised due to sample matrix interferences.
- EP231X PFAS: The LOR of PFBA for sample "0874_SW125_201228" has been raised further due to sample matrix interferences.
- EP231X PFAS: Samples "0874_SW125_201228" and "0874_SW123_201228" required dilution due to sample matrix. LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

---	--

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[REDACTED]	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
[REDACTED]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Contact	: [REDACTED]	Telephone	: [REDACTED]
Project	: QLD_0874_PFASOMP	Date Samples Received	: 30-Dec-2020
Site	: QLD_0874	Issue Date	: 07-Jan-2021
Sampler	: [REDACTED]	No. of samples received	: 47
Order number	: 60612487	No. of samples analysed	: 47

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EB2034364--032	0874_SW131_201228	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP231A: Perfluoroalkyl Sulfonic Acids	EB2034364--014	0874_SW010_201227	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP231A: Perfluoroalkyl Sulfonic Acids	EB2034364--032	0874_SW131_201228	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for **VOC in soils** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✘ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Dates

Date Samples Received : 30-Dec-2020 08:55
Issue Date : 30-Dec-2020
Client Requested Due Date : 07-Jan-2021
Scheduled Reporting Date : 07-Jan-2021

Delivery Details

Mode of Delivery : Carrier
Security Seal : Intact.
No. of coolers/boxes : 7
Temperature : 0.7°C, 0.3°C, 1.4°C, 1.3°C, 2.1°C, 0.3°C, 1.3°C - Ice present
Receipt Detail : Hard Esky
No. of samples received / analysed : 47 / 47

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Proactive Holding Time Report

The following table summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory.

Matrix: **WATER**

Evaluation: ✘ = Holding time breach ; ✔ = Within holding time.

Method	Client Sample ID(s)	Container	Due for extraction	Due for analysis	Samples Received		Instructions Received	
					Date	Evaluation	Date	Evaluation
EA005-P: pH by PC Titrator

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes roles like Senior Inorganic Chemist and Senior Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LOR for PFBA, PFPeA and PFOS have been raised in several samples due to matrix interference.
- TSS by EA-025 may bias low due to fine particulate matter passing through the prescribed filter.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP231X PFAS: Sample "0874_SW125_201229" required dilution due to impacted analytes. LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFPeA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Analysis Commenced : 31-Dec-2020
Issue Date : 07-Jan-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Rows include Senior Inorganic Chemist, Senior Organic Chemist, and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: EB2034405	Page	: 1 of 13
Client	: AECOM Australia Pty Ltd	Laboratory	: Environmental Division Brisbane
Contact	: [REDACTED]	Telephone	: [REDACTED]
Project	: QLD_0874_PFASOMP	Date Samples Received	: 31-Dec-2020
Site	: QLD_0874	Issue Date	: 07-Jan-2021
Sampler	: [REDACTED]	No. of samples received	: 46
Order number	: 60612487	No. of samples analysed	: 46

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EB2034405--031	0874_SW121_201230	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP231A: Perfluoroalkyl Sulfonic Acids	EB2034405--031	0874_SW121_201230	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Outliers : Analysis Holding Time Compliance

Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	53	1.89	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✘ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Analytical Methods

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	<p>In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.</p>
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	<p>In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.</p>

Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 46 / 46

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- ***Samples were originally received by ALS TOWNSVILLE on 30/12/2020, and forwarded to ALS Brisbane for analysis.**
- **31/12/20: SRN has been resent to acknowledge the addition of analysis. For any further information regarding these adjustments please contact client services at [REDACTED]**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Proactive Holding Time Report

The following table summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory.

Matrix: **WATER**

Evaluation: ✗ = Holding time breach ; ✓ = Within holding time.

Method	Client Sample ID(s)	Container	Due for extraction	Due for analysis	Samples Received		Instructions Received	
					Date	Evaluation	Date	Evaluation
EA005-P: pH by PC Titrator

Date Analysis Commenced : 05-Jan-2021
Issue Date : 12-Jan-2021 11:20

Accreditation No. 825
 Accredited for compliance with
 ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LOR for PFDS has been raised for sample '0874_SW123_201231' due to matrix interference.
- EP231X PFAS: The LOR for PFOS has been raised for sample '0874_SW112_201231' due to matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Samples Received : 05-Jan-2021
Date Analysis Commenced : 05-Jan-2021
Issue Date : 12-Jan-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Contains 5 rows of signatory information.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EB2100007--017	0874_SW118_201231	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	2	24	8.33	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	24	4.17	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✘ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Analytical Methods							
Laboratory Duplicates (DUP)							
Alkalinity by PC Titrator	ED037-P	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Chloride by Discrete Analyser	ED045G	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of 'filterable' residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G. The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.

<i>Analytical Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- ***Samples were originally received by ALS Townsville on 04/01/21 (6.0°C), and forwarded to ALS Brisbane for analysis.**
- **For your reference: Sample '0874_SW132_201231' secondary Grey 20mL container was received empty. Please take this into consideration when reviewing your results.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

REPORT OF ANALYSIS

Page: 7 of 11
Report No. RN1300060

PFOS and PFHxS are quantified using a combined branched and linear standard, linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.^δ
Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N > 10.

Organics - NSW
Accreditation No. 198

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) outlined in the PFAS Management Area Plan (PMAP) (Defence, 2019a) at the Royal Australian Airforce (RAAF) Base Townsville (the 'Base') located in the North Queensland Region. The Management Area as defined in the PMAP is the Base boundary as shown in **Figure 1** in **Appendix A**. The Monitoring Area includes areas on-Base and off-Base.

The OMP for Townsville (Defence, 2019a) includes the following sampling events:

- Biannual groundwater, surface water, and sediment sampling events in April and October 2020, 2021, and 2022; and
- Rainfall event-based sampling in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au website or 100 mm of cumulative rainfall over a 7-day period including:
 - Surface water sampling at 19 locations, daily for a period of five consecutive days, limited to one event per calendar year.

A sampling and analysis quality plan (SAQP, AECOM, 2020) provides details of the sampling events.

A rainfall sampling event was triggered in February 2021 following 61 mm rainfall recorded at the Townsville Aero (station 032040; BOM, 2021) on 9 February 2021. This sampling event factual report has been prepared to report the results of the February 2021 rainfall event, specifically highlighting first-time detections and/or first-time exceedances of human health screening criteria for perfluorohexane sulfonic acid (PFHxS)+perfluorooctane sulfonate (PFOS) and / or perfluorooctanoic acid (PFOA).

This report has been prepared in accordance with the *Defence (2020) PFAS OMP factual reports – guidance for preparation*, March 2020 (Defence, 2020).

1.2 Objectives

The objectives of the OMP are to:

- Implement the OMP prepared as part of the PMAP; and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration and transport of PFAS at the Base.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

The objective of this phase of works is to implement the scope of works for the February 2021 rainfall event sampling in accordance with the SAQP(AECOM,2020).

2.0 Scope of Work

The sampling event at RAAF Base Townsville was completed in general accordance with the SAQP (AECOM, 2020). In summary, the scope of works for this sampling event included:

- Review of the SAQP prior to the monitoring event to ensure compliance with the following:
 - PFAS National Environmental Management Plan (NEMP) (HEPA, 2020);
 - National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013);
 - Defence Routine Environment Water Quality Monitoring Manual (Defence, 2019b);
 - Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018); and
 - Relevant State regulatory guidelines.
- Collection of surface water samples at 19 locations including nine on-Base and ten off-Base locations, daily for five consecutive days (refer to **Figure 2**, **Appendix A** and **Table 1** below).
- Analysis of all surface water samples for the PFAS suite at the standard limit of reporting (LOR).
- Analysis of 20% of surface water samples for major cations (sodium, calcium, magnesium and potassium) and anions (chloride, sulphate, bicarbonate, carbonate), total suspended solids (TSS) and dissolved organic carbon (DOC).
- Collection of field duplicate and triplicate samples at a rate of 1 in 10 primary samples to be analysed for PFAS suite and 1 in 20 primary samples to be analysed for the additional analysis listed in the point above, one rinsate sample per fieldwork day, and one trip blank per sample esky.
- Data management of all OMP field and laboratory data in the Defence ESdat database.
- Preparation of this Sampling Event Factual Report.

Table 1 Surface Water Catchments and Sampling Locations

Catchment	Location ID	
	On-Base	Off-Base
Bohle River / Louisa Creek / Townsville Town Common	SW016, SW112, SW123, SW125, SW131	SW014, SW017, SW127*, SW129*
Mundy Creek	SW010, SW121*, SW132	SW108, SW109, SW115, SW116*, SW117, SW118
Three Mile Creek	SW102	

*denotes samples analysed for non-PFAS suite. As no locations were specified for non-PFAS suite in the SAQP for this sampling event, locations selected for the additional analysis suite were spread across the catchments, targeting major flow paths both upstream and downstream of the Base.

3.0 Methodology

3.1 Surface Water Sampling Methodology

The methodology used for the February 2021 rainfall event sampling was in accordance with the SAQP (AECOM, 2020) and is summarised in **Table 2** below.

Table 2 Surface Water Sampling Methodology

Item	Details
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all surface water samples and are presented in Table T1 in Appendix B . Equipment calibration certificates for the water quality meter are provided in Appendix F .
Sampling methodology	Samples were collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory-supplied container was lowered into the water with the cap immediately applied once the container was full. Where bottles could not be lowered into the water column directly, a sampling pole with a decontaminated stainless-steel cup was used to retrieve the sample and transfer the water into the laboratory-supplied container.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. Additionally, approximately 20% of selected primary samples were submitted for major ions, TSS and DOC. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. Chain of Custody forms are presented in Appendix D . Laboratory certificates are presented in Appendix E .
Quality Assurance/Quality Control (QA/QC) Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), trip blanks, and rinsate samples. Refer to Appendix C for assessment of QA/QC sample data.

3.2 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan (NEMP), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset include the following:

- PFAS NEMP, (HEPA 2020).
- Department of Health, 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017 [updated September 2019].
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019 (NHMRC 2019).
- *National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013* (ASC NEPM).

In accordance with the PMAP (Defence, 2019a) and SAQP (AECOM, 2020), the adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 3** below.

Table 3 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Recreational use – surface water	PFOS+PFHxS	2 µg/L	The values are from NHMRC (2019).
	PFOA ²	10 µg/L	<i>All surface water results were compared to these criteria.</i>
Ecological Receptors			
Freshwater and marine (95% species protection values)	PFOS	0.13 µg/L	The values are from the PFAS NEMP 2020 (HEPA, 2020).
	PFOA	220 µg/L	<i>All surface water results were compared to these criteria.</i>

3.3 Data Quality Objectives and Data Validation

The data quality objectives and data quality indicators adopted for these works are presented in the SAQP (AECOM, 2020).

Data validation assessment is provided in **Appendix C**.

Data validation procedures employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) (Defence, 2018 as amended 2019) Annex L requirements.

3.4 Deviations from the SAQP

Table 4 lists the deviations from the SAQP (AECOM, 2020) during this sampling round.

Table 4 Deviations from the SAQP during February 2021 Rainfall Sampling Event

SAQP	February 2021 Rainfall Sampling Event	Impact of Deviation
Locations will be sampled daily for five consecutive days.	Location SW016 was unable to be sampled on the third day (11/02/2021) due to conflict with base activities. Access was not granted by air traffic control on this date and the location was not sampled.	Concentrations of PFAS compounds at SW016 were highest on the second day of sampling. All samples collected at this location were above the 95% species protection guideline for freshwater and marine ecosystems. This is consistent with all but two on-Base surface water sampling locations. It is considered that the collection of a surface water sample at this location on 11/02/2021, on the third day of the sampling program, would be unlikely to affect the interpretation of the data.

4.0 Field Observations and Results

The February 2021 rainfall event sampling was completed between 9 February and 13 February 2021. This sampling event was triggered by the report of 61.2 mm of rainfall at Townsville Aero (station 032040) on 9 February 2021. **Plate 1** below shows the daily rainfall received at Townsville Aero the week preceding the sampling event and for the duration of the sampling.

Plate 1 Daily recorded rainfall at Townsville Aero (station 032040) 2 February to 13 February 2021

The results of the sampling event are summarised in the following sections.

4.1 Surface Water Observations and Field Measurements

Table 5 Surface Water Observations and Field Measurements

Item	Observations
Access	All surface water sampling locations were accessible and sampled for this monitoring event, with the exception of SW016 which was unable to be sampled on one day (11/02/2021) due to conflict with Base activities. Access was not granted by air traffic control on this date.
Field Observations	<p>Hydrocarbon sheen as the result of fuel or oil was noted at SW017 across the five-day sampling event. This sampling location is immediately downstream of a main road and it is considered likely that this hydrocarbon sheen is related to surface water runoff from the road.</p> <p>A biosheen was noted at SW014, SW102, SW116, SW117, SW121, SW125, SW129 and SW131 on one or more days during the sampling event. No other visual indications of contamination were observed during the sampling of the other surface water sampling locations.</p> <p>Surface water from six locations (SW014, SW102, SW112, SW115, SW125 and SW127) had an organic odour, four locations (SW102, SW010, SW117 and SW131) had a sulfurous odour and one location (SW108) had a weak compost odour.</p> <p>Field observations are presented in Table T1 in Appendix B.</p>

Item	Observations
Geochemical Parameters	<p>Surface water geochemical parameters were measured prior to collecting surface water samples. The readings are presented in Table T1 in Appendix B and are summarised below:</p> <ul style="list-style-type: none"> DO ranged from 1.63 mg/L (0874_SW127_210213) to 13.93 mg/L (0874_SW132_210213) indicating a range between moderately and well oxygenated conditions. EC ranged from 88 µS/cm (0874_SW121_210211) to 49,888 µS/cm (0874_SW109_210211) indicating fresh to saline conditions. pH ranged from 6.53 (0874_SW125_210209) to 10.35 (0874_SW118_210209) pH results generally indicated near neutral to alkaline conditions. ORP ranged from -125.4 mV (0874_SW131_210210) to 199.3 mV (0874_SW117_210213) indicating moderately to strongly reducing conditions. Temperature ranged from 25.3°C (0874_SW117_210213) to 35.4°C (0874_SW132_210213).
Weather Conditions	<p>Weather was raining at times and overcast during sampling. Heavy rain was experienced on 10/02/2021 during sampling of SW117 and on 11/02/2021 during sampling of SW118. Light rain was experienced on 10/02/2021 during sampling of SW118, on 11/02/2021 during sampling of SW117, SW127 and SW129, and on 12/02/2021 during sampling of SW014, SW016, SW017, SW115, SW116, SW117 and SW118.</p> <p>The daily rainfall totals recorded by the Bureau of Meteorology at the Townsville Aero Weather Station for the sampling event were, 61.2 mm (09/02/2021), 20.8 mm (10/02/2021), 8.6 mm (11/02/2021), 13.8 mm (12/02/2021) and 5.2 mm (13/02/2021) (BOM, 2021).</p>
Estate Management Works or Training Activities	<p>No remediation, construction activities were underway during the sampling event.</p> <p>Helicopter pilot training was being undertaken at Pad West during the sampling event. This prohibited access to SW016 on 11/02/2021. Arrangements were made with air traffic control to deconflict with this training and ensure access was available in the days following.</p>

4.2 PFAS Surface Water Analytical Results

Of the 94 surface water samples analysed, 85 samples reported PFAS concentrations above the laboratory LOR. The PFAS surface water analytical results from this sampling event are presented in **Table T2** in **Appendix B**. Sixty-five samples exceeded the adopted ecological guideline for PFOS and 36 samples exceeded the recreational use guideline for PFOS+PFHxS for surface water (**Table T2, Appendix B**).

PFOA concentrations in surface water did not exceed the adopted ecological guideline or human health recreational water guidelines.

There were no first-time detections of PFOS+PFHxS, PFOS or PFOA, or first-time exceedances of guideline values in surface water samples.

4.3 Non-PFAS Surface Water Analytical Results

The non-PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B** and summarised below:

- Dissolved organic carbon ranged from 5 mg/L (0874_SW116_210210) to 24 mg/L (0874_SW121_210210)
- Total suspended solids ranged from < 5 mg/L (0874_SW121_210211 and 0874_SW127_210212) to 82 mg/L (0874_SW129_210211)
- Chloride ranged from 13 mg/L (0874_SW127_210211) and 14,100 mg/L (0874_SW116_210210)
- Sulfate ranged from 1 mg/L (0874_SW127_210211) and 2010 mg/L (0874_SW116_210210)

- Bicarbonate ranged from 11 mg/L (0874_SW127_210211) to 122 mg/L (0874_SW116_210211)
- Carbonate as CaCO₃ was below the laboratory LOR (1 mg/L) in all samples
- Calcium ranged from 3 mg/L (0874_SW127_210211) to 333 mg/L (0874_SW116_210210)
- Magnesium ranged from < 1 mg/L (0874_SW127_210211) to 1,030 mg/L (0874_SW116_210210)
- Sodium ranged from 9 mg/L (0874_SW127_210211) to 8,530 mg/L (0874_SW116_210210)
- Potassium ranged from 1 mg/L (0874_SW127_210212) to 311 mg/L (0874_SW116_210210).

5.0 Summary and Next Sampling Event

5.1 Summary of Rainfall Event

A surface water sampling event was triggered by the occurrence of 61 mm rainfall on 9 February 2021. The sampling event was conducted on and off-Base for RAAF Base Townsville between 9 and 13 February 2021. The event included sampling of 19 surface water locations daily for five consecutive days, with the exception of SW016 which was not sampled on 11 Feb 2021 as detailed below. **Table 6** summarises the findings of the February 2021 sampling event and the recommended actions.

Table 6 Summary of Sampling Event

Item	Comment	Recommended Actions
<u>Sediment/ Surface Water:</u> Access to sampling locations	All 19 locations were accessed daily from 9 February to 13 February with the exception of SW016. Access to location SW016 was prohibited by air traffic control due to conflict with Base activities on 11 February 2021. This location was not sampled on this date.	Ongoing monitoring in accordance with the OMP.
<u>Analytical Results</u>	PFAS compounds were detected above laboratory LOR in 85 of the 94 surface water samples analysed.	Ongoing monitoring in accordance with the OMP.
First-time detections and exceedances of Sum of PFOS+PFHxS, PFOS or PFOA	There were no first-time detections of PFOS+PFHxS, PFOS or PFOA, or first-time exceedances of guideline values in surface water samples	No actions recommended.

5.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for April 2021.

The 2022 Rainfall Sampling Event will be performed in 2022, once the appropriate rainfall trigger levels are met (refer to **Section 2.0**).

5.3 Upcoming Annual Interpretive Report

The next annual interpretative report is scheduled for December 2021.

* Ionic balance cannot be calculated where concentrations of individual anions or cations are below the laboratory LOR.

Appendix C

Data Validation

DATA VALIDATION REPORT

Project No.:	60612487	Validation by:	[REDACTED]	Date:	13/05/2021
Client:	Department of Defence				
Site:	Royal Australian Air Force (RAAF) Base Townsville				
Matrix type:	Surface water	Data verified by:	[REDACTED]	Date:	13/05/2021
No. of primary samples:	94 surface water				
Laboratory:	ALS (Brisbane), NMI (Sydney)	Project Manager:	[REDACTED]		
Lab reference:	EB2103614, EB2103615, EB2103815, EB2103904, EB2104017, RN1304839				

Key Issues: No QA/QC issues were identified in the field or laboratory datasets that could have a material implication on data interpretation and therefore decision-making on the project.

The data are considered appropriate for use to meet the project objectives.

Field QA/QC

Sampling personnel	Sampling was conducted by AECOM personnel between 9 and 13 February 2021.
Sampling Methodology	Samples were collected using appropriate methods as identified within the main body of the report.
Chain of Custody (COC)	COC documents completed as per AECOM procedures.
Rinsate Blank	Rinsate blank samples were collected at a frequency of at least one per day of sampling (five in total). Rinsate blanks (QC300 to QC304) were collected from the decontaminated surface water sampling cup. Concentrations were reported below the LOR for all analytes tested (see Table C2).
Trip Blanks	Trip blank samples (QC500 to QC504) were collected at a frequency of one per esky of samples submitted to ALS. Five eskies with five associated trip blanks were submitted to the Townsville laboratory. All trip blanks reported concentrations below the LOR, see Table C3 .
Frequency of field QC	Field duplicate (intra-laboratory duplicates) and triplicates (inter-laboratory duplicates) were collected at a frequency of one in 10 primary samples for PFAS (10 duplicates and triplicates) and one in 20 primary samples for additional analytes (five duplicates and triplicates).
Handling and preservation	Primary, duplicate and triplicate samples were received preserved and chilled at the laboratory. Sample receipt temperature was reported between 3.9 and 9.3°C. All samples were received at the laboratory in appropriate sample containers with no sample container / preservation non-compliances noted.
Equipment Calibration	Calibration of the water quality meter was conducted daily before sampling. Calibration records are presented in Appendix F .

Laboratory QA/QC

Tests requested/reported	Samples were analysed and reported as requested on the COC.
Holding time compliance	Samples were extracted and analysed within recommended holding times, except:

	<ul style="list-style-type: none"> Total suspended solids in 0874_SW116_210212, 0874_SW127_210212, 0874_SW121_210212, 0874_SW129_210212 and 0874_QC106_210212 (EB2103904, 3 days overdue). <p>The samples were received within the holding time however the analysis was not completed within the holding time due to the weekend. The holding time non-compliances are not expected to impact data quality. All PFAS analyses (the key contaminant) were analysed within the minimum holding times.</p>
Laboratory Accreditation	The laboratory analysis was conducted by ALS Environmental Pty Ltd (Brisbane) a National Association of Testing Authorities (NATA) accredited laboratory. The triplicate samples were analysed at the National Measurement Institute (Sydney), also a NATA accredited laboratory.
Frequency of laboratory QC	The laboratory reported sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision, except: <ul style="list-style-type: none"> Matrix spikes for PFAS were below the expected rate of 5% in EB2103614, EB2103615, EB2103815 and EB2103904. Matrix spikes for PFAS were below the expected rate of 10% in EB2104017. This is not expected to impact data quality.
Method Blank	Method blank concentrations were not detected above the LOR for all analytes tested.
Laboratory duplicate RPDs	Laboratory duplicate Relative Percentage Differences (RPD) were within control limits for all samples.
Laboratory control spike recovery	No non-compliances were reported for Laboratory Control Spikes (LCS).
Matrix spike recovery	All matrix spike (MS) recoveries were within control limits, except: <ul style="list-style-type: none"> PFBS, PFPeS, PFHxS, PFOS and PFHxA spike recovery was not determined in 0874_SW125_210210 due to the background level being greater than or equal to four times the spike level (all reported in EB2103615). Chloride spike recovery was not determined for batch EB2103815 due to the background level being greater than or equal to four times the spike level. <p>The PFAS concentrations for 0874_SW125_210210 were comparable to samples collected on the remaining dates at this location. The chloride concentrations for all samples analysed are comparable across all dates in the sampling event for each respective location. This is not expected to impact data quality or the validity of the investigation results.</p>
Surrogate spike recovery	Surrogate spike recoveries were within control limits.
QA/QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.
Data transcription	A random 10% check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted screening levels. <p>LOR values were adjusted due to sample matrix interference or high analyte concentrations for the following samples:</p> <ul style="list-style-type: none"> EP231X in 0874_SW123_210209 and 0874_SW125_210209 (EB2103614) EP231X in 0874_SW131_210210, 0874_SW125_210210 and 0874_SW123_210210 (EB2103615). EP231X (PFPeA) in 0874_SW108_210210 (EB2103615). EP231X (FOSA) in 0874_SW125_210211 (EB2103815).

- EP231X (6:2FTS and 8:2 FTS) in 0874_SW102_210211, 0874_SW108_210211, 0874_SW112_210211, 0874_SW115_210211, 0874_SW116_210211, 0874_SW118_210211, 0874_SW125_210211 and 0874_SW131_210211 (EB2103815).
- EP231X (PFDS) in 0874_SW125_210212 (EB2103904).

Where the LOR was raised, the values were sufficiently low to enable assessment against relevant screening levels and this is not expected to impact data quality or interpretation.

Field duplicate RPDs

RPDs for duplicates are reported in **Table C1**. Field duplicate RPDs were reported within control limits except the following (the sample with the higher concentration is in bold):

- 0874_SW118_210211 and **0874_QC104_210211** for PFHxA (62%) and PFOA (103%).
- 0874_SW129_210211 and **0874_QC105_210211** for 6:2FTS (64%) and 8:2 FTS (163%) and PFOS (156%).

The elevated RPDs for duplicate samples are potentially due to heterogeneity within the sample due to high turbidity and suspended particles as noted in **Table T1** in **Appendix B**. These differences are not expected to impact data quality.

0874_QC104_210211 detected concentrations of 6:2FTS and 8:2FTS which were not detected in the associated primary sample 0874_SW118_210211. This inconsistency is potentially due to heterogeneity within the sample due to high turbidity and suspended particles as noted in **Table T1** in **Appendix B**.

There are no applicable guidelines for 6:2FTS and 8:2FTS. Concentrations of PFOS and PFOS+PFHxS were above guideline limits in both the primary and duplicate samples. Given the overall consistency when comparing to the guidelines, the detection of 6:2FTS and 8:2FTS in the duplicate sample is not considered to impact on data quality. However, the detections of 6:2FTS and 8:2FTS should be noted and reviewed again following the next round of sampling.

6:2FTS, 8:2FTS and PFOS were detected in primary sample 0874_SW129_210211 and duplicate sample 0874_QC105_210211, however not detected in triplicate sample 0874_QC205_210211. Concentrations of PFOS were measured at the laboratory LOR (0.01 µg/L) in the primary sample and marginally above LOR (0.08 µg/L) in the duplicate. Non-detects in the triplicate sample are potentially due to sample heterogeneity due to high turbidity and suspended particles as noted in **Table T1** in **Appendix B**. These differences are not considered to impact on data interpretation but the detections of 6:2FTS and 8:2FTS should be noted and reviewed again in the next round of sampling. .

Field triplicate RPDs

Field triplicate RPDs were reported within control limits with the exception of the following (the sample with the higher concentration is in bold):

- Potassium in **0874_SW127_210209** and 0874_QC201_210209 (32%), **0874_SW127_210210** and 0874_QC203_210210 (50%), **0874_SW129_210211** and 0874_QC205_210211 (37%), and **0874_SW121_210212** and 0874_QC206_210212 (45%).
- **0874_SW129_210211** and 0874_QC205_210211 (31%) for chloride.
- 0874_SW129_210211 and **0874_QC205_210211** (52%) for total suspended solids.
- **0874_SW123_210213** and 0874_QC209_210213 (44%) for PFHpS.

The non-compliant RPDs for triplicate surface water samples are likely to be due to different extraction methods used by the laboratories. The minor non-compliances are not considered to affect the interpretation of the data.

TSS was detected in triplicate sample 0874_QC208_210213 and below laboratory LOR in the corresponding primary and duplicate samples. The non-detect in the primary and duplicate samples is not expected to impact data quality and is likely a result of different extraction methods used by the laboratories or minor sample heterogeneity.

*RPDs have only been considered where a concentration is greater than the EQL. Where concentration is less than LOR RPD are labelled NC for not calculated

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 100 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.

*RPDs have only been considered where a concentration is greater than the EQL. Where concentration is less than LOR RPD are labelled NC for not calculated

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 100 (1 - 10 x EQL); 50 (10 - 20 x EQL); 30 (> 20 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.

No. of coolers/boxes : 1
Receipt Detail : Medium Esky

Security Seal : Intact.
Temperature : 7.8°C - Ice present
No. of samples received / analysed : 23 / 23

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- ***Samples were originally received by ALS TOWNSVILLE on 10/2/21 (2.1°C), and forwarded to ALS Brisbane for analysis.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes roles like Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Particular samples required dilution due to sample matrix. LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Analysis Commenced : 12-Feb-2021
Issue Date : 18-Feb-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Rows include Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	23	4.35	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
---------------------	--------	--------	---------------------

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
- Sample Container(s)/Preservation Non-Compliances
- Summary of Sample(s) and Requested Analysis
- Proactive Holding Time Report
- Requested Deliverables
*Samples were originally received by ALS TOWNSVILLE on 10/2/21 (11.3°C), and forwarded to ALS Brisbane for analysis.
12/02/21: SRN has been resent to acknowledge the addition of TSS and Cation/Anion analysis to Sample #19. For any further information regarding these adjustments please contact client services at
Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
Please direct any turn around / technical queries to the laboratory contact designated above.
Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.
Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order : EB2103615
Client : AECOM Australia Pty Ltd
Contact :
Address :
BRISBANE
Telephone :
Project : QLD_0874_PFASOMP
Order number : 60612487_2.1
C-O-C number : 18785
Sampler :
Site : QLD_0874
Quote number : TV/007/21 - Compass
No. of samples received : 23
No. of samples analysed : 23

Page : 1 of 17
Laboratory : Environmental Division Brisbane
Contact :
Address :
Telephone :
Date Samples Received : 11-Feb-2021 10:20
Date Analysis Commenced : 12-Feb-2021
Issue Date : 18-Feb-2021 18:08

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- EP231X PFAS: Samples '0874_SW131_210210', '0874_SW125_210210' and '0874_SW123_210210' required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X PFAS: The LOR of PFPeA for sample "0874_SW108_210210" has been raised due to sample matrix interferences.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Analysis Commenced : 12-Feb-2021
Issue Date : 18-Feb-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Analytical Methods							
Laboratory Duplicates (DUP)							
Alkalinity by PC Titrator	ED037-P	2	17	11.76	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Chloride by Discrete Analyser	ED045G	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Dissolved Organic Carbon	EP002	2	10	20.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Fluoride by PC Titrator	EK040P	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Major Cations - Dissolved	ED093F	4	33	12.12	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	3	23	13.04	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	2	20	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
---------------------	--------	--------	---------------------

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIPT NOTIFICATION (SRN)

QC Level : NEPM 2013 B3 & ALS QC Standard

Site : QLD_0874

Sampler :

Dates

Date Samples Received : 12-Feb-2021 09:45
Client Requested Due Date : 19-Feb-2021

Issue Date : 12-Feb-2021
Scheduled Reporting Date : 19-Feb-2021

Delivery Details

Mode of Delivery : Carrier
No. of coolers/boxes : 1
Receipt Detail : MEDIUM ESKY

Security Seal : Intact.
Temperature : 3.9°C - Ice present
No. of samples received / analysed : 22 / 22

General Comments

- This report contains the following information:
- Sample Container(s)/Preservation Non-Compliances
- Summary of Sample(s) and Requested Analysis
- Proactive Holding Time Report
- Requested Deliverables
Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
Please direct any turn around / technical queries to the laboratory contact designated above.
Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.
Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- EP231X PFAS: The FOSA LOR for '0874_SW125_210211' has been raised due to matrix interference.
- EP231X PFAS: The LORs for 6:2FTS and 8:2FTS for particular samples have been raised due to matrix interference.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Analysis Commenced : 12-Feb-2021
Issue Date : 19-Feb-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes Senior Inorganic Chemist and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
---------------------	--------	--------	---------------------

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of samples received / analysed : 23 / 23

General Comments

- This report contains the following information:
- Sample Container(s)/Preservation Non-Compliances
- Summary of Sample(s) and Requested Analysis
- Proactive Holding Time Report
- Requested Deliverables
Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
EA025H, ED037-P, ED041G, ED045G, EK040P conducted by ALS Townsville, NATA accreditation no. 825, (Site no. 23472 for Chemical Testing and Site no. 23313 for Biological Testing)
Please direct any turn around / technical queries to the laboratory contact designated above.
Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
All remaining analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.
Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order : EB2103904
Client : AECOM Australia Pty Ltd
Contact :
Address :
Telephone :
Project : QLD_0874_PFASOMP
Order number : 60612487_2.1
C-O-C number : 18919
Sampler :
Site : QLD_0874
Quote number : TV/007/21 - Compass
No. of samples received : 23
No. of samples analysed : 23

Page : 1 of 16
Laboratory : Environmental Division Brisbane
Contact :
Address :
Telephone :
Date Samples Received : 12-Feb-2021 14:04
Date Analysis Commenced : 17-Feb-2021
Issue Date : 22-Feb-2021 16:15

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Includes roles like Senior Organic Chemist and Laboratory Manager.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LOR for PFDS has been raised for sample '0874_SW125_210212' due to matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Method (ED041G) Sulfate results may bias low because of filtrate Colour
- EA025H, ED037-P, ED041G, ED045G, EK040P conducted by ALS Townsville, NATA accreditation no. 825, (Site no. 23472 for Chemical Testing and Site no. 23313 for Biological Testing)
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

Date Samples Received : 12-Feb-2021
Date Analysis Commenced : 17-Feb-2021
Issue Date : 22-Feb-2021

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Rows include Senior Organic Chemist, Senior Inorganic Chemist, 2IC Organic Chemist, and Laboratory Manager.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Matrix: **WATER** Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
---------------------	--------	--------	---------------------

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of samples received / analysed : 23 / 23

General Comments

- This report contains the following information:
- Sample Container(s)/Preservation Non-Compliances
- Summary of Sample(s) and Requested Analysis
- Proactive Holding Time Report
- Requested Deliverables
Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
Please direct any turn around / technical queries to the laboratory contact designated above.
Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.
Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order : EB2104017
Client : AECOM Australia Pty Ltd
Contact :
Address :
BRISBANE
Telephone :
Project : QLD_0874_PFASOMP
Order number : 60612487_2.1
C-O-C number : 18958
Sampler :
Site : QLD_0874
Quote number : TV/007/21 - Compass
No. of samples received : 23
No. of samples analysed : 23

Page : 1 of 16
Laboratory : Environmental Division Brisbane
Contact :
Address :
Telephone :
Date Samples Received : 16-Feb-2021 09:30
Date Analysis Commenced : 18-Feb-2021
Issue Date : 23-Feb-2021 12:55

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results
Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Lists roles like Senior Organic Chemist, Senior Inorganic Chemist, Assistant Laboratory Manager, and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Date Analysis Commenced : 18-Feb-2021
Issue Date : 23-Feb-2021

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Accreditation Category. Rows include Senior Organic Chemist, Senior Inorganic Chemist, Assistant Laboratory Manager, and 2IC Organic Chemist.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60612487_2.1	No. of samples analysed	: 23

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	3	33	9.09	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: * = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER** Evaluation: ✘ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
		QC	Reaular	Actual	Expected	Evaluation	
Analytical Methods							
Laboratory Duplicates (DUP)							
Alkalinity by PC Titrator	ED037-P	2	18	11.11	10.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of 'non-filterable' residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the liberated thiocyanate forms highly-coloured ferric thiocyanate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Fluoride by PC Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Dissolved Organic Carbon	EP002	WATER	In house: Referenced to APHA 5310 B. This method is compliant with NEPM Schedule B(3). Samples are combusted at high temperature in the presence of an oxidative catalyst. The evolved carbon dioxide is quantified using an IR detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
---------------------	--------	--------	---------------------

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIVED CONDITION

Date samples received: 17-FEB-2021

Sample received in good order: Yes

NMI Quotation no. provided:

Client purchase order number: 60612487_2_1

Temperature of samples: Chilled

Comments: ALL OK

Mode of Delivery: Courier

Additional Terms and Conditions

Incomplete / unclear information about samples or required testing will delay the start of the analysis work

If you require your Purchase Order (PO) number to be included on our invoice, please provide the number during sample submission and before the completion of work to avoid unnecessary delays and/or additional processing/handling fees.

The lodgement of an order or receipt of samples for NMI services referenced in this Sample Receipt Notification constitutes an acceptance of the current version of NMI Terms and Conditions or other applicable Terms referenced in the NMI Quotation. NMI Terms and Conditions are available on the web at <https://www.industry.gov.au/client-services/testing-and-analysis-services/chemical-and-biological-analysis-services-terms-and-conditions>

REPORT OF ANALYSIS

Page: 11 of 14
Report No. RN1304839

PFOS and PFHxS are quantified using a combined branched and linear standard, linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.^δ
Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N > 10.

Organics - NSW
Accreditation No. 198

24-FEB-2021

Filename = N:\North Ryde\Data\Inorganics\Quality System\QA Reports\Water\QA_Reports_2021\APOL03\

Legend

Acceptable recovery is 80-120%.

Acceptable RPDs on duplicates is 30% at > 5 times LOR. Greater RPD may be expected at < 5 LOR.

LOR = Limit Of Reporting

ND = Not Determined

RPD = Relative Percent Difference

NA = Not Applicable

LCS = Laboratory Control Sample.

Comments

This report shall not be reproduced except in full.

Results greater than ten times LOR have been rounded to two significant figures.

Filename = N:\North Ryde\Data\Inorganics\Reporting\Water\Water 2021\CSV Upload\

Legend:

Acceptable recovery is 75-120%.

Acceptable RPDs on duplicates is 44% at concentrations >5 times LOR. Greater RPD may be expected at <5 times LOR.

LOR = Limit Of Reporting

ND = Not Determined

RPD = Relative Percent Difference

NA = Not Applicable

LCS = Laboratory Control Sample.

#: Spike level is less than 50% of the sample's concentration, hence the recovery data cannot be reported.

Comments:

Results greater than ten times LOR have been rounded to two significant figures.

This report shall not be reproduced except in full.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) outlined in the PFAS Management Area Plan (PMAP) (Defence, 2019) at the Royal Australian Airforce (RAAF) Base Townsville (the 'Base') located in the North Queensland Region. The location of the Base (also referred to as the 'Management Area', as defined in the PMAP [Defence, 2019]) and the Monitoring Area (comprised the Base, residential and commercial suburbs of Garbutt, Rowes Bay, West End, Belgian Gardens, Pallarenda, Mount St John, Mount Louisa, and Bohle and the Townsville Town Common wetlands) are shown in **Figure 1** in **Appendix A**. The OMP for Townsville (Defence, 2019) includes the following sampling events:

- Biannual groundwater, surface water, and sediment sampling events in April and October 2020, 2021, and 2022; and
- Rainfall event-based sampling in response to 50 mm of rainfall recorded at Townsville Aero on the bom.gov.au website or 100 mm of cumulative rainfall over a 7-day period including:
 - Surface water sampling at 19 locations, daily for a period of 5 days, limited to one event per calendar year.

Following each sampling event, factual reports will be prepared. Annual interpretative reports will be prepared following the completion of each 12-month sampling period. This sampling event factual report has been prepared to report the results of the post wet-season sampling event completed in April 2021, specifically highlighting first-time detections and / or first-time exceedances of human health and ecological screening criteria for perfluorooctane sulfonate (PFOS) + perfluorohexane sulfonic acid (PFHxS) and / or perfluorooctanoic acid (PFOA), where relevant.

This report has been prepared in accordance with the *PFAS OMP Factual Report Guidance*, v0.2, May 2021 (Department of Defence, 2021).

1.2 Objectives

The objectives of the OMP are to:

- Implement the OMP prepared as part of the PMAP; and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration and transport of PFAS at the Base.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

The objective of this phase of works was to implement the scope of works for the April 2021 sampling event in accordance with the sampling and analysis quality plan (SAQP) (AECOM, 2021).

2.0 Scope of Work

The sampling event at RAAF Base Townsville was completed in general accordance with the SAQP (AECOM, 2021). In summary, the scope of works for this sampling event included:

- Review of the SAQP prior to the monitoring event to ensure compliance with the following:
 - PFAS National Environmental Management Plan (NEMP) (2020);
 - National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013);
 - Defence Routine Environment Water Quality Monitoring Manual;
 - AS/NZ 5667:1998 Water Quality – Sampling;
 - Australian and New Zealand Guidelines for Fresh and Marine Water Quality; and
 - Relevant State regulatory guidelines.
- Obtaining permission to work in public spaces where some groundwater sampling locations are situated.
- Collection of groundwater samples at 110 locations including 63 on-Base locations, and 47 off-Base locations (refer to **Table 1** below, and **Figure 2** in **Appendix A**). Standing water level (SWL) was measured in all wells immediately prior to sampling. It is noted that a groundwater sample from one monitoring well could not be collected during this sampling event (refer to **Table 8** for details).
- Collection of co-located surface water and sediment samples at 42 locations including 15 on-Base and 27 off-Base locations (refer to **Table 2** and **Table 3** below, and **Figure 3** in **Appendix A**). It is noted that three surface water samples and five sediment samples could not be collected during this sampling event (refer to **Table 13** and **Table 14** for details).
- Gauging of groundwater level in 27 selected monitoring wells (refer to **Figure 4** in **Appendix A** for specific locations). It is noted that groundwater level was not collected from two monitoring wells during the gauging round (refer to **Table 8** for details).
- Collection of field duplicate and triplicate samples at a rate of 1 in 10 primary samples, one rinsate sample per fieldwork day, and one trip blank per batch of samples.
- Analysis of all samples for the PFAS suite at the standard limit of reporting (LOR).
- Data management of all OMP field and laboratory data in the Defence ESdat database.
- Preparation of this Sampling Event Factual Report.

Table 1 Groundwater Sampling Locations

Locations	Monitoring Well ID
Sub-Management Area 1 – includes a Former Fire Training Area.	MW013, MW116, MW118, MW126, MW129
Sub-Management Area 2 – includes a Former Fire Training Area, Fire Station and Fuel Farm.	MW005, MW015, MW016, MW021, MW046, MW054, MW055, MW081, MW090, MW109, MW110, MW138, MW139, MW246, MW250, MW251
Sub-Management Area 3 – includes 5 th Aviation Regiment Precinct.	MW009, MW038, MW043, MW114, MW125, MW142, MW247, MW248
Northern section of Base, downgradient of Sub-Management Area 2	MW136, MW140, MW243, MW244
North west of Runway 07/25	MW112
East and south east of Sub-Management Area 1	MW026, MW033, MW034, MW061, MW063, MW120, MW222, MW223, MW224, MW232

Locations	Monitoring Well ID
South of Ingham Road – External Defence Properties (ID 0875, 1273, 1274)	MW226, MW227, MW229, MW228
Balance of Base area	MW002, MW004, MW056, MW057, MW122, MW135, MW235, MW234, MW241, MW242, MW245, MW255, MW265, MW300, MW470
Off-Base – Townsville Town Common, north of the Base	MW201, MW202, MW203, MW204, MW205, MW206, MW207, MW208
Off-Base – Bohle River and Bohle Industrial Estate, west of the Base	MW231, MW237, MW238, MW239, MW240, MW254, MW262
Off-Base – Suburb of Pallarenda, north east of the Base	MW233, MW252, MW253, MW301
Off-Base – Suburbs of Rowes Bay and Belgian Gardens, east of the Base	MW211, MW212, MW213, MW214, MW215, MW216, MW256, MW261, MW264, MW471, MW467
Off-Base – Suburb of Garbutt, east and south of the Base	MW217, MW218, MW219, MW220, MW221, MW225, MW236, MW257, MW258, MW259, MW260, MW263, MW266, MW267, MW268, MW269, MW270

Table 2 Surface Water Sampling Locations

Locations	Location ID	
On-Base	Mundy Creek Catchment	SW001, SW010, SW106, SW121, SW132
	Bohle River / Louisa Creek / Townsville Town Common	SW013, SW014, SW016, SW019, SW112, SW123, SW125, SW126, SW131
	Three Mile Creek Catchment	SW102
Off-Base	Mundy Creek Catchment	SW108, SW109, SW113, SW114, SW115, SW116, SW117, SW118, SW119, SW208, SW209
	Bohle River / Louisa Creek / Townsville Town Common	SW017, SW021, SW110, SW111, SW120, SW127, SW129, SW201, SW202, SW203, SW204, SW205, SW206, SW207,
	Three Mile Creek Catchment	SW107, SW210

Table 3 Sediment Sampling Locations

Locations	Location ID	
On-Base	Mundy Creek Catchment	SD001, SD010, SD106, SD121, SD132
	Bohle River / Louisa Creek / Townsville Town Common	SD013, SD014, SD016, SD019, SD112, SD123, SD125, SD126, SD131
	Three Mile Creek Catchment	SD102
Off-Base	Mundy Creek Catchment	SD108, SD109, SD113, SD114, SD115, SD116, SD117, SD118, SD119, SD208, SD209
	Bohle River / Louisa Creek / Townsville Town Common	SD017, SD021, SD110, SD111, SD120, SD127, SD129, SD201, SD202, SD203, SD204, SD205, SD206, SD207
	Three Mile Creek Catchment	SD107, SD210

3.0 Methodology

The methodology used for the April 2021 sampling event was in accordance with the SAQP (AECOM, 2021) and is summarised below. Deviations from the SAQP are discussed in **Section 3.6**.

3.1 Groundwater Sampling Methodology

The groundwater sampling methodology is outlined in **Table 4** below.

Table 4 Groundwater Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater was measured at selected wells at the beginning of the groundwater sampling round (as detailed in Table T1, Appendix B) and immediately prior to the collection of groundwater samples from all wells (as detailed in Table T2, Appendix B) using an interface probe.
Field Parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation reduction potential (ORP), pH and observations of water quality were recorded for using a calibrated water quality meter. Equipment calibration certificates for the water quality meter are provided in Appendix F .
Sampling methodology	Groundwater samples were collected from all monitoring wells using no-purge methodology HydraSleeves™, which were installed within the screened interval of each well (based on a review of the well construction log) for a minimum of 24 hours prior to the sampling round (as detailed in Table T2, Appendix B). For wells without available construction details, HydraSleeves™ were installed at the bottom of the well, consistent with the screened interval for wells installed in the same aquifer. Once sampling was completed, new HydraSleeves™ were deployed at the screened interval depth in preparation for the next sampling round, with the exception of wells where tree roots could prohibit the retrieval of the HydraSleeves™ in future rounds, as detailed in Table T2, Appendix B , and those locations which conflict with other monitoring programs as detailed in the SAQP and Table 8 .
Quality Assurance/Quality Control (QA/QC) Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), rinsate samples and trip blanks. Refer to Appendix C for assessment of QA/QC sample data.
Sample Analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. ALS Environmental Pty Ltd (ALS) Brisbane, Queensland was used as the primary laboratory. The National Measurement Institute (NMI) of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses of PFAS in are certified by the National Association of Testing Authorities (NATA). Chain of Custody Forms are presented in Appendix D . Laboratory certificates are presented in Appendix E .

3.2 Surface Water Sampling Methodology

The surface water sampling methodology is outlined in **Table 5** below.

Table 5 Surface Water Sampling Methodology

Item	Details
Field Parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation reduction potential (ORP), pH and observations of water quality were recorded for using a calibrated water quality meter. Equipment calibration certificates for the water quality meter are provided in Appendix F .

Item	Details
Sampling methodology	<p>Samples were collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory-supplied container was lowered into the water with the cap immediately applied once the container was full.</p> <p>Where the waterway could not be accessed from the bank, a telescopic sampler with a decontaminated stainless-steel scoop was used to collect the sample. The sample was immediately transferred into the new laboratory supplied container. A boat was used to access locations in the lower reaches of the Bohle River.</p>
Quality Assurance/Quality Control (QA/QC) Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), rinsate samples and trip blanks. Refer to Appendix C for assessment of QA/QC sample data.
Sample Analysis	<p>All primary samples were submitted for PFAS suite using the standard levels of detection.</p> <p>ALS Environmental Pty Ltd (ALS) Brisbane, Queensland was used as the primary laboratory. The National Measurement Institute (NMI) of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses of PFAS in are certified by the National Association of Testing Authorities (NATA).</p> <p>Chain of Custody Forms are presented in Appendix D. Laboratory certificates are presented in Appendix E.</p>

3.3 Sediment Sampling Methodology

The sediment sampling methodology is outlined in **Table 6** below.

Table 6 Sediment Sampling Methodology

Item	Details
Sampling Collection Methodology	Samples representative of potentially deposited sediments were collected from within the water body (if possible) using a piston sediment sampler or with a trowel from the base of drains (where possible). Samples were collected from the surface of the sediment up to a depth of 0.1 m, where this depth was achievable. At each location, a new laboratory supplied container was used for each sample.
Logging	Sediment characteristics were recorded for each sample and are summarised in Table T6, Appendix B .
Quality Assurance/Quality Control (QA/QC) Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), and rinsate samples. Refer to Appendix C for assessment of QA/QC sample data.
Sample analysis	<p>All primary samples were submitted for PFAS suite using the standard levels of detection.</p> <p>ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses were certified by the NATA.</p> <p>Chain of custody forms are presented in Appendix D, laboratory analytical certificates are presented in Appendix E.</p>

3.4 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan (NEMP), Defence estate and environmental strategies, and Defence

PFAS-specific strategies and guidance. Guidance documents used to assess the dataset include the following:

- PFAS NEMP, (HEPA 2020).
- Department of Health (DoH), 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017 [updated September 2019].
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019.
- *National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013* (ASC NEPM).

In accordance with the OMP (Defence, 2020) and SAQP (AECOM, 2021), the adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 7** below.

Table 7 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values are from NHMRC (2019). <i>All surface water results will be compared to these criteria.</i>
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater and marine (95% species protection values)	PFOS	0.13 µg/L	The values are from the PFAS NEMP (HEPA, 2020). <i>All surface water and groundwater results will be compared to these criteria.</i>
	PFOA	220 µg/L	

There are no current HEPA (2020) endorsed human health or ecological guideline values available for PFAS in sediment.

3.5 Data Quality Objectives and Data Validation

The data quality objectives and data quality indicators adopted for these works are presented in the SAQP (AECOM, 2021).

Data validation assessment is provided in **Appendix C**.

Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) (Defence, 2018 as amended 2019) Annex L requirements (Department of Defence, 2019).

3.6 Deviations from the SAQP

Table 8 lists the deviations from the SAQP (AECOM, 2021) during this sampling round.

Table 8 Deviations from the SAQP during April 2021 Sampling Event

SAQP	Wet Season Sampling 2021
The depth to groundwater measured commencing with on-Base wells and moving to off-Base locations and finishing	The depth to groundwater was measured at both on Base and off Base wells concurrently. Off-Base tidally influenced wells along the coastline and waterways were gauged prior to other off-Base wells.

SAQP	Wet Season Sampling 2021
with tidally influenced wells along the coastline and waterways.	Tidally influenced wells were gauged within the same tide, therefore this is not considered to impact interpretation of data.
Depth to groundwater measured at 27 monitoring well locations during gauging round.	<p>Depth to groundwater was not recorded at MW237 and MW239 during the gauging round as these locations were inadvertently missed on the SAQP figure and so data from these locations were not included in inferred groundwater contours. SAQP figures will be updated prior to the next sampling round.</p> <p>Depth to groundwater recorded at the time of sampling at the Bohle industrial estate (near where MW237 and M39 are located) suggests groundwater flows towards the Townsville Town Common and Rowes Bay, which is consistent with groundwater flow direction across the Monitoring Area as determined during the gauging round, therefore this is not considered to impact interpretation of data.</p>
MW112, MW136, MW211, MW213, MW220, MW239, MW251, MW253, MW267, MW467 and MW470 were listed as non-conflicting with other sampling programs and HydraSleeves™ had been previously deployed at the end of the dry season. HydraSleeves™ were not in the well at commencement of this wet season sampling round.	HydraSleeves™ were not present upon arrival to the locations. HydraSleeves™ were deployed upon arrival and collected a minimum of 24 hours later. HydraSleeves™ were not redeployed at these locations to avoid future loss of equipment. This is not considered to impact interpretation of data. The SAQP will be updated prior to the next sampling round.
Collection of surface water at 42 co-located surface water and sediment locations.	<p>SW/SD106, SW/SD201, SW/SD209 were inaccessible during the sampling round due to flooding and unsafe access, therefore surface water and sediment samples could not be collected from these locations. Attempts were made twice to access these locations and included discussions with the contractors responsible for maintaining the area. Safe access was unable to be provided during the monitoring period.</p> <p>No sediment was present at SD119 and SD127 during the sampling round so no sediment samples could be collected from these locations.</p> <p>SW/SD106 and SW/SD209 are located on-Base and off-Base, respectively, in the Mundy Creek Catchment. Surface water flow directions, as defined in the PMAP (Defence, 2019), indicate that SW/SD209 is located downstream of SW/SD106, and SW/SD108 and SW/SD208 are located downstream of SW/SD209. Historically PFAS detections at SW106 and SW209, as presented in Table T9 in Appendix B have fluctuated between the same orders of magnitude and several orders of magnitude higher than PFAS detections at downstream SW108 and SW208. The absence of data from SW/SD106 and SW/SD209 may impact on interpretation of data and clearing access to these locations will be attempted during the next sampling round.</p> <p>SW/SD201 is the upstream sampling location of the Bohle River. Historically PFAS detections at SW/SD201 were the same order of magnitude as samples collected downstream at SW/SD129, as presented in Table T9 and Table T10 in Appendix B. The absence of data from SW/SD201 in this sampling round is unlikely to impact on interpretation of data.</p>

SAQP	Wet Season Sampling 2021
Collection of groundwater at 110 locations.	<p>MW244 was not sampled as it was unable to be located beneath pooled surface water and sediment related to construction works.</p> <p>MW002, MW122 and MW135 are located at the northern boundary of the Base, downgradient of MW244, and are sufficiently located to assess the distribution and concentration of PFAS at the Management Area boundary. The absence of data from MW244 in this sampling round is unlikely to impact on interpretation of data.</p>

4.0 Well Network Maintenance

Maintenance on wells within the RAAF Townsville PFAS OMP network was completed by AECOM between 30 October 2020 and 5 November 2020. This work involved maintenance of six existing monitoring wells and the installation of two new monitoring wells. Refer to **Appendix G** for the bore logs of MW300 and MW301, photographic log for the works completed and survey data for the wells.

Table 9 below provides a summary of the work completed.

Table 9 Summary of maintenance works completed by AECOM on the well network.

Well ID	Description of Work
MW009	New gatic collar installed.
MW112	New standpipe and monument installed, well painted yellow and two star pickets (yellow) installed.
MW118	New gatic collar installed.
MW206	New standpipe, monument and star picket (yellow) installed.
MW237	Concreted into place to prevent further damage
MW253	New standpipe installed; existing monument re-used.
MW207	New J-plug installed.
MW300	New well installed and developed to replace MW230 which has been destroyed and not found.
MW301	New well installed and developed to replace MW209 which is not serviceable.

Prior to the works listed in **Table 9**, at locations where ground disturbance was required a service locator was engaged to ensure avoidance of services for safety and property protection purposes. Following installation, the wells were developed with a steel bailer. Where new wells were installed or changes to the headworks occurred, wells were surveyed (see **Appendix G**) and the location data was updated in Defence ESdat. No ground disturbance was associated with work completed at MW207 and MW237, hence service location and survey were not required.

5.0 Field Observations and Results

The April 2021 sampling event was completed between 15 April and 28 May 2021, commencing with deployment of HydraSleeves™ and groundwater gauging as discussed in **Table 4**. The results are summarised in following sections.

Table 10 Overall Observations

Item	Observations
Weather Conditions	Weather ranged from overcast and light rain to clear, hot and humid during the sampling event. Weather conditions at the time of sampling are presented in Table T4 , Appendix B .
Estate Management Works or Training Activities	<p>PMAP remediation activities were limited to observational investigations and no active remediation was underway during the sampling program.</p> <p>During the sampling event construction works were being undertaken at Fuel Farm 2 (Sub-Management Area 2) and the health centre, located near the entry gate.</p> <p>Construction works observed during previous sampling rounds at Pad West appeared complete. A stockpile was observed adjacent to lost monitoring well MW244.</p>

5.1 Groundwater Results

5.1.1 Groundwater Observations and Field Measurements

Table 11 Groundwater Observations and Field Measurements

Item	Observations
Access	<p>All monitoring wells were accessible except for the following:</p> <ul style="list-style-type: none"> MW244 was located underneath pooled surface water and sediment related to adjacent construction works. Field staff were unable to locate the well.
Monitoring Well Network	<p>The headworks at the following monitoring wells were noted to be damaged during the April 2021 sampling event:</p> <ul style="list-style-type: none"> MW002: gatic cover was severely rusted and requires replacement. This well was able to be sampled. MW204: monument was discovered removed from standpipe and requires repairs. This well was able to be sampled. MW228: gatic bolts damaged and require replacement. This well was able to be sampled. MW240: well cap unable to seal due to build-up of hardened clay/sediment around well casing. The hardened clay/sediment should be removed to allow well cap to seal. This well was able to be sampled. MW253: well discovered with lock missing and well cap removed but present. Lock to be replaced. Well cap replaced and monitoring well was sampled but HydraSleeve™ was not redeployed due to risk of tampering. Results were consistent with historical results therefore this is unlikely to impact the interpretation of data at this location. <p>These damaged headworks are unlikely to impact the data collected or the interpretation of data during the post-wet season monitoring round, with the exception of MW253 as it is possible the HydraSleeve™ may have been tampered with.</p>

Item	Observations
Depth to Groundwater	<p>Depth to groundwater during the gauging round on 20 April 2021 was between 0.450 and 2.881 metres below top of casing. Groundwater elevations during the gauging round were between 0.731 and 4.216 metres Australian Height Datum (mAHD). Groundwater gauging data from the gauging round is presented in Table T1 in Appendix B.</p> <p>Depth to groundwater prior to sampling was between 0.052 and 7.609 metres below top of casing. Groundwater elevations prior to sampling were between 0.696 and 8.889 m AHD. Groundwater gauging data prior to sampling is presented in Table T2 in Appendix B.</p>
Groundwater Flow Direction	<p>Groundwater contours and inferred groundwater flow directions in April 2021 are shown on Figure 4 in Appendix A. In the central and western portions of the base the inferred local groundwater flow direction is to the north. In the east and northeast portion of the base, the inferred groundwater flow is towards Rowes Bay.</p> <p>It is noted that groundwater elevation data collected from the Townsville Town Common and Cape Pallarenda was likely influenced by the pooled surface waters in the Townsville Town Common at the time of gauging. For this reason, groundwater elevation data from the Townsville Town Common and Cape Pallarenda was not considered in the April 2021 inferred groundwater contours.</p>
Field Observations	<p>Groundwater from 40 monitoring well locations (MW002, MW004, MW005, MW013, MW015, MW016, MW021, MW034, MW038, MW043, MW046, MW054, MW055, MW056, MW061, MW109, MW110, MW116, MW120, MW122, MW125, MW126, MW135, MW136, MW138, MW139, MW201, MW203, MW205, MW208, MW219, MW221, MW231, MW247, MW248, MW255, MW266, MW267, MW268, MW467) had a sulfurous odour.</p> <p>Odour reported at other groundwater monitoring locations included putrefied (MW211, MW264 and MW300), and metallic (iron) (MW206). No other visible or olfactory indications of contamination were observed during the sampling of the monitoring wells.</p> <p>Field observations are presented Table T2 in Appendix B.</p>
Geophysical Parameters	<p>Groundwater geophysical parameters were measured prior to collecting groundwater samples. The readings are presented in Table T2 in Appendix B and are summarised below:</p> <ul style="list-style-type: none"> • Dissolved oxygen (DO) results ranged between 0.14 mg/L (MW203) and 24.40 mg/L (MW268). • Electrical conductivity (EC) ranged from 221.2 µS/cm (MW269) to 84,984 µS/cm (MW256) fresh to saline conditions. • pH ranged from 3.39 (MW206) to 8.19 (MW258). pH results generally indicated acidic to neutral conditions. • Oxidation-reduction potential (ORP) ranged from -192.5 mV (MW139) to 373.1 mV (MW206) indicating mildly to strongly reducing conditions. • Temperature ranged from 17.6°C (MW300) to 31.6°C (MW301).

5.1.2 Groundwater Analytical Results

Of the 109 groundwater wells sampled during this event, 99 samples reported concentrations of PFAS compounds above the laboratory LOR. The PFAS groundwater analytical results from this sampling event are presented in **Table T3** in **Appendix B**. A total of 55 samples exceeded the adopted ecological guidelines for groundwater (**Table T3, Appendix B**).

Historical groundwater results are presented in **Table T8, Appendix B**. First time detections of PFAS or exceedances of guideline values from this sampling round are presented in **Table 12** below and shown in **Figure 5, Appendix A**.

Table 12 First Time Detections of PFAS or New Exceedances of Guidelines in Groundwater

Deviation Type	Monitoring wells/bores	PFOS concentration (µg/L)		PFOA concentration (µg/L)		PFOS + PFHxS concentration (µg/L)	
		April 2021	Historical maximum	April 2021	Historical maximum	April 2021	Historical maximum
First-time detections of PFOS+PFHxS or PFOA in groundwater	MW300 ¹	NA ²		0.02	- ³	0.31	- ³
	MW301 ¹	NA ²		0.01	- ³	0.17	- ³
First time exceedance of the NEMP (HEPA, 2020) ecological guidelines ⁴ .	There were no first-time exceedances of the NEMP (HEPA, 2020) ecological guidelines.					NA ⁵	

Note: Blue shading indicates a sample with a first-time detection of PFOS+PFHxS or PFOA

¹ Locations were sampled for the first time during this sampling event. This first-time detection is the only data available for this location.

² First time detections of PFOS have not been included as per *PFAS OMP Factual Report Guidance*, v0.2, May 2021 (Department of Defence, 2021).

³ No historical data exists for the monitoring location.

⁴ Guideline values are listed detailed in Table 7.

⁵ There are no relevant ecological guideline values for PFOS+PFHxS.

Monitoring wells MW300 and MW301 were installed in October 2020 and no historical data exists at these locations, therefore the detections of PFOS+PFHxS and PFOA in April 2021 are recorded as first-time detections. MW300 and MW301 were installed to replace the damaged or destroyed monitoring wells MW230 and MW209 respectively, where detections of PFOS+PFHxS and PFOA were historically recorded as presented in **Table T8, Appendix B**. Groundwater sampling results were within the same order of magnitude as historically reported concentrations and were generally within the historical range of concentrations with the exception of MW005, MW009, MW021, MW081, MW112, MW121, MW125, MW209, MW213, MW214, MW218, MW230, MW235, MW241, MW247, MW253, MW256, MW261 and MW262.

5.2 Surface Water Results

5.2.1 Surface Water Observations and Field Measurements

Table 13 Surface Water Observations and Field Measurements

Item	Observations
Access	<p>Three surface water sampling locations SW106, SW201 and SW209 were inaccessible and unable to be sampled.</p> <ul style="list-style-type: none"> SW106 and SW209, located on-Base and off-Base respectively along an unnamed non-perennial watercourse within the Munday Creek Catchment, were unable to be accessed due to long grass blocking the access track to both locations. No other access tracks to these locations exist and AECOM were advised that Defence do not maintain this area and could not create an access track. The locations were not sampled. SW201, located off-Base along the Bohle River, was unable to be accessed due to a stockpile associated with a housing development blocking the track leading to the sampling location. Alternative access to Bohle River was considered but unable to be safely established. The location was not sampled.
Field Observations	<p>A biosheen was noted at SW014, SW016, SW102, SW107, SW110, SW111, and SW113. No other visual or olfactory indications of contamination were observed during the sampling of the other surface water sampling locations.</p> <p>Surface water from three locations had an organic odour and six locations had a sulfurous, putrefied, or brackish odour.</p> <p>Field observations are presented in Table T4 in Appendix B.</p>

Item	Observations
Geophysical Parameters	<p>Surface water geophysical parameters were measured prior to collecting surface water samples. The readings are presented in Table T4 in Appendix B and are summarised below:</p> <ul style="list-style-type: none"> • DO ranged from 0.57 mg/L (SW131) to 12.04 mg/L (SW016) indicating moderately and well oxygenated conditions. • EC ranged from 117.5 µS/cm (SW121) to 41,333 µS/cm (SW204) indicating fresh to saline conditions. • pH ranged from 6.47 (SW131) to 9.27 (SW016). pH results generally indicated neutral to alkaline conditions. • ORP ranged from -69.6 mV (SW021) to 189 mV (SW126) indicating moderately to strongly reducing conditions. • Temperature ranged from 24.0°C (SW127) and 31.8°C (SW120).

5.2.2 Surface Water Analytical Results

Of the 39 surface water samples, 37 samples reported concentrations of PFAS compounds above the laboratory LOR. The PFAS surface water analytical results from this sampling event are presented in **Table T5** in **Appendix B**. A total of 28 surface water samples exceeded the adopted ecological guidelines and 13 surface water samples exceeded the recreational use guidelines (**Table T5**, **Appendix B**).

Historical surface water results are presented in **Table T9**, **Appendix B**. There were no first-time detections of PFOS+PFHxS or PFOA, or first-time exceedances of guideline values in surface water samples from this sampling round. Surface water sampling results were within the same order of magnitude as historically reported concentrations and were generally within the historical range of concentrations with the exception of SW021, SW107, SW108, SW109, SW118, SW203, SW204, SW205, SW206, SW210.

5.3 Sediment Results

5.3.1 Sediment Observations and Field Measurements

Table 14 Sediment Observations and Field Measurements

Compound	Criteria
Access	<p>Five sediment sampling locations were inaccessible or had no sediment present and were unable to be sampled.</p> <ul style="list-style-type: none"> • SD106 and SD209, located on-Base and off-Base respectively along an unnamed non-perennial watercourse within the Munday Creek Catchment, were unable to be accessed as noted for SW106 and SW208 above. The locations were not sampled. • SD201, located off-Base along the Bohle River, was unable to be accessed as noted for SW201 above. • SD119 and SD127, located at off-Base drains in the Mundy Creek Catchment and Bohle River/Louisa Creek/Town Common Catchment respectively, did not have any sediment present to collect at the time of sampling. The locations were sampled for surface water only.
Field Observations	<p>No visible or olfactory indications of contamination were observed during the sampling of the sediment locations.</p> <p>Sediment logging data is presented in Table T6 in Appendix B.</p>

5.3.2 Sediment Analytical Results

Of the 37 sediment samples, 34 samples reported concentrations of PFAS compounds above the laboratory LOR. The PFAS sediment analytical results from this sampling event are presented in **Table T7** in **Appendix B**.

Historical sediment results are presented in **Table T10**, **Appendix B**. There were no first-time detections of PFOS+PFHxS or PFOA during this sampling event. There are no human health or ecological guideline values available for sediment. Sediment sampling results were within the same order of magnitude as historically reported concentrations and were generally within the historical range of concentrations with the exception of SD016, SD109, SD126, SD111, SD203 and SD206.

6.0 Summary and Next Sampling Event

6.1 Summary of Monitoring Event

A groundwater, surface water and sediment monitoring event were completed both within and outside of the RAAF Base Townsville between 15 April and 28 May 2021. The program included sampling of groundwater from 62 on-Base monitoring wells, 47 off-Base monitoring wells, 37 co-located surface water and sediment locations, and a further two surface water locations where sediment was not present. **Table 15** summarises the findings of the April 2021 sampling event and the recommended actions.

Table 15 Summary of Sampling Event

Item	Comment	Recommended Actions
Groundwater: Access to sampling locations and monitoring well network condition	A total of 109 out of the 110 monitoring well locations were accessible and able to be sampled. Monitoring well maintenance was required as detailed in the following rows.	No recommended actions
	MW244: located underneath pooled surface water and sediment as a result of changed topography from adjacent stockpile construction and was unable to be found. Based on groundwater contours from the April 2021 event this well is located downgradient of Sub-Management Areas 1 and 2 with boundary wells MW002, MW056 and MW135 located further downgradient. MW244 historically exceeded the ecological guideline for PFOS. This well was previously sampled in September 2020 and was reported to be filled with saturated silt.	Locate well using GPS coordinates or a ground penetrating radar (GPR). Extend well standpipe and replace gatic with a stick-up monument. Survey new TOC and update ESdat database. Develop well to remove silt prior to the next sampling event.
	MW002: gatic cover was severely rusted and unable to be closed flush to the ground. This well was sampled. This well is located in a topographical low point and would regularly be inundated by surface water in the wet season.	Replace metal gatic headworks with a plastic gatic cover to minimise rusting from inundation, maintaining the seal and preventing possible surface water infiltration.
	MW204: monument was discovered removed from standpipe. This well was sampled.	Replace monument over standpipe and re-concrete plinth into ground.
	MW228: gatic bolts damaged and require replacement. This well was able to be sampled.	Replace gatic bolts during next sampling round.
	MW240: well cap unable to seal due to build-up of hardened clay/sediment around well casing. This well was sampled.	Remove hardened clay/sediment from gatic to allow well cap to seal, preventing possible surface water infiltration.
	MW253: well discovered with lock missing and well cap removed but present. This well was able to be sampled.	Replace well cap and monument padlock during next sampling round. HydraSleeve™ to be deployed at the beginning of the next sampling round and not redeployed following sampling due risk of tampering.

Item	Comment	Recommended Actions
<u>Sediment/ Surface Water:</u> Access to sampling locations	A total of 39 of the 42 proposed sediment and surface water locations were able to be accessed. No sediment was available to be collected at SD119 and SD127.	Ongoing monitoring in accordance with the OMP.
	SW/SD106 and SW/SD209 were unable to be accessed as noted above. It is expected that the track will become accessible during the dry season.	Assess access to SW/SD106 and SW/SD209 during next sampling event. Request access track maintenance prior to next season sampling event.
	SW201 was unable to be accessed as noted above.	Assess the viability of this sampling location and consider allocating an alternative sampling location.
<u>Analytical Results</u>	PFAS compounds were detected above laboratory LOR in 99 groundwater samples. PFAS compounds were detected above laboratory LOR in 37 surface water samples. PFAS compounds were detected above laboratory LOR in 34 sediment samples.	Ongoing monitoring in accordance with the OMP.
First-time detections of PFOS+PFHxS or PFOA	Two groundwater samples reported a first-time detection (MW300 and MW301) of PFOS+PFHxS and PFOA above the laboratory LOR. MW300 and MW301 were sampled for the first time during the April 2021 sampling event.	Ongoing monitoring in accordance with the OMP.
First time exceedance of adopted screening criteria for PFOS+PFHxS, PFOS or PFOA	There were no first-time exceedances of the NEMP (HEPA, 2020) ecological 95% Species Protection for groundwater or surface water samples. There were no first-time exceedances of the NHMRC (2019) recreational use guidelines for surface water samples.	Ongoing monitoring in accordance with the OMP.

6.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for October 2021.

6.3 Upcoming Annual Interpretive Report

The next annual interpretative report is scheduled for November 2021.

NA - Well construction details are not available in ESdat for some wells
mbtoc - metres below top of casing
TOC - top of casing
mAHD - metres above Australian Height Datum
DO - Dissolved Oxygen
EC - Electrical Conductivity
Redox - Reduction Oxidation Potential
Temp - Temperature
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolt
°C - degrees Celcius
"-" denotes no data collected

DO - Dissolved Oxygen
 EC - Electrical Conductivity
 Redox - Reduction Oxidation Potential
 Temp - Temperature
 mg/L - milligrams per litre
 µS/cm - microsiemens per centimetre
 mV - millivolt
 °C - degrees Celcius
 "-" denotes no sample collected

Property ID	Location ID	Sample Date	Sample Description	Odour
On-Base				
Bohle River/Louisa Creek/Town Common Catchment				
0874	SD013	22/04/2021	Silty CLAY, medium plasticity, brown, saturated, high organic content	Decaying organic odour
0874	SD014	22/04/2021	Silty GRAVEL, coarse gravel, dark brown, saturated, low organic content	No odour
0874	SD016	22/04/2021	Silty CLAY, low plasticity, grey to brown, saturated, high organic content	Decaying organic odour
0874	SD019	22/04/2021	Silty SAND, medium grained, loose, pale brown, moist	No odour
0874	SD112	16/04/2021	Sandy Gravelly SILT, non-plastic, grey, saturated, with medium sands and fine gravels, with some clay inclusions and high organic content (leaves and roots)	No odour
0874	SD123	22/04/2021	Sandy CLAY, low plasticity, orange to brown, moist, medium grained sands, with a trace of coarse gravel, medium organic content	No odour
0874	SD125	22/04/2021	Gravelly CLAY, low plasticity, grey to brown, saturated, fine to coarse gravels, low organic content	No odour
0874	SD126	22/04/2021	Gravelly SILT, non-plastic, dark brown, saturated, fine gravels, high organic content	Organic odour
0874	SD131	16/04/2021	Silty CLAY, low plasticity, dark grey, saturated, with high organic content (leaves and roots)	Slight sulfur odour
Mundy Creek Catchment				
0874	SD001	22/04/2021	Silty GRAVEL, medium gravel, very loose, brown, saturated	No odour
0874	SD010	22/04/2021	Sandy CLAY, high plasticity, orange to brown, saturated, with a trace of medium gravels and some organic content	Organic odour
0874	SD106	-	Unable to access	
0874	SD121	22/04/2021	Clayey SILT, non-plastic, dark brown, saturated, high organic content	Organic odour
0874	SD132	22/04/2021	GRAVEL, fine to medium sub rounded to sub angular gravel, very loose, brown, saturated	No odour
Three Mile Creek Catchment				
0874	SD102	22/04/2021	Gravelly CLAY, low plasticity, grey to brown, saturated, fine gravels, low organic content	No odour
Off-Base				
Bohle River/Louisa Creek/Town Common Catchment				
0874	SD017	15/04/2021	Silty SAND, coarse grained, black, saturated, high organic content (roots)	No odour
0874	SD021	15/04/2021	Clayey SAND, coarse grained, dark grey, saturated, with organic matter (roots)	No odour
0874	SD110	20/04/2021	Silty CLAY, medium plasticity, black, moist, soft, high organic content	No odour
0874	SD111	20/04/2021	Silty CLAY, medium plasticity, black, moist, soft, high organic content	No odour
0874	SD120	15/04/2021	Sandy CLAY, low plasticity, black and brown, saturated, coarse subangular sands and some organics (roots)	No odour
0874	SD127	-	No sediment present, no sample collected.	-
0874	SD129	20/04/2021	Clayey SAND, fine grained, grey with red to orange mottles, loose, saturated, with a trace of silt	No odour
0874	SD201	-	Unable to access	
0874	SD202	15/04/2021	Clayey SILT, low plasticity, grey, saturated, with trace of fine grained sands	No odour
0874	SD203	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with organic inclusions	No odour
0874	SD204	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with shells	No odour
0874	SD205	15/04/2021	Sandy CLAY, low plasticity, grey with orange inclusions, saturated, coarse grained sands, with silt	No odour
0874	SD206	15/04/2021	Silty CLAY, low plasticity, grey, saturated, with organic inclusions	No odour
0874	SD207	15/04/2021	Sandy CLAY, medium plasticity, brown, saturated, with some fine angular gravels	No odour
Mundy Creek Catchment				
0874	SD108	20/04/2021	Silty SAND, fine grained, grey to black, moist, loose, high organic content	Organic odour
0874	SD109	20/04/2021	Silty SAND, fine grained, grey to brown, moist, loose, some broken shells and some medium to coarse subangular gravels	No odour
0874	SD113	6/05/2021	Silty CLAY, dark grey, saturated, with some organic content	Distinct sulfur odour
0874	SD114	22/04/2021	Sandy CLAY, high plasticity, soft, red, orange and brown mottles, saturated	No odour
0874	SD115	16/04/2021	Silty CLAY, low plasticity, black, saturated, with some medium grained sands, some organic content (leaves)	No odour
0874	SD116	20/04/2021	CLAY, high plasticity, brown with black mottles, saturated, firm, some coarse sands and coarse angular gravels, with a trace of organic content	Organic odour
0874	SD117	16/04/2021	Silty Gravelly CLAY, low plasticity, black, saturated, fine to medium sub angular gravels, high organic content (leaves and sticks)	Distinct sulfur odour
0874	SD118	16/04/2021	Sandy CLAY, low plasticity, black to grey, saturated, coarse sands, with fine layer of silt at surface, high organic content (leaves and sticks)	Decaying organic odour
0874	SD119	-	No sediment present, no sample collected.	-
0874	SD208	20/04/2021	CLAY, medium to high plasticity, black with red to orange mottles, moist, soft, with a trace of coarse angular sands and some organic content	Organic odour
0874	SD209	-	Unable to access	
Three Mile Creek Catchment				
0874	SD107	20/04/2021	SILT, non-plastic, black, moist, soft, high organic and decomposing organic content	Organic odour
0874	SD210	16/04/2021	Sandy Clayey SILT, non-plastic, dark grey, saturated, fine sands, with some organic content (leaves and roots)	No odour

"-" denotes no sample taken

Analytical Data Validation

DATA VALIDATION REPORT

Project No.:	60612487	Validation by:	[REDACTED]	Date:	08/06/2021
Client:	Department of Defence				
Site:	Royal Australian Air Force (RAAF) Base Townsville				
Matrix type:	Groundwater, surface water, sediment	Data verified by:	[REDACTED]	Date:	10/06/2021
No. of primary samples:	109 groundwater, 39 surface water, 37 sediment				
Laboratory:	ALS (Brisbane), NMI (Sydney)	Project Manager:	[REDACTED]		
Lab reference:	EB2110367, EB2110866, EB2111376, EB2111812, EB2111836, EB2112383, EB2114819, RN1313030, RN1314379, RN1314922				

Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication on data interpretation and therefore decision-making on the project. The data are considered appropriate for use to meet the project objectives.
--------------------	--

Field QA/QC	
Sampling personnel	Sampling was conducted by AECOM personnel between 15 April and 28 May 2021.
Sampling Methodology	Samples were collected using appropriate methods as identified within the main body of the report.
Chain of Custody (COC)	COC documents completed as per AECOM procedures.
Rinsate Blank	<p>Rinsate blank samples were collected at a frequency of at least one per day of sampling (eleven in total). Rinsates were collected from the decontaminated interface probe and the surface water collection cup. Concentrations were reported below the LOR for all analytes tested (see Table C4) except for detections in two rinsates: 0874_QC307_210429 and 0874_QC309_210430.</p> <p>The rinsate detections are likely due to incomplete decontamination of the interface probe. Samples collected on 29/04/2021 and 30/04/2021 were assess in light of the potential for cross contamination. The concentrations reported in the samples collected on this date are not consistent with cross contamination between sampling locations, rather they appear to be more consistent with fluctuations of PFAS concentrations in source areas. The concentrations reported are orders of magnitude above the detects identified in the rinsate.</p>
