Executive Summary

Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the Ongoing Monitoring Plan (OMP) (Defence, 2019a) for monitoring of select per- and poly-fluoroalkyl substances (PFAS) at Royal Australian Air Force (RAAF) Base Richmond (the 'Site').

This Ongoing Monitoring Interpretive Report summarises the results of the monitoring undertaken between December 2020 and June 2023. Scheduled sampling events were completed in May 2021, November 2021, May 2022, November 2022 and May 2023).

This report provides interpretation of changes in concentrations and distribution of PFAS that may have occurred during the reporting period, or in comparison to previous reporting periods.

Objective

The overarching objective of implementing the OMP is to provide information on changes in the location and concentrations of PFAS within on-Site and off-Site management areas, herein collectively referred to as the Management Area (refer to **Figure 1** and **Figure 2** in **Appendix A**). The data is required to assist risk management decisions by Defence and State Government agencies to protect human health and the environment.

Monitoring Scope

AECOM completed periodic monitoring of groundwater, surface water and sediment between December 2020 and June 2023 in accordance with the Sampling and Analysis Quality Plan (SAQP) developed by AECOM (2023d). This monitoring targeted PFAS, namely perfluorooctanesulfonic acid (PFOS), perfluorooctanoic acid (PFOA) and perfluorohexanesulfonic acid (PFHxS) and included selected locations in the Management Area.

Interpretive Assessment

Data collected during the monitoring period were compared to historical data for the included sampling locations and the following was observed:

- PFAS concentrations were generally lower at off-Site locations than those observed at on-Site locations in groundwater, in the vicinity of identified source areas. This is expected and consistent with previous monitoring
- Some localised increases in PFAS concentrations in groundwater were reported in a number of locations on-Site and off-Site and are attributed to higher than average rainfall events experienced in 2021 and 2022. This is likely caused by rising groundwater that can sometime mobilise PFAS suspended in the soil profile which are largely in the vicinity of on-Site source areas
- Decreases in PFAS concentrations were observed in groundwater in the vicinity of the Former Fire Training Ground (FFTG). This is expected to be a positive result of remediation that was completed in 2021.

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

PFAS concentrations in surface water and sediment at locations on-Site and off-Site were generally consistent with historical results.

Groundwater Results

During the monitoring period, groundwater was inferred to flow from the Site in a northerly, northwesterly and northeasterly direction towards the Hawkesbury River, which was generally consistent with the historical flow directions.

The measured depth to groundwater was typically shallower (closer to the ground surface) during the monitoring period, particularly following extreme weather events in 2021 and 2022, than previously reported.

The groundwater PFAS plume[1] extents were generally consistent with the plume presented in the 2020 Annual Interpretative Report (AIR) (AECOM, 2021d), with the exception of the following changes identified during this monitoring period:

- Decreasing PFAS concentrations in groundwater at MW040 located in the FFTG following the completion of soil remediation works
- Higher PFAS concentrations were reported on the northern boundary of the Site at MW107I. These increases are inferred to be in response to high rainfall mobilising PFAS from the soil at this location. Therefore, remediation activities are planned for this area which are scheduled to commence in late 2023 to ensure this PFAS does not leave the Site boundary
- MW143 and MW144 were installed to replace MW098 and MW099 which were destroyed during flooding events in March 2021. The new wells were installed along Cupitts Lane south of Cooley Creek within the same hydrogeological unit as the destroyed wells. MW143 and MW144 were sampled for the first time in May 2023, reporting PFAS concentrations an order of magnitude higher than was previously reported at MW098 and MW099. The surface water concentrations nearby these wells were similar, and it is possible the PFAS detects in groundwater are likely to be a result of surface water transport during the flood events. The concentrations here will be monitored for changes at the next sampling event.
- Increasing PFAS concentrations in on-Site well, MW051 in the area used by Fitters, within the alluvial aquifer. This impact was considered to be localised and unlikely to be migrating due to the decreasing PFAS concentrations in down hydraulic gradient wells.

Surface Water Results

The nature and extent of the PFAS impacts in surface water are generally similar to the previous monitoring period, as presented in the 2020 AIR (AECOM, 2021d) with highest concentrations reported in on-Site locations at SW001 and SW002. Off-Site surface water PFAS impacts have been noted to increase during the current monitoring period, which are likely to be attributed to a number of factors including increased PFAS discharge from the Site resulting from increased rainfall observed, tidal fluctuations in the Hawkesbury River, mobilization of PFAS from up gradient sources and increased surface water volumes within the wider Hawkesbury River catchment. This may be also attributable for the reported PFAS concentrations in off-Site groundwater as described above.

There were first-time detects reported at SW018 located down-gradient of SW009 in Rickabys Creek, where the creek discharges to the Hawkesbury River. The location further down gradient of SW018 is SW030 located in the Hawkesbury River which reported lower concentrations of PFOS+PFHxS. New maximum PFOS+PFHxS concentrations were also reported at SW005 and SW037, located within the on-Site Management Area. These changes in surface water contamination distribution are likely to be attributed to the increased rainfall observed at the Site during the monitoring period resulting in surface transport of PFAS from the known source areas.

[1] PFAS contaminant plumes are areas of groundwater with elevated PFAS concentrations that are slowly moving from the source areas in the same direction that the groundwater flows.

Sediment Results

The concentrations of PFAS generally remained within historical ranges over the monitoring period. The highest PFAS concentrations in sediment samples were at SD001 (located within the FFTG). There were new detects of PFAS in sediment in off-Site locations to the east, south, north and north west in 2021.

The changes in the distribution of PFAS in sediments at and surrounding the Site are attributed to the increased rainfall observed at the Site during the monitoring period.

Risk Summary

The Conceptual Site Model (CSM) was developed during the investigation stages) and is summarised in the OMP. The CSM described the links between PFAS sources, transport pathways, and possible exposure scenarios. The OMP monitoring between December 2020 and June 2023 has provided additional data to further understand the changing conditions of the PFAS concentrations in groundwater, surface water and sediment.

While there have been localised decreases and increases in PFAS concentrations in groundwater, surface water and sediment, there is currently no evidence that the overarching risk profile has changed based on the current land use within the Management Area

Conclusions

The monitoring conducted over the period covered within this report is considered to have met the objectives of the SAQP (AECOM, 2023d) and the overall OMP (Defence, 2019a). The following conclusions are based on the data collected during the monitoring period:

- Groundwater depths in 2019 and 2020 (and in some cases in 2017) were reported to be lower than more recent events, which can be attributed to the historically drier conditions observed on the Site during these times, in comparison to higher rainfall conditions observed since February 2020. Overall, the concentrations of PFAS in groundwater, surface water and sediment were generally consistent with the concentrations reported in the 2020 AIR with the exception of new maximums and new detects at selected locations likely attributed to significant rainfall events during the monitoring period
- The groundwater plume extents are generally consistent with the representation presented in the 2020 AIR, with the exception of an apparent extension to the low-level concentration plume in the north due to first-time detects in newly installed monitoring wells in this area. Further monitoring will be undertaken to better understand these results.
- Concentrations of PFAS in groundwater have been observed to decrease in the primary PFAS source area at the FFTG, while localised increases have been detected on-Site. The increase in PFAS concentrations detected on the northern boundary, may have the potential to increase the risk profile from PFAS impacts present in groundwater in this area. Therefore, future remediation activities are planned for this area
- Elevated PFAS concentrations were detected in Rickabys Creek following significant rainfall events however, this is not considered to change the overall risk profile of the Site, given there is no change to the source, receptor and pathways. In general, surface water concentrations were similar to the concentrations reported in the 2020 AIR
- The CSM was reviewed, and based on the results presented within this report, no changes were identified to source, pathway or receptors at the Site and within the Management Area
- Based on the data collected during the monitoring period, no changes to the risk profile were made, and no triggers have been identified which would require a review of the OMP. It is noted that the potential PFAS exposure to off-Site land users within the off-Site Management Area is currently managed through NSW Government precautionary advice by the NSW Environment Protection Authority.

The monitoring network is considered generally appropriate and sufficient for the program objectives. It is recommended that the ongoing monitoring program of groundwater, surface water and sediment is continued to monitor the extent of PFAS, potential migration and any associated risk changes.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at Royal Australian Air Force (RAAF) Base Richmond (the 'Site'). The Site is presented on **Figure F1** in **Appendix A**.

In order to meet the objectives of the OMP, the monitoring was undertaken in accordance with the *Sampling and Analysis Quality Plan* (SAQP) (AECOM, 2023d, Rev K dated 2 May 2023). Note that the SAQP is generally updated prior to each monitoring event.

This Interpretive Report (IR) has been prepared in general accordance with the Defence (2022) *PFAS OMP Annual Interpretive Report Guidance* (Version 0.4) issued in October 2022 (Defence, 2022). The report summarises the results of the monitoring completed in the monitoring period from December 2020 to June 2023 (hereafter referred to as "the monitoring period").

1.1 Purpose and Objective

The objective of the OMP is to set out a program of monitoring to continue to assess the changes in the nature and extent of PFAS within the environment, where Defence's historical use of legacy aqueous film forming foam (AFFF) has led to an identified potentially elevated risk to a receptor, or potential future risk to a receptor within on-Site and off-Site management areas, herein collectively referred to as the Management Area (as shown on **Figure F2**, **Appendix A**).

The OMP (Defence, 2019a) aims to achieve the following:

- An evidence base for targeted and effective risk management of PFAS contamination to protect human health and environmental receptors
- An early indication that additional management of PFAS contamination may be warranted in areas not currently affected by PFAS.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2019b).

1.2 Scope

The scope of works for this IR is to assess changes to the nature and extent of select PFAS over the monitoring period and evaluate if these changes have implications for the understanding of the Conceptual Site Model (CSM) and the risk profile with respect to PFAS impacts at the Site.

This included the evaluation of data reported during the current monitoring period in the following biannual reports, which are included in **Appendix B**:

- Sampling Event Factual Report, May 2021 – PFAS OMP, RAAF Base Richmond. 8 July 2021 (AECOM, 2021a)
- Sampling Event Factual Report, November 2021 – PFAS OMP, RAAF Base Richmond. 29 April 2022 (AECOM, 2022b)
- Sampling Event Factual Report, May 2022 – PFAS OMP, RAAF Base Richmond. 20 December 2022 (AECOM, 2022f)
- Sampling Event Factual Report, November 2022 – PFAS OMP, RAAF Base Richmond. 21 April 2023 (AECOM, 2023c)
- Sampling Event Factual Report, May 2023 – PFAS OMP, RAAF Base Richmond. Revision 0, 3 August 2023 (AECOM, 2023e).

The findings in the following factual reports have also been considered in the review of the CSM and overall PFAS impacts at the Site:

- Memorandum – RAAF Base Richmond – Event #3 Sampling Results – January 2021. 13 July 2021 (AECOM, 2021b)
- Memorandum – RAAF Base Richmond – Event #4 Sampling Results – November 2021. 29 April 2022 (AECOM, 2022a)
- Memorandum – RAAF Base Richmond – Event #5 Sampling Results – February 2022. 23 September 2022 (AECOM, 2022c)
- Memorandum – RAAF Base Richmond – Baseline Event #4 Sampling Results – January 2022. Revision B, 1 November 2022 (AECOM, 2022d).

The findings of the OMP reports were reviewed with consideration to the following non-OMP reports:

- Short Form Remedial Action Plan – PMAP Delivery, RAAF Base Richmond. 10 September 2020 (AECOM, 2020a)
- PFAS Mass Flux Report – PMAP Delivery, RAAF Base Richmond. 1 October 2021 (AECOM, 2021c)
- Remediation Data Gap Assessment Report – Base Wide RAP – PMAP Delivery, RAAF Base Richmond. 13 October 2022 (AECOM, 2022e)
- Targeted Groundwater Investigation – PMAP Delivery, RAAF Base Richmond. 3 April 2023 (AECOM, 2023b)
- Base Wide Remedial Action Plan Addendum – Short Form Remedial Action Plan – PMAP Delivery, RAAF Base Richmond. 6 April 2023 (AECOM, 2023a).

AECOM also compared data presented in this IR to the data presented in the 2020 AIR (AECOM, 2021d).

2.0 Site Setting

2.1 Site Description

The site identification and setting are summarised in **Table 1**, below:

Table 1 Site Identification and Setting Summary

Element	Description
Site ID	0902
Site Location	The Site is approximately 55 km northwest of the Sydney Central Business District (CBD) and is located in the Hawkesbury City Council local government area (LGA), as shown in **Figure 1** in **Appendix A**.
Regional Meteorology	The Bureau of Meteorology (BoM) Richmond RAAF weather station (number 067105) has recorded data since 1993 (temperature) and 1994 (rainfall) and presents a record of approximately 30 years. Review of the available BoM data for the period 1993 to June 2023 indicates the following: • Mean maximum monthly temperatures vary from 17.8°C in July to 30.4°C in January • Mean minimum monthly temperatures vary from 3.7°C in July to 17.9°C in January • Mean monthly rainfall vary from 32.1 mm in August to 115.8 mm in February • Mean annual rainfall is 768.1 mm. The mean monthly rainfall for the monitoring period is provided on **Graph G1** (in **Appendix D**).
Topography and hydrology	The previous investigations reported that the Site is characterised by a series of wide, flat alluvial terraces occurring at varying elevations above the Hawkesbury River. The majority of the Site lies on an elevated terrace defined by the Clarendon Formation and ranges from 18 to 22 metres Australian Height Datum (m AHD). This terrace includes much of the Richmond urban area and localities such as the Richmond golf course. Further to the north and east of the Site, an abrupt drop to a flood plain of the Hawkesbury River exists and is associated with the Lowland Formation. This lower flood plain terrace lies at approximately 6-12 m AHD and includes the sewage treatment plant (STP), Rickabys Drop Zone, and the surface drainage system of natural and modified drains related to Rickabys Creek and Cooley Creek. There are no natural watercourses or natural water bodies at the Site; however, several formed surface water drainage networks, constructed wetland systems and settlement ponds are present. The surface water drainage network comprises a combination of engineered open swale drains, underground stormwater pipes, pits, culverts, and detention storage. The on-Site catchments are presented in the DSI (AECOM, 2018a). The Site is surrounded by natural watercourses to the south, east and north as well as an interconnected network of rural drains on the Richmond Lowlands located to the north of the Site. Surface water from the Site discharges to rural drains to the north, as well as directly into Rickabys Creek to the east. Drainage from the Site primarily discharges in two areas (refer to **Figure F3**):

Element	Description
	• At the southeast boundary into Rickabys Creek which ultimately discharges to the Hawkesbury River • At the northern boundary adjacent to the STP through a series of agricultural drains towards Cooley Creek and Bakers Lagoon before ultimately discharging to the Hawkesbury River. *Northern Tributaries of Rickabys Creek* A series of unnamed rural drains to the northwest, north and northeast form a network of tributaries that flow through the Richmond Lowlands. Review of the topography indicated the headwaters of the drainage network commences at Pughs Lagoon approximately 3 km to the west of Site and adjacent to Richmond Township. Surface water flows generally in an easterly direction through rural properties to combine at the northern boundary of the Site at Rickabys Drop Zone, before flowing along the southeastern Site boundary before intersecting Rickabys Creek approximately 2 km upstream of its junction with the Hawkesbury River. *Rickabys Creek* The headwaters of Rickabys Creek are located approximately 13 km to the south of the Site near Cranebrook. The creek traverses residential and rural land use areas flowing generally in a northerly direction towards Windsor, before crossing under the Hawkesbury Valley Way and flowing along the boundary of the Site. At the eastern boundary of Rickabys Drop Zone, the creek is intersected by its northern tributaries which combine and flow generally in a northeasterly direction towards the junction with the Hawkesbury River at Windsor. *Cooley Creek* A series of ephemeral, unnamed rural drains to the west and northwest of the Richmond Lowlands form a surface water network that drain into Bakers Lagoon at the headwaters of Cooley Creek. Additionally, treated effluent from the on-Site STP is transferred through an underground pipe and discharged into Bakers Lagoon. At the southern boundary of the lagoon, Cooley Creek flows in an easterly direction through rural properties for approximately 3 km before the junction with the Hawkesbury River. *Bakers Lagoon* Bakers Lagoon is a key waterbody feature in the Richmond lowlands and drains to Cooley Creek in the east and to an un-named drain to the north. At the southern boundary of the lagoon Cooley Creek flows in an easterly direction towards the Hawkesbury River. During the DSI (AECOM, 2018a) the lagoon was observed to be clear of vegetation with dimensions of 120 m in width and 500 m in length. *Pughs Lagoon* Pughs Lagoon sits at the headwaters of the Rickabys Creek Tributaries and is located to the west of residential properties at Richmond and adjacent to rural properties to the west and north. During the DSI (AECOM, 2018a) the Lagoon was observed to be clear of vegetation with dimensions of 60 m in width and 500 m in length. The Lagoon discharges to an agricultural drain located to the northeast.

Element	Description
Geology and Hydrogeology	The Site is located within the Cumberland Basin, a low lying, gently dipping Tertiary aged basin situated at the western margin of the Sydney Basin (Jones and Clark,1991). The main geological units of the Cumberland Basin in the Hawkesbury-Nepean area are based on the Penrith 1:100,000 Geological Map (NSW Geological Survey). The base of the Cumberland Basin is characterised by Upper Triassic shales and sandstones of the Wianamatta Group, and represents the last deposition before younger, more unconsolidated, alluvial and fluvial deposition during the Tertiary to Holocene periods. The general geology of the Management Area can be divided into the following main geological features: • Basement Rocks formed during the Triassic period (Wianamatta Group Shales) • Unconsolidated deposits formed during the Miocene Epoch (Londonderry Clay and Rickabys Creek Gravels) • Unconsolidated deposits formed during the Pleistocene to early Holocene (Clarendon Formation) Epochs • Unconsolidated deposits formed during the Pleistocene to mid Holocene (Lowlands Formation) Epochs • Holocene consisting of gravel banks, sand islands and points bars related to the Hawkesbury-Nepean River and tributary streams. The hydrogeology of the Management Area can be divided into two subunits: *Fractured Rock Aquifers* Fractured rock aquifers include the Wianamatta Group and the Hawkesbury Sandstone which both have variable groundwater yields (Jones and Clark 1991). The Hawkesbury Sandstone aquifer has historically been the most reliable water source in the region with uses for irrigation, stock water and domestic purposes. The Wianamatta Group aquifer is characterised by yields of 0.2 - 5.5 L/s and higher salinity making it typically unsuitable for stock watering. Typical salinity for the Hawkesbury Aquifer ranges between 200 – 1,200 mg/L and is generally too saline for potable consumption, whereas the Wianamatta Group aquifer typically has salinity values ranging between 5,000 – 50,000 mg/L (Defence, 2019b). *Unconsolidated Aquifers* Younger, unconsolidated aquifers that provide more accessible water supply to areas surrounding the Site include the Clarendon Formation Aquifer (CFA) and Lowlands Formation Aquifers (LFA). The Rickabys Creek Gravel is characterised by a high matrix content of sand and clay, and stratigraphically underlies the Londonderry Formation (Jones and Clark, 1991). The Rickabys Creek Gravel was only intersected in one borehole to the east of the Site during the DSI (AECOM, 2018a), indicating that the unit may have a limited presence within the Site.

Element	Description
Vegetation	The DSI report (AECOM, 2018a) noted that the majority of Rickabys Drop Zone and portions of the Site are covered in managed grassland which is regularly mown. Remnant native vegetation on the Site is considered to be limited to the eastern and southern boundaries of Rickabys Drop Zone, along a portion of Rickabys Creek and a tributary of Rickabys Creek. Based on ecological investigations conducted at the Site, it is expected that portions of the Site would provide habitat for a range of terrestrial invertebrates, terrestrial mammals and birds. Utilisation of on-Site areas by ecological receptors is likely to be seasonal, particularly for some populations of birds. A constructed wetland is located on Rickabys Drop Zone, which comprises a number of ponds, some connected by culverts. During the DSI (AECOM, 2018a), the wetland was observed to be heavily vegetated with reeds, lilies and aquatic grasses. The DSI report (AECOM, 2018a) noted that the majority of the off-Site environment is used for agricultural and residential purposes. The agricultural land is predominantly used for intensive plant agriculture (turf farming) and market gardens. More diverse terrestrial ecological communities are considered likely to frequent the banks of Bakers Lagoon, Rickabys Creek, Cooley Creek and Hawkesbury River.
Current land use (on-Site)	• The Site comprises approximately 414 hectares of land and is an active RAAF Base and a critical Defence facility • The Site has become the home of Air Mobility Group and Number 84 Wing and is a strategically important air logistics hub for the Australian Defence Force. The Site is zoned ‘SP1 Aerodrome/Defence Services’ under the Hawkesbury Local Environment Plan, 2012. The Site comprises ‘landside’ and ‘airside’ areas: - Landside areas are partly covered by hardstand and pavement consisting of concrete, asphalt roadways and low-rise buildings which include accommodation properties and facilities - Airside areas consist of taxiways, aprons and the main runway. The Site comprises three distinct areas: • RAAF Base Richmond • Rickabys Creek Drop Zone. This area is Defence owned land and considered part of the Site, bound by Percival Street to the west, Ingolds Lane and land used for intensive plant agriculture to the north, Rickabys Creek in the east and private property to the south. This area contains Fuel Farm 2, the third Base hospital and numerous smaller support service buildings • The STP and Trade Waste Plant (TWP): Located to the north of the Site on the northern side of Dight Street. The STP and TWP are bound to the east, north and west by intensive plant agriculture (primarily turf farming).

Element	Description
Current Land Use (off-Site)	Land uses surrounding the Site currently and historically include: • Richmond Road to the south, Percival Street to the east, Dight Street to the north and residential and commercial properties to the west • Semi-rural land uses, predominantly consisting of intensive plant agriculture (turf farming) and scattered market gardens located within Cornwallis (north and east of the Site) • Rum Corps Barracks Golf Course is also located to the east of the Site • Land with primarily low density, single dwelling houses to the west of the Site within the suburb of Richmond. Immediately west of the Site is a small light industrial area and St Monica's Primary School • Land to the south of the Site includes special land use in the form of Hawkesbury showground and racecourse precinct • Environmental conservation - Bakers Lagoon, which occupies approximately 10.8 ha located north of the Site. The projected land use in the Management Area is not anticipated to materially change within the next 5 years.

2.2 Management Area

In August 2019, Defence released the PMAP for the Site, which details the management measures to address soil and water contamination concerns and potential risks resulting from PFAS. The Management Area comprises three distinct areas (refer to **Figure 2** in **Appendix A**):

1. ***On-Site Management Area****:* which includes the Site, inclusive of the Defence owned land to the east of Percival Street (Rickabys Drop Zone)
2. ***Bakers Lagoon Management Area****:* which includes Bakers Lagoon and associated drains/creeks located to the north of the Site
3. ***Off-Site Management Area****:* which includes private properties to the north, west and southeast of the Site.

The Management Areas are also relevant to the OMP, in regard to where ongoing monitoring of PFAS concentrations in either groundwater, surface water or sediment will be undertaken to allow for continued assessment of risks to receptors that may be potentially affected by PFAS.

2.3 PFAS Source Areas and PFAS Impact

The PMAP (Defence, 2019b) identified the following locations as PFAS source areas which have been grouped based on their location and proximity on-Site:

- *Group 1 Source Area*: Former Fire Training Ground (FFTG), Airfield Foam Cannon Testing Area (AFTCA)
- *Group 2 Source Area*: STP
- *Group 3 Source Area*: Hangar 54, Fire Station Building 291
- *Group 4 Source Area*: Fuel Farm 2, Tanker Parking Area (Former Fuel Farm 1), area used by fitters.

Subsequent works undertaken by the PMAP Delivery team since the PMAP's development have further refined the understanding of PFAS Source Areas on the Site. These additional works are listed below and are discussed in **Section 6.0**:

- AECOM (2020a). Short Form Remedial Action Plan, Former Fire Training Ground, RAAF Base Richmond. 10 September 2020

- AECOM (2022f). Remediation Data Gap Assessment Report – Base Wide RAP – PMAP Delivery, RAAF Base Richmond. 13 October 2022
- AECOM (2023b). Base Wide Remedial Action Plan Addendum – Short Form Remedial Action Plan – PMAP Delivery, RAAF Base Richmond. 6 April 2023
- AECOM (2023a). Targeted Groundwater Investigation – PMAP Delivery, RAAF Base Richmond. 3 April 2023.

Based on the outcomes of the PMAP Delivery works the following were confirmed as PFAS Source Areas:

- FFTG
- Area south of the FFTG (Flying Club Taxiway verges)
- Localised PFAS source near MW107I and Foam Test Facility (FTF)
- Fire Station Building

Note that the other Source Areas as listed in the PMAP, including the STP, Hangar 54, Fuel Farm 2 and the Tanker Parking Area / Former Fuel Farm contain critical infrastructure and Defence operations, which restrict access for further investigation and potential management / remediation.

The Source Areas are presented on **Figure F3**, **Appendix A**.

The nature, extent, fate and transport of PFAS within the Management Area, based on the DSI report (AECOM, 2018a), are summarised in **Section 2.3.1** and **Section 2.3.2** below.

2.3.1 Groundwater Impact

The DSI (AECOM, 2018a) identified multiple overlapping PFAS groundwater plumes associated with identified on-Site source areas, resulting in the combined PFAS plume being approximately 2 km long and 5 km wide (across the axis of migration), with majority of the groundwater impacts limited to within the Site boundary. The investigation reported that PFAS concentrations decrease with distance from the Site.

The dominant groundwater flow direction was reported to be generally to the northeast. The multiple on-Site sources have contributed to PFAS presence in groundwater in the Clarendon Formation Aquifer (CFA), which extends into the Lowlands Formation Aquifer (LFA).

An isolated detection of PFAS adjacent to Cooley Creek (approximately 1 km to the north of the Site) has been interpreted as not being connected to the main plume further to the south and may be the result of surface water interacting with groundwater.

2.3.2 Surface Water Impact

All major on-Site drainage systems sampled during the DSI (AECOM, 2018a) were found to contain PFAS, additionally PFAS has been reported in the locations where surface water discharges from the Site (refer to **Figure F3**). These locations include:

- Runoff from catchments north and northwest of the Site, which discharge off-Site into tributaries of Rickabys Creek on the Richmond Lowlands
- Runoff from catchment south and east of the Site, which discharge off-Site into Rickabys Creek
- Treated effluent from the on-Site STP which discharges off-Site to Bakers Lagoon.

Ultimately, all surface water discharged from the Site via major drainage networks and creeks, flows towards the Hawkesbury River. PFAS has been detected in the Hawkesbury River including upstream of the Site (south of the bridge at North Richmond). Note that the DSI (AECOM, 2018) identified multiple potential regional PFAS sources across the broader Hawkesbury catchment, including upstream of the Site.

The PMAP (Defence, 2019b) noted that it is considered likely that flooding from the major drains has and will disperse PFAS to surface soils and potentially to shallow groundwater as water levels fall and infiltration occurs.

3.0 Sampling and Analytical Methodology

3.1 Sampling Methodology

The sampling methodology is presented in the SAQP (AECOM, 2023d).

The SAQP (AECOM, 2023d) outlines the proposed schedule and rationale for sampling, prescribing six-monthly groundwater, surface water and sediment sampling at the Management Areas.

The SAQP provides the list of groundwater monitoring wells, surface water and sediment locations sampled during each sampling event, along with the sampling methodology for each of the media. The current SAQP has been included in **Appendix B.**

A summary of the OMP monitoring events completed in accordance with the SAQP (AECOM, 2023d) between December 2020 and June 2023, is provided in **Table 2**.

Table 2 Summary of Monitoring Events

Monitoring Event (Sampling dates)	Scope as per SAQP	Samples Collected	Analysis
Biannual Sampling – May 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2021a) (3 – 7 May 2021)	80 GW samples	76 GW samples	PFAS extended suite, inorganics, metals
	22 SW samples	22 SW samples	
	21 SD samples	19 SD samples	
Biannual Sampling – November 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022b) (22 – 29 November and 14 December 2021)	92 GW samples	88 GW samples	PFAS extended suite, inorganics, metals
	23 SW samples	22 SW samples	
	22 SD samples	21 SD samples	
Biannual Sampling – May 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022f) (24 – 31 May 2022 and 16 June 2022)	90 GW samples	80 GW samples	PFAS extended suite
	23 SW samples	21 SW samples	
	22 SD samples	20 SD samples	
Biannual Sampling – November 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2023c) (2 – 21 November 2022)	84 GW samples	80 GW samples	PFAS extended suite
	21 SW samples	20 SW samples	
	21 SD samples	20 SD samples	
Biannual Sampling – May 2023 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2023e) (8-15 May 2022 and 9 June 2023)	83 GW samples	81 GW samples (+ 2 locations re-sampled)	PFAS extended suite
	23 SW samples	21 SW samples (+ 2 locations re-sampled)	
	22 SD samples	20 SD samples	

Notes: SW = surface water; GW = groundwater, SD = sediment

3.2 Deviations from SAQP Requirements

Deviations from the scope outlined in SAQP for the monitoring period are summarised in **Table 3** below.

Table 3 Deviations from SAQP during Biannual Sampling Events – May 2021 to June 2023

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Biannual Sampling Event - May 2021 (AECOM, 2021a)		
Collection of groundwater samples from 78 locations.	Two residential groundwater bores (POT001 and POT002) could not be sampled as they had been decommissioned by the property owner prior to the May 2021 sampling event. These were replaced by alternative locations (denoted as MW120 and MW121) within the same property. Two off-Site monitoring wells (MW006, located in Rickabys Drop Zone and MW099, located along Cupitts Lane) appeared to have sustained damage during the flooding in March 2021 and could not be sampled during the May 2021 monitoring event. The data logger in MW099 could not be located.	AECOM does not consider the lack of sampling from these locations to constitute a significant data gap as the existing monitoring well network provides adequate coverage of these locations. Given that 12 months of continuous water level logger data had previously been collected at well MW099 (up to November 2020), the existing data set was considered sufficient to assess the potential for seasonal variation for the purposes of the OMP.
Collection of groundwater samples using HydraSleeves™ deployed prior to the sampling event.	Sampling at five locations (MW120, MW121, MW033, MW045 and MW074) were completed using alternate sampling methods, which were collected by the use of dedicated, disposable bailers due to the following: • Not practical to deploy HydraSleeves™ in residential groundwater bores at MW120 and MW121. • HydraSleeves™ failed to deploy at MW033, MW045, MW074.	Groundwater PFAS results at these locations were within the historical range, indicating the change in sampling methodology was unlikely to have impacted the reliability or comparability of the data.
At the completion of the sampling event, new HydraSleeves™ are to be deployed ahead of the next scheduled event.	HydraSleeves™ were not replaced in 24 monitoring wells (MW005, MW006, MW007, MW009, MW010, MW020, MW032, MW033, MW041, MW043, MW047, MW050, MW051, MW052, MW053, MW056, MW057, MW058, MW059, MW060, MW061, MW072, MW073 and MW078) following sampling as these locations were due to be sampled by the Defence Estate Maintenance and Operation Services (EMOS) contractor completing the Regional Water Quality Monitoring Program (RWQMP) event before the November 2021 event.	No impact as the new HydraSleeves™ were subsequently installed in these wells prior to the November 2021 OMP sampling event.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Collection of sediment samples from 21 locations.	Two sediment samples (SD018 and SD023) could not be collected during the May 2021 due to bank instability (safety concern) resulting from the flooding in March 2021.	The lack of data for the May 2021 event is considered to have a minimal impact on the data set, as these locations have historical data and were subsequently accessed, sampled and analysed as part of the November 2021 biannual sampling event.
Collection of surface water samples by lowering a laboratory supplied container into the water with the cap immediately applied once the container is full.	Two surface water samples (SW018 and SW023) could not be collected during the May 2021 due to bank instability (safety concern) resulting from the flooding in March 2021.	The lack of data for the May 2021 event is considered to have a minimal impact on the data set, as these locations have historical data and were subsequently accessed, sampled and analysed as part of the November 2021 biannual sampling event.
Biannual Sampling Event - November 2021 (AECOM, 2022b)		
Collection of groundwater samples from 92 locations.	Seven groundwater locations (MW006, MW099, MW044, MW045, MW117, MW118 and MW119) could not be sampled during the November 2021 event, due to the following: • MW117, MW118 and MW119 appeared to have been compromised by surface water influx, as water level was at ground surface • Monitoring wells MW006 (located in Rickabys Drop Zone) and MW099 (located off-Site along Cupitts Lane) were observed to have been destroyed • Monitoring wells MW044 and MW045 (located on-Site) were located underneath stockpiles of construction material.	AECOM does not consider the lack of sampling from these locations to constitute a significant data gap as the existing monitoring well network provides sufficient coverage of these locations.
Collection of groundwater samples by using HydraSleeves™ deployed prior to the sampling event.	Samples at six locations (MW007, MW009, MW072, MW074, MW120 and MW121) were collected using dedicated disposable bailers as HydraSleeves™ were either not present, did not deploy appropriately or insufficient water was available during the November 2021 event.	As the concentrations of PFAS reported in these samples were either within the historical range for each location, or within the same order of magnitude as historical results, the change in sampling methodology is not considered to impact upon the reliability or comparability of the data for the purposes of the OMP.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
		AECOM successfully sampled wells MW007, MW074, MW120 and MW121 using HydraSleeves™ during the subsequent OMP sampling event in May 2022.
20% of groundwater and surface water samples to be analysed for nutrients (ammonia, nitrate, nitrite, phosphorous) and selected metals (aluminium, bromide, iron and manganese).	Due to a low volume of groundwater being present in location MW009, there was only enough sample for PFAS analysis, which resulted in approximately 17% of samples to be analysed for the expanded suite.	Given that the actual rate was only marginally lower than the target rate of 20%, AECOM considers that the data is sufficient for the purposes of the OMP.
Collection of surface water samples from 23 locations.	Surface water sample location (SW081), north of Bakers Lagoon was not accessible during the November 2021 event as the road was closed due to council road rectification works following the damage sustained during significant flood event in March 2021.	AECOM notes that concentrations of PFAS in surface water at this location remain a data gap as this location has not been sampled previously and as of May 2023 this location remains inaccessible due to subsidence.
Collection of sediment samples from 22 locations.	AECOM was unable to collect a sample from proposed sediment location SD081 (north of Bakers Lagoon) as the road was closed due to council road rectification works following the damage sustained during a significant flood event in March 2021.	AECOM notes that concentrations of PFAS in sediment at this location remain a data gap. This location has not been sampled previously and as of May 2023, this location remains inaccessible due to subsidence.
Collection of surface water samples by lowering a laboratory supplied container into the water with the cap immediately applied once the container is full.	Due to access considerations, the surface water sample from SW037 was collected using a dedicated disposable bailer.	As the concentrations of PFAS reported in this sample were within the historical range for this location, the change in sampling methodology is not considered to impact upon the reliability or comparability of the data for the purposes of the OMP.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Biannual Sampling Event - May 2022 (AECOM, 2022f)		
Collection of groundwater samples from 90 locations	10 groundwater locations were not sampled during the May 2022 event, due to the following: • MW044 and MW045 could not be located (covered by new turf), alternate location MW046 sampled • MW058 damaged monument, sufficient local coverage, no alternate location required • MW086 buried by stockpile, sufficient local coverage, no alternate location required • MW095 considered destroyed, local wells MW091 and MW092 have been substituted. Replacement wells may be required in this area and are being considered by Defence. • MW117, MW118, MW119 considered compromised and removed from OMP at the direction of Defence (correspondence dated 24 May 2022) • MW120, MW121 private property bores are no longer accessible.	The lack of gauging and sampling data for most locations is not considered to have a significant impact on the dataset, or present a significant data gap, as the existing monitoring well network provides sufficient coverage in this area. Alternative sampling locations would be explored for MW120 and MW121 as this presents as a potential data gap in assessing the off-Site extent of PFAS in groundwater to the north of the Site, however as of May 2023 no suitable replacement locations had been identified.
Collection of surface water samples from 23 locations	Two surface water locations were not sampled during the May 2022 event due to the following: • SW081 could not be accessed due to flood damage to access road • SW032 private property location was no longer accessible.	Absence of sampling data at these locations presents a potential data gap for assessing PFAS concentrations in the Bakers Lagoon area. As of May 2023, no suitable alternative sampling locations have been identified to replace SW081 and SW032.
20% of groundwater and surface water samples for nutrients (ammonia, nitrate, nitrite, phosphorous) and selected metals (aluminium, bromide, iron and manganese)	Only 19% of groundwater and surface water samples were analysed for the expanded suite (MW095 and SW032 were not sampled as per details above).	Given that the actual rate was only marginally lower than the target rate of 20%, AECOM considers that the data is sufficient for the purposes of the OMP.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Collection of sediment samples from 22 locations.	Two sediment locations were not sampled during the May 2022 event, due to the following: • SD081 could not be accessed due to flood damage to access road • SD032 private property location was no longer accessible.	Lack of sampling data at these locations presents a potential data gap for assessing PFAS concentrations in the Bakers Lagoon area. As of May 2023, no suitable alternative sampling locations have been identified to replace SD081 and SD032.
Collection of gauging and geochemical parameter data at each groundwater location	Due to the opportunistic nature of the groundwater sampling undertaken on 16 June 2022, no gauging or geochemical parameter data was collected during the sampling of monitoring well MW080.	The lack of gauging and geochemical data for location MW080 is not considered to impact upon the objectives of the OMP.
Biannual Sampling Event - November 2022 (AECOM, 2023c)		
Collection of samples, and associated gauging data and field parameters, from 84 groundwater locations.	Four groundwater monitoring locations were not sampled during the November 2022 event, due to the following: • MW044 could not be located and is considered likely to have been destroyed during recent construction works in 2021/2022. Sufficient coverage in the area provided by MW045 and MW046 • MW086 buried by stockpile, sufficient local coverage, no alternate location required • MW097 and MW098 could not be located and are considered likely to have been destroyed during recent floods.	The lack of gauging and sampling data for MW097 and MW098 presents a data gap in the off-Site coverage of the down-hydraulic extent of the identified PFAS groundwater plume. AECOM subsequently installed two wells to replace MW097 (new well MW143) and MW098 (new well MW144) in April 2023, which were sampled during the May 2023 sampling event to address this data gap.
Collection of samples, and associated field parameters, from 22 surface water locations.	Two surface water monitoring locations were not sampled during the November 2022 event, due to the following: • SW001 was dry and could not be sampled. The location was visited on three separate occasions over the course of the sampling event, and the location was confirmed dry each time • SW081 was inaccessible, due to the road closure and rectification works.	The lack of sampling data for SW001 is not considered to have a significant impact on the data or present a significant data gap, given that the location is an ephemeral drainage line and is not expected to have water present at all times. The lack of sampling data for SW081 continues to present a data gap in the understanding of PFAS migration from Bakers Lagoon to the Hawkesbury River. As

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
		of May 2023, no suitable alternative sampling locations have been identified to replace SW081.
Collection of sediment samples from 21 locations.	Sediment location SD081 was inaccessible, due to the road closure and rectification works associated with a recent landslip and could not be sampled during this sampling event.	The lack of sampling data for SD081 continues to present a data gap in the understanding of PFAS migration from Bakers Lagoon to the Hawkesbury River. As of May 2023, no suitable alternative sampling locations have been identified to replace SD081.
Samples from monitoring wells MW001, MW009, MW010, MW022, MW075, MW081, MW082, MW091, MW097 and MW098 are to be analysed for additional analytes including nutrients (ammonia, nitrate, nitrite, phosphorous), selected metals (aluminium, bromine, iron and manganese) and anions/cations.	The additional analytes were not analysed for 3 of the 10 scheduled groundwater monitoring locations. The additional analytes were inadvertently not scheduled for the sample collected from monitoring well MW082, due to field error, and was not able to be scheduled for monitoring wells MW097 and MW098, as these locations could not be sampled during this sampling event.	The lack of additional analytes tested at select locations is not considered to have a significant impact on the data set, or present a significant data gap, given that sufficient non-PFAS data was collected during the initial OMP implementation period (a three-year period). The original objective for conducting the additional analysis was to identify potential correlation between PFAS and non-PFAS concentrations, in order to identify any significant off-Site contributions to PFAS concentrations from agriculture or heavy industries. No correlation was found based on the data collected to date. As such, the requirement to collect and analyse non-PFAS analytes was re-assessed in conjunction with Defence's current Lead Consultant (AECOM). This requirement was determined to no longer be necessary and therefore analysis of non-PFAS analytes was removed from the OMP

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
		scope of works ahead of the May 2023 sampling event.
Biannual Sampling Event - May 2023 (AECOM, 2023e)		
83 groundwater monitoring locations are required to be sampled, gauged and water quality field parameters collected during each monitoring event.	Groundwater samples and associated gauging data and water quality field parameters, were not collected from 2 of the 83 scheduled groundwater sampling locations due to the following reasons. Groundwater monitoring well MW027 could not be located and could not be gauged and sampled during this event. The well could not be located despite the use of a metal detector which is considered likely to have been destroyed or covered over by the construction works in the area. Groundwater monitoring well MW086 was covered by a soil stockpile from recent road rectification works along Percival Street and could not be gauged and sampled during this event.	The lack of gauging and sampling data for MW027 is not considered to have a significant impact on the data set, or present a significant data gap, as other nearby monitoring wells (MW14, MW15 and MW034 located down hydraulic gradient of MW027) were able to be gauged and sampled during this event. The lack of gauging and sampling data for MW086 is not considered to have a significant impact on the data set, or present a significant data gap, as other monitoring wells (MW048, MW001, MW114, MW091 and MW092) in the general vicinity of MW086 were able to be gauged and sampled during this event. These wells are considered to provide sufficient coverage of this area.
Collection of samples from one round of sampling per event.	Groundwater monitoring wells MW143 and MW144 are newly installed wells that were added to the scope ahead of the May 2023 sampling event to replace lost wells MW097 and MW098, respectively, along the road verge of Cupitts Lane. The locations were sampled and initial PFAS concentrations were reported to be outside of the historical ranges previously reported for MW097 and MW098. The original samples were reanalysed, and PFAS concentrations were confirmed. Given these locations are key to understanding PFAS distribution to the north, the wells were re-sampled on 9 June 2023 to confirm the original results after the completion of the May 2023 sampling event.	The additional sampling data for MW143 and MW144 provides confirmation of the original results and confidence in the reported concentrations. The update to the data set and changes to the understanding of the Conceptual Site Model have been included in this IR.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Collection of samples, as well as associated water quality field parameters, from 23 surface water locations.	Surface water location SW081 was inaccessible, due to the road closure and rectification works associated with a landslip and could not be sampled during this sampling event. Surface water location SW085 was added to the scope ahead of the May 2023 sampling event to target Bakers Lagoon and requires access from a private property near the waterbody. The proposed location was observed to be dry and not representative of Bakers Lagoon waterbody during this sampling event, and therefore not sampled. AECOM considers that the new location accessed (SW085) appeared to be dry during prolonged dry periods and therefore there is no connectivity with Bakers Lagoon during these dry periods.	The lack of sampling data for SW081 targeting Bakers Lagoon and SW085 continues to present a data gap in the understanding of PFAS migration from Bakers Lagoon to the Hawkesbury River. AECOM considers that the new location accessed (SW085) was not representative of Bakers Lagoon during this sampling event given that during dry periods there appears to be no connectivity with Bakers Lagoon. SW085 will be sampled during future sampling events if there is significant rain for the waterbody to be connected with Bakers Lagoon.
Collection of samples from one round of sampling per event.	Surface water locations SW015 and SW016 are located in the vicinity of the nearby newly installed groundwater monitoring wells (MW143 and MW144), along the road verge of Cupitts Lane. The locations were re-sampled together alongside MW143 and MW144 on 9 June 2023, following receipt of initial sampling results for these locations sampled during the May 2023 sampling event. Note that these surface water locations provide data to assess whether there is inter-connectivity between surface water and groundwater in this area by assessing the correlation in PFAS concentrations in surface water and groundwater.	The additional sampling data for SW015 and SW016 provides the data to enable comparison of surface water and groundwater in this area, and whether the concentrations in groundwater may be attributed to surface water transport and infiltration during flood events.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on data set
Collection of sediment samples, as well as associated field data from 22 locations.	Sediment sampling location, SD081 was inaccessible, due to the road closure and rectification works associated with a recent landslip and could not be sampled during this sampling event. Note that sediment sample location SD085 was added to the scope ahead of the May 2023 is sampling event to target Bakers Lagoon and requires access from a private property near the waterbody. The proposed location was observed to be dry and not sampled. AECOM observed that surface water and sediment locations (SW085 / SD085) were dry during prolonged dry periods and therefore there is no connectivity between the sample location and Bakers Lagoon, during these dry periods. As such, surface water and sediment sampling were not undertaken.	The lack of sampling data for SD081 and SD085 continues to present a data gap in the understanding of PFAS migration from Bakers Lagoon to the Hawkesbury River. At the time new location SD085 was visited, there appeared to be no connectivity between this location and Bakers Lagoon. AECOM will attempt to re-visit the new location, SD085, and attempt to collect a sample during future sampling events if there is significant rain for the waterbody to be connected with Bakers Lagoon.

4.0 Quality Assurance and Quality Control

Data validation pertaining to the data in this report has been previously completed and discussed within the individual factual reports listed in **Section 1.2**.

Data validation procedures employed in the assessment of the field and laboratory Quality Assurance and Quality Control (QA/QC) data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of the factual and interpretive reports.

5.0 Assessment Criteria

Adopted screening criteria references national guidance in the form of PFAS National Environmental Management Plan (NEMP) (Heads of Environment Protection Authority Australia and New Zealand [HEPA], 2000), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. At the time of preparing this report, a number of guidance documents were available in Australia and referred to including:

- HEPA, 2020. PFAS NEMP Version 2.0. January 2020
- Department of Health (DoH), April 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. This document is based on the works undertaken by FSANZ in 2017 (FSANZ 2017)
- National Health and Medical Research Council (NHMRC), 2019. Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water. August 2019 (NHMRC 2019)
- National Environment Protection Council (NEPC), 1999. National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) Schedule B1 (As amended in 2013).

The adopted PFAS screening criteria to assess the surface water and groundwater analytical results are presented in **Table 4** (applicable to the assessment of human health) and **Table 5** (applicable to the assessment of ecological receptors).

Table 4 PFAS Criteria: Human Health

Pathway	Compound	Criteria	Comment / Reference
Drinking water – groundwater	PFOS+PFHxS	0.07 µg/L	The values presented in the PFAS NEMP, 2020 are from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH summarise the Tolerable Daily Intake (TDI) for Perfluorooctanesulfonic acid (PFOS) and Perfluorooctanoic acid (PFOA) from Food Standards Australia New Zealand (FSANZ, 2017) and the methodology described in Chapter 6.3.3 of the National Health and Medical Research Council's (NHMRC) Australian Drinking Water Guidelines (ADWG), 2016 to determine drinking water values. For Perfluorohexanesulfonic acid (PFHxS), DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'. *All groundwater samples were screened against these criteria.*
	PFOA	0.56 µg/L	

Pathway	Compound	Criteria	Comment / Reference
Recreational use – surface water	PFOS+PFHxS	2 µg/L	The previous values presented in the PFAS NEMP Version 1.0, HEPA 2018 were from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. However, in 2019 the NHMRC's water quality advisory recommended an alternative methodology to calculate recreational guideline value. Instead of basing it on an ingestion rate of 0.2 L of water per day (as per the *Australian Drinking Water Guidelines* [ADWG] formula), NHMRC (2019) adjusted this rate with consideration of an event frequency (150 events / year) to calculate an annual ingestion rate of 30 L per year. These NHMRC (2019) values have since been adopted under Version 2.0 of the PFAS NEMP (HEPA, 2020). *All surface water samples were screened against these criteria.*
	PFOA	10 µg/L	

Table 5 PFAS Criteria Summary: Ecological

Media	Chemical	Criteria	Comment/Reference
Water (Freshwater) – surface water and groundwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP Version 2.0 (HEPA, 2020) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality – draft default guideline values. AECOM understands that these guidelines are currently being reviewed and will consider the appropriateness of considering any future revision. The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory limit of reporting (LOR) is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. *All groundwater and surface water samples were screened against these criteria. Assessment of these criteria against groundwater results are relevant at the point of discharge.*
	PFOA	19 µg/L	

It is noted that at the time this report was prepared no HEPA (2020) endorsed criteria was available for PFAS in sediments.

It is noted that for the purpose of presenting data within this report, AECOM has focussed on PFOA, PFOS and PFOS+PFHxS i.e., those PFAS for which there is either human health and/or ecological assessment criteria.

6.0 Contextual and Ancillary Information

6.1 PFAS Projects

In addition to the reported works completed under the PFAS OMP (**Section 1.2**), the following activities in relation to PFAS are being completed at the Site.

6.1.1 PFAS Mass Flux Study

A mass flux study was undertaken between May 2020 and January 2021 to estimate the PFAS mass discharge over the Site boundary in groundwater and surface water. The outcomes of this study, including annual PFAS discharge estimates from the Site, were reported in PFAS Mass Flux Report (AECOM, 2021c). The scope of the study included the following:

- Installation of 10 new groundwater monitoring wells to enable flux monitoring across three transects on the Site, followed by two rounds of groundwater monitoring at these locations
- Installation of V-notch weirs and water level sensors at two surface water locations (SW002 and SW009) considered as the terminal point of the two major surface water catchments on-Site, followed by three rounds of baseline (baseflow) sampling and three rounds of event flow (rainfall event) sampling.

Two rounds of groundwater monitoring were performed across the three-groundwater flux transects, whilst four rounds of baseline (baseflow) surface water sampling and five rounds of event flow (rainfall event) surface water sampling were undertaken. Additionally, hydrogeological characteristics were analysed via groundwater slug testing and laboratory analysis for aquifer particle size distribution (PSD).

Following field and analytical testing, the annual site wide PFOS+PFHxS mass discharge was estimated to be 75 grams per year for groundwater and 2,576 grams per year for surface water. This confirmed that surface water flux was the major contributor of off-Site PFAS mass flux, accounting for approximately 97% of the annual site-wide mass discharge.

Based on the results of investigations to date, it is inferred that PFAS discharge off-Site via surface water increases in response to rainfall. This is based on:

- on average the Site receives rainfall greater than 1 mm for 73 days per year, and that the 73 days of rain is likely to account for around 50% of the total PFAS discharge from the Site to the receiving environment
- At SW002 rainfall events account for 53.8% of the annual PFAS discharge in comparison to baseflow conditions
- At SW009 rainfall events account for 46.2% of the annual PFAS discharge comparison to baseflow conditions.

Based on these findings, future on-Site remediation / management activities would be prioritised to reduce the PFAS mass flux to surface water.

6.1.2 Short Form RAP - Former Fire Training Ground

A Short Form Remedial Action Plan (RAP) (AECOM, 2020a) was developed to undertake the remediation of the FFTG, which was identified as being the likely dominant source of PFAS contamination (AECOM, 2018a). The Short Form RAP included site-specific remediation end points with the end goal of achieving an order of magnitude reduction in PFAS mass discharge to the environment.

The selected remedial option in the RAP was to:

a. excavate low PFAS impacted soils (PFOS+PFHxS concentrations <15 mg/kg), stabilise the excavated soils with powdered activated carbon (PAC) and reinstate the stabilised soils; and

b. undertake off-Site thermal destruction of high PFAS impacted soils (PFOS+PFHxS concentrations >15 mg/kg).

The RAP implementation is discussed in **Section 6.1.3**.

6.1.3 Soil Remediation - Former Fire Training Ground

The Short Form RAP was implemented by AECOM between March 2021 and July 2021, with the excavation of approximately 4,000 m^3 of soil from the FFTG.

The soil with high concentrations of PFAS (i.e. PFOS+PFHxS concentrations >15 mg/kg), equating to approximately 1,417 tonnes was thermally destroyed at a licensed facility in Victoria. The remaining soil was stabilised with PAC and then backfilled into its original excavation.

The results of post-remediation testing confirmed a greater than 99% reduction in PFAS surface water runoff from the FFTG and an estimated 136 kg of PFAS was managed during the works.

Defence will continue to monitor surface water and groundwater at the FFTG via the bi-annual monitoring program managed under the OMP to assess the long-term effectiveness of the remediation works.

6.1.4 Targeted Groundwater Investigation

A Targeted Groundwater Investigation (AECOM, 2023b) was undertaken following significant increases in PFAS concentrations in MW107I, located on the northern Site boundary, to assess the potential source and its implication on the CSM. This increase in PFAS concentration was not consistent with the existing CSM, as it was currently understood that surface water was the primary migration pathway of PFAS discharge from the Site into off-Site areas.

The scope included a targeted investigation to identify:

- If there was a potential new PFAS source at the northern Site boundary
- The magnitude of PFAS impacts at the northern Site boundary adjacent MW107I
- Necessary updates to the PFAS mass flux / discharge estimates across the northern Site boundary
- If the Site CSM required updating.

The investigation also considered data collected through to December 2022.

The Targeted Groundwater Investigation (AECOM, 2023b) concluded:

- Elevated PFAS impacts detected in MW107I in 2022 were inferred to be a response to increased vertical migration of PFAS from a local soil source mobilised by elevated rainfall over the preceding 12 months and increased head and groundwater elevation within the Clarendon Formation Aquifer (CFA)
- Elevated PFAS impacts in groundwater are present on the northern Site boundary, in a shallow aquitard and at MW124I. However, the aquitard does not appear to have a significant contribution to PFAS mass discharge off-Site
- Estimations of PFAS mass discharge via groundwater over the northern boundary have increased compared to historical estimates. However, surface water is still the largest contributor to PFAS mass discharge off-Site, contributing approximately nine times the mass discharge of groundwater (508 g/year via groundwater compared to 3,667 g/year via surface water)
- Local sources of PFAS contamination in soil are inferred to be present near MW107I and the northern boundary of the Site, including at the FTF.

Based on these conclusions, the following recommendations were made:

- Further monitoring of groundwater wells on the northern boundary be undertaken to monitor for fluctuations in PFAS concentrations and discharge over the northern boundary, especially in response to rainfall

- While the overall contribution to the PFAS mass discharge from groundwater at the northern boundary is minimal in the overall context of the Site, and So Far As Reasonably Practical (SFARP) principles, consideration could be given to localised remediation actions. This may be required given the presence of elevated PFAS impacts on the Site boundary and because of the response of PFAS impacts in MW107I to rainfall and groundwater elevation. There remains the potential for PFAS mass discharge on the northern boundary to increase in response to these environmental factors.

6.1.5 Base Wide RAP

AECOM completed Source Area characterisation works for the remaining potential PFAS Source Areas at the Site in 2022, as identified in the PMAP (Defence, 2019b). This is reported in remediation Data Gap Assessment report (AECOM, 2022e). The characterisation works were undertaken to further refine the spatial extent of soil impacts to support whether remediation is warranted in Source Areas under Defence's objectives of remediation to So Far As Reasonably Practical (SFARP) principles, and for inclusion in the Base Wide RAP (being prepared at the time of the characterisation works).

The works comprised sampling soil, asphalt and surface water for PFAS analysis, and leachability testing of PFAS from soil.

Based on the outcomes of the characterisation works, the following source areas were recommended for inclusion in the Base Wide RAP:

- Source Area 1 – AFCTA: An estimated 282 m3 of PFAS impacted soils containing 2.92 kg of PFOS+PFHxS is present beneath the asphalt. PFAS in the asphalt were also elevated
- Source Area 2 – Area South of the FFTG: An estimated 6,973 m3 of PFAS impacted soils containing 162.7 kg of PFOS+PFHxS is present, and soils in this area have been demonstrated to readily leach
- Source Area 3 – Fire Station Building: An estimated 1,075 m3 of PFAS impacted soils containing 18.1 kg of PFOS+PFHxS, and soils in this area have been demonstrated to readily leach.

The following two Source Areas were not identified as PFAS Source Areas and are not included in future remediation works:

- Source Area 4 – Area used by Fitters. The PFAS impacts appeared to be isolated and showed a low leachable potential. Source Area 5 – Settlement Ponds on Rickabys Drop Zone. The results from the surface water samples collected from inflow and outflow of the settlement ponds did not indicate that they are a secondary source of PFAS impacts to Rickabys Creek.

Additionally, given the outcomes of the Targeted Groundwater Investigation (refer **Section 6.1.4**) PFAS impacts identified on the northern Site boundary in the area of MW107I and the FTF have been included for remediation in the Base Wide RAP.

Other potential source areas identified in the PMAP (including Hangar 54, Fuel Farm 2 and the Tanker Parking Area / Former Fuel Farm), contain critical infrastructure and Defence operations which restrict access for remediation. Remediation at these potential source areas will need to be undertaken opportunistically and will likely be incorporated into Site redevelopment if or when it occurs. In the meantime monitoring under the OMP will continue until redevelopment occurs.

6.2 Infrastructure Projects

The site EMOS contractor informed AECOM that the following infrastructure projects may overlap with known locations of PFAS impacts:

- Base Redevelopment - scheduled for planning commencement 2024
- National Airfield Works Project (P0010) – Schedule for commencement in 2024.

These projects did not fall within the monitoring / reporting period.

6.3 Significant Weather Events

During the monitoring period, the Hawkesbury region experienced a number of significant climatic events, including four significant rain events.

The following records have been obtained from the BoM monitoring station located at RAAF Richmond (067105) via http://www.bom.gov.au/climate/data/:

- The annual total rainfall of 1498 mm for 2022 was higher than the mean annual rainfall of 768.1 mm for this station between 1993 and June 2023
- A significant rain event of 348 mm occurred between 12 and 25 March 2021 that resulted in flooding to the Richmond lowlands and Rickabys Drop Zone
- During November 2021, two significant rain events occurred:
  - 148.6 mm between 4 and 13 November 2021
  - 106 mm between 21 and 28 November 2021.

It is noted that the November 2021 monthly total was the highest for the period between 1994 and 2021.

- During March 2022, two significant rain events occurred that resulted in flooding to the Richmond area:
  - 431.6 mm between 1 and 9 March 2022
  - 136.2 mm between 25 and 31 March 2022.

The monthly total rainfall for March 2022 was 591.2 mm.

Recorded rainfall during the monitoring period totalled 3,033 mm.

The summary of the rainfall recorded over the monitoring period for the weather station at RAAF Richmond (Station ID 067105), and the occurrences of wet weather events (days with rainfall > 15 mm) are provided in **Table 6.** The graph showing monthly rainfall is presented on Graph G1 in **Appendix D**.

Table 6 Rainfall during monitoring period (December 2020 – June 2023)

Sampling Event	Rainfall over the monitoring period from weather station 067105 (BoM, 2021)	Wet weather events during the monitoring period (days with rainfall > 15 mm)
3 to 7 May 2021	• 0.2 mm (3 May 2021) • 0.6 mm (4 May 2021) • 5.6 mm (5 May 2021) • 14.0 mm (6 May 2021) • 29.2 mm (7 May 2021)	• 21.0 mm (22 December 2020) • 23.4 mm (29 December 2020) • 15.0 mm (30 December 2020) • 34.6 mm (2 February 2021) • 18.2 mm (13 February 2021) • 20.4 mm (14 February 2021) • 18.4 mm (14 March 2021) • 65.8 mm (19 March 2021) • 49.4 mm (20 March 2021) • 64.8 mm (21 March 2021) • 66.8 mm (22 March 2021) • 41.0 mm (23 March 2021) • 19.6 mm (8 April 2021) • 29.2 mm (7 May 2021) • 27.2 mm (24 August 2021) • 19.6 mm (25 August 2021) • 19.0 mm (5 November 2021) • 20.6 mm (6 November 2021) • 37.2 mm (8 November 2021) • 23.2 mm (9 November 2021)
22 to 29 November and 14 December 2021	• 23.0 mm (22 November 2021) • 1.6 mm (23 November 2021) • 2.4 mm (24 November 2021) • 6.0 mm (25 November 2021) • 49.4 mm (26 November 2021)	
24 to 31 May and 16 June 2022	• 0.6 mm (24 May 2022) • 0.4 mm (25 May 2022) • 0.2 mm (26 May 2022) • 0.2 mm (28 May 2022) • 0.6 mm (29 May 2022) • 0.2 mm (30 May 2022) • 2.4 mm (31 May 2022)	

Sampling Event	Rainfall over the monitoring period from weather station 067105 (BoM, 2021)	Wet weather events during the monitoring period (days with rainfall > 15 mm)
2 to 25 November and 7 December 2022	• 0.4 mm (4 November 2022) • 0.2 mm (12 November 2022) • 29.0 mm (14 November 2022) • 0.2 mm (15 November 2022) • 0.4 mm (17 November 2022) • 0.1 mm (20 November 2022)	• 20.2 mm (11 November 2021) • 26.8 mm (12 November 2021) • 23.0 mm (22 November 2021) • 49.4 mm (26 November 2021) • 15.8 mm (27 November 2021) • 22.6 mm (6 January 2022) • 26.4 mm (8 January 2022) • 23.2 mm (13 January 2022) • 26.2 mm (19 January 2022) • 17.6 mm (23 February 2022) • 39.8 mm (2 March 2022) • 126.4 mm (3 March 2022) • 25.8 mm (4 March 2022) • 116.4 mm (6 March 2022) • 44.2 mm (7 March 2022) • 40.2 mm (8 March 2022) • 28.8 mm (9 March 2022) • 16.4 mm (19 March 2022) • 17.0 mm (28 March 2022) • 82.2 mm (29 March 2022) • 21.8 mm (7 April 2022) • 31.6 mm (8 April 2022) • 53.4 mm (3 July 2022) • 18.6 mm (4 July 2022) • 88.8 mm (5 July 2022) • 31.0 mm (16 September 2022) • 15.2 mm (28 September 2022) • 23.2 mm (6 October 2022) • 41.4 mm (9 October 2022) • 29.0 mm (14 November 2022) • 14.6 mm (5 January 2023) • 18.4 mm (19 January 2023) • 19.2 mm (30 January 2023) • 32.3 mm (31 January 2023) • 17.0 mm (10 February 2023) • 50.2 mm (22 February 2023) • 41.0 mm (30 April 2023)
8 to 15 May and 9 June 2023	• 0.3 mm (8 May 2023) • 0.7 mm (14 May 2023) • 0.2 mm (15 May 2023) • 0.4 mm (8 May 2023)	

Several wet weather events occurred in the monitoring period (December 2020 to June 2023) including significant falls recorded in March 2021, November 2021, and March 2022. The significant rainfall (double the annual average) and flooding experienced during this monitoring period compared to the monitoring undertaken prior to March 2021, has the potential to impact upon the interpretation of the data, as noted below:

- It is probable that during periods of increased frequency and intensity of rainfall (refer **Table 6** for days where >15 mm of rainfall occurred), PFAS impacted surface soils on-Site becomes saturated for extended periods of time. As a consequence, this leads to greater overland flow into the drains and likely to increase the migration kinetics between solid to liquid partitioning due to the following:
  - a decrease in the air-water interfacial adsorption
  - an increase of the liquid to solid ratio
  - reduced tortuosity impact.

- While surface water concentrations may have become diluted in response to increased rainfall and volume of water within the catchment, the PFAS mass discharged off-Site may have increased due to the mobilisation of PFAS impacts in surface soils and sediments at known Source Areas (refer **Section 6.1.1**) given the mechanisms described above. Note that the dissolved PFAS, while dilute, may discharge in greater quantities due to higher flows.
- The increased rainfall will likely have increased surface water infiltration into the underlying CFA, which in the short-term would have likely decreased concentrations of PFAS in groundwater due to dilution. However, following this short-term response to dilution, concentrations of PFAS in groundwater may increase due to the increased surface water infiltration mobilising PFAS impacts present in impacted soils on-Site in known Source Areas. Particularly in known aquitards present on-Site This response has been observed to occur on-Site as part of the Targeted Groundwater Investigation (refer **Section 6.1.4**)
- The significant flooding that took place in the Richmond lowlands has altered surface water features in this area, including the physical extent of Bakers Lagoon, which now discharges directly to the Hawkesbury River via an unnamed drainage channel to the north. It is not understood whether Bakers Lagoon is receiving surface water flows directly from the Site following the damages (including significant erosion) caused by flooding.

7.0 Monitoring Data Summary

As part of the OMP, as detailed in **Section 1.2** the following five scheduled biannual monitoring events were completed by AECOM over the monitoring period (31 months):

- 3 to 7 May 2021 (May 2021, AECOM, 2021a)
- 22 to 29 November 2021 and 14 December 2021 (November 2021, AECOM, 2022b)
- 24 to 31 May 2022 and 16 June 2022 (May 2022, AECOM, 2022f)
- 2 to 25 November 2022 and 7 December 2022 (November 2022, AECOM, 2023c)
- 8 to 15 May 2023 and 9 June 2023 (May 2023, AECOM, 2023e).

The sample locations are shown on **Figure F4** (**Appendix A**). Results are summarised in following sections and on **Figures F5A** to **F19B** (**Appendix A**). Groundwater elevations shown on **Figures F20** to **F24** (May 2021, November 21, May 2022, November 2022 and May 2023) and interpreted extent of groundwater impact (PFOS+PFHxS) on **Figure F25** (**Appendix A**).

The monitoring and analytical results are provided in **Tables T1** to **T6** in **Appendix C**.

In addition to the OMP data, AECOM also considered the historical data for the Site and Management Areas that are available in the Defence database. **Appendix C**.

7.1 Groundwater Results

7.1.1 Groundwater Field Observations

The field observations during groundwater sampling, including groundwater elevation and parameters, are provided in Table T1 in **Appendix C**.

May 2021

- Groundwater was observed to be clear to brown. Groundwater at three wells were observed to have black suspended solids (MW016, MW080 and MW120). Turbidity ranged from low to high (high turbidity at MW012, MW022, MW026, MW063, MW070, MW071, MW075 and MW097). Other observations of note include:
- Slight hydrogen sulphide odour at MW040 and MW053 and hydrogen sulphide odour at MW043 and MW051
- Sediment in HydraSleeves™ at MW012 and MW076 in May 2021
- Organic suspended solids at MW051 in May 2021.

November 2021

Groundwater was observed to be clear to brown, pale red (MW107D) and dark red (MW008) with generally low to medium turbidity. Other observations of note include:

- Weak hydrocarbon odour noted at MW065
- Weak hydrogen sulphide odour noted at MW121
- Weak to strong organic odours noted at MW021, MW040, MW050 and MW109.

May 2022

Groundwater was observed to be clear to brown. Turbidity ranged from low to high (high turbidity at MW021, MW051, MW097, MW109). Other observations of note include:

- Hydrogen sulphide odour at MW053
- Organic odours at MW008, MW024, MW066, MW072, MW108
- Sediment in base of wells recorded at 25 locations.

November 2022

Groundwater was observed to be clear to brown / orange (MW050) with medium turbidity. Other observations of note include:

Hydrocarbon odour noted at MW064, no sheen

- Sulphurous odour noted at MW040
- Organic odours noted at MW050
- Suspended solids (light brown to brown/orange) present in five locations (MW043, MW050, MW073, MW079, MW081).

May 2023

Groundwater was observed to be clear to light brown, with turbidity ranging from none, low and medium (MW012, MW075, MW143). Other observations of note include:

- No odours, sheen, or suspended solids were observed during this monitoring round.

7.1.2 Groundwater Elevations

The standing water level (SWL) was measured in all the wells to evaluate the groundwater elevations (to m AHD) prior to sampling. Groundwater elevation (GWE) ranges for perched and alluvial groundwater locations from the monitoring events conducted between May 2021 and May 2023 are summarised in **Table 7** (perched) and **Table 8** (alluvial) . It is noted that discontinuous perched groundwater was only observed in MW070 and MW071, located in the central portion of the Site, and it is considered likely to be associated with localised surface water infiltration rather than perched from a geological layer.

Note that due to the increased rainfall received, higher standing water levels were observed, including at the ground surface during sampling events within the Richmond lowlands.

Table 7 Summary of groundwater elevations – perched

Sampling Event	No. Wells	Min. SWL (m btoc)	Max. SWL (m btoc)	Min. GWE (m AHD)	Max. GWE (m AHD)
On-Site Management Area					
May 2021	2	3.730 (MW071)	4.045 (MW070)	15.355 (MW070)	15.420 (MW071)
November 2021	2	3.673 (MW071)	4.107 (MW070)	15.293 (MW070)	15.477 (MW071)
May 2022	2	2.882 (MW071)	3.301 (MW070)	16.099 (MW070)	16.268 (MW071)
November 2022	2	3.210 (MW071)	3.599 (MW070)	15.801 (MW070)	15.940 (MW071)
May 2023	2	3.701 (MW071)	4.074 (MW070)	15.326 (MW070)	15.449 (MW071)

Note: SWL = standing water level, m btoc = metres below top of casing and GWE = Groundwater elevation

Table 8 Summary of groundwater elevations – alluvial

Sampling Event	No. Wells	Min. SWL (m btoc)	Max. SWL (m btoc)	Min. GWE (m AHD)	Max. GWE (m AHD)
On-Site Management Area					
May 2021	59	0.110 (MW012)	17.355 (MW054)	-1.365 (MW072)	10.888 (MW043)
November 2021	70	0.123 (MW013)	17.676 (MW054)	-1.551 (MW072)	18.735 (MW119)
May 2022	65	0.020 (MW013)	16.501 (MW054)	0.090 (MW072)	9.494 (MW010)
November 2022	67	0.027 (MW012)	16.652 (MW054)	-0.054 (MW072)	9.760 (MW010)
May 2023	66	0.512 (MW013)	17.252 (MW054)	-1.106 (MW072)	9.323 (MW107D)
Off-Site Management Area, and areas outside the Management Area					
May 2021	15	0.555 (MW098)	14.872 (MW080)	4.228 (MW092)	9.218 (MW075)
November 2021	14	0.000 (MW081)	15.050 (MW080)	3.080 (MW092)	9.261 (MW075)
May 2022	12	0.000 (MW081)	13.486 (MW106)	4.560 (MW092)	10.432 (MW075)
November 2022	11	0.000 (MW081)	13.774 (MW080)	4.455 (MW092)	10.667 (MW075)
May 2023	15	0.264 (MW081)	14.380 (MW080)	2.882 (MW092)	10.573 (MW075)

Note: SWL = Standing Water level, GWE = Groundwater Elevation, m AHD = metres Australian Height datum, m btoc = metres below top of casing, Min = Minimum, Max = Maximum

Groundwater elevations in the perched groundwater were generally the same throughout the monitoring period. Groundwater elevations within alluvial aquifers, particularly within the on-Site Management Area were highest during the November 2021 biannual event. There were a number of locations where new maximum SWLs were reported, remaining locations were within historical ranges.

Groundwater depths in 2019 and 2020 and in some cases in July 2017 (DSI, AECOM 2018a) were reported to be lower than most events during the current monitoring period, which can be attributed to the historically drier conditions observed on the Site during the collection of the historic gauging data, in comparison to higher rainfall conditions observed since February 2020.

7.1.3 Groundwater Flow Direction

Based on the SWL and survey data, the interpreted groundwater level contours for groundwater within the alluvial aquifer for each of the five biannual events completed during the monitoring period are presented in **Figure F20** (May 2021) to **Figure F24** (May 2023) in **Appendix A**.

Any exclusions to the contours are noted on the figures, the majority of which were associated with the removal of gauging data from monitoring wells screened across the perched water zone. This is to ensure the representativeness of the regional (alluvial) groundwater flow conditions. These exclusions and refinements were made due to gaps in data for the specific locations but overall, due to the broader data set, are not expected to impact the inferred groundwater flow outputs.

The data from the monitoring period indicates that groundwater on the Site, forming part of the Clarendon Formation Aquifer (CFA) and Lowlands Formation Aquifer (LFA) generally present an inferred flow to the north, then east towards tributaries of Rickabys Creek, Bakers Lagoon and Hawkesbury River. The flow directions are generally consistent with those measured in the DSI (AECOM, 2018a) and the 2020 AIR (AECOM, 2021d).

7.1.4 Groundwater Quality Parameters

Groundwater quality parameters were measured prior to collecting groundwater samples and are presented in **Table T1** in **Appendix C** and summarised below in **Table 9** (perched) and **Table 10** (alluvial).

Table 9 Summary of groundwater quality parameters – perched

Sampling Event	Number of samples	Dissolved Oxygen (mg/L)		Electrical Conductivity (µS/cm)		pH		Correct redox (mV)		Temperature	
	Count	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
On-Site Management Area

November 2022	11	0.79 (MW092)	4.16 (MW079)	163.9 (MW091)	1466.0 (MW081)	5.68 (MW091)	6.98 (MW032)	189.5 (MW092)	441.3 (MW081)	20.3 (MW042)	27.3 (MW078)
May 2023	15	0.04 (MW143)	2.57 (MW081)	187.9 (MW091)	4615.0 (MW144)	5.76 (MW092)	6.89 (MW144)	171.3 (MW082)	482.7 (MW143)	16.9 (MW016)	20.4 (MW143)

Note:

[1] December 2021 resampling event included.

The readings presented in **Table 9** and **Table 10** indicate:

- Generally oxygenated conditions, with highest DO readings observed in May 2021 and November 2022
- Fresh to saline groundwater conditions. Highest EC conditions (over 10,000 µS/cm, representative of relatively saline water conditions) were recorded in on-Site wells (MW005, MW062). The lowest EC conditions (below 200 µS/cm, representative of relatively fresh water conditions) were recorded in both on-Site and Site boundary wells (MW005, MW015, MW022, MW025, MW033, MW040, MW041, MW043, MW048, MW050, MW070, MW071 and MW072) as well as off-Site wells (MW091 and MW092).
- Acidic to neutral conditions, with slightly alkaline conditions present
- Oxidising conditions
- Temperature ranges are considered consistent with background conditions for the time of year of the sampling being conducted in each event.

7.1.5 PFAS Groundwater Analytical Results

Historical groundwater analytical results are presented in **Table T4** in **Appendix C** and monitoring activities are summarised in the OMP Sampling Event Factual Reports provided in **Appendix B**.

Groundwater sample results from May 2021, November 2021, May 2022, November 2022, and May 2023 are presented spatially on **Figures F5A** to **Figure F9B** in **Appendix A.**

The interpretive assessment of these results are discussed in **Section 8.2**.

A summary of analytical results from the OMP works is provided in **Table 11** (both on-Site Management Area and off-Site Management Area).

Deviations from the historical dataset for groundwater are summarised in **Table 12**, below and graphically on the temporal trend **Graph G4** to **G14** in **Appendix D**.

Table 11 Summary of PFOA, PFOS and PFOS+PFHxS Concentrations in Groundwater

Sampling Event	No. of Samples[1]	Compound	Concentration Range (µg/l) in Sampling Event	No. of Samples[1] with Concentration > LOR	No. of Exceedances of Human Health Criteria	No. of Exceedances of Ecological Criteria

7.1.6 Groundwater Geochemistry

Selected groundwater samples were also analysed for geochemical parameters during the monitoring period. These are presented on **Table T4** (in **Appendix C**) and the Piper Plots are presented as **Graph G2** and **Graph G3** in **Appendix D**.

Major ion composition was previously assessed in groundwater and surface water samples to assess groundwater flow paths (AECOM, 2018a and AECOM, 2021d). During this monitoring period (i.e. November 2021 and November 2022), major ion data was also reported in selected groundwater and surface water samples, which is presented as Piper Plots in **Appendix D**.

In general, major ion results for November 2021 and November 2022 displayed similar trends to AECOM (2018a) and AECOM (2021b), as summarised below:

- The cation composition is dominated by sodium chloride, indicating saline conditions and the trend in the lower left triangular diagram indicates saline water is interacting with fresh water. This is likely a result from a combination of mechanisms including the influence of the salt wedge emanating from the Hawkesbury River mixing with fresher groundwater discharging from the CFA to the low lands, and surface water infiltration following rainfall mixing with groundwater
- Samples collected from locations within the LFA and CFA show relatively equivalent calcium and sodium concentrations, as well as chloride concentrations indicating that the aquifers are likely to be connected.

The general observations from major ions in samples collected during the AECOM (2018a), AECOM (2021b) and the November 2021 and November 2022 monitoring event are consistent with the conceptual understanding and modelled groundwater flow where freshwater infiltration mixes with more saline groundwater and flows to the northeast.

7.2 Surface Water Results

7.2.1 Surface Water Field Observation

Organic odours were noted at four surface water locations (SW013, SW016, SW018, SW037) during the monitoring period. Foam was observed at the following three surface water locations during the monitoring period:

- SW001 on 7 May 2021
- SW002 on 5 May 2021
- SW024 on 3 November 2022.

7.2.2 Surface Water Quality Parameters

Surface water quality parameters were measured prior to collecting surface water samples and are presented in **Table T2** in **Appendix C** and summarised below in **Table 13**.

Table 13 Summary of surface water quality parameters

Gauging Event	Dissolved Oxygen (mg/L)		Electrical Conductivity (µS/cm)		pH		Correct redox (mV)		Temperature	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
On-Site management area										
May 2021	1.23 (SW008)	9.23 (SW037)	54.6 (SW011)	1355.0 (SW007)	5.68 (SW014)	9.02 (SW037)	178.4 (SW037)	416.7 (SW002)	15.3 (SW005)	20.4 (SW003)
November 2021	0.00 (SW037)	6.61 (SW001)	59.3 (SW001)	1642.0 (SW005)	5.70 (SW014)	7.62 (SW005)	34.2 (SW037)	373.9 (SW001)	18.3 (SW007)	22.1 (SW001)
May 2022	0.60 (SW014)	10.38 (SW013)	147.0 (SW014)	1504.0 (SW007)	6.78 (SW009)	8.07 (SW011)	216.5 (SW014)	341.2 (SW013)	13.5 (SW019)	21.7 (SW001)

Off-Site management area and off Site locations										
May 2021	0.65 (SW016)	8.64 (SW030)	140.2 (SW022)	1789.0 (SW018)	5.68 (SW014)	7.47 (SW032)	244.3 (SW035)	320.0 (SW014)	15.8 (SW009)	20.4 (SW003)
November 2021	0.32 (SW016)	9.46 (SW030)	6.6 (SW020)	781.0 (SW032)	6.47 (SW003)	7.68 (SW035)	216.1 (SW015)	359.1 (SW024)	16.7 (SW030)	28.9 (SW032)
May 2022	2.20 (SW022)	6.70 (SW024)	118.2 (SW024)	1559.0 (SW015)	6.93 (SW020)	7.45 (SW035)	279.1 (SW015)	371.8 (SW023)	11.8 (SW023)	16.7 (SW030)
November 2022	1.38 (SW019)	12.44 (SW035)	134.4 (SW030)	1880.0 (SW015)	6.62 (SW019)	8.37 (SW020)	241.9 (SW019)	366.3 (SW035)	22.2 (SW022)	27.3 (SW015)
May 2023	2.30 (SW015)	9.06 (SW035)	204.2 (SW016)	1211.0 (SW015)	6.15 (SW016)	7.61 (SW015)	208.4 (SW015)	357.1 (SW015)	2.6 (SW016)	19.4 (SW035)

The readings presented in **Table 13** indicate:

- Generally oxygenated conditions
- Generally fresh, with some brackish water conditions (over 1,500 µS/cm) noted in both on-Site and off-Site locations
- Acidic to alkaline conditions. Note that the elevated pH (9.02 in May 2021) reported at SW037 is consistent with historical pH measurements at this location, which is likely to be attributed to the STP facility
- Oxidised conditions
- Temperature ranges are considered consistent with background conditions for the time of year of the sampling being conducted in each event.

7.2.3 PFAS Surface Water Analytical Results

Historical surface water analytical results are presented in **Table T5** in **Appendix C** and monitoring activities are summarised in the OMP Factual Reports provided in **Appendix B**. A summary of analytical results are provided in **Table 14** below.

Note that surface water sample results for all sampling events within the monitoring period are presented in **Figure F10A** to **Figure F14B**, **Appendix A,** and are further discussed in **Section 8.6**.

Deviations from the historical dataset are provided in **Table 15** below. Temporal trend graphs for surface water are presented in **Graphs G15** to **G24** in **Appendix D** and discussed in **Section 8.4**.

Table 14 Summary of PFOA, PFOS and PFOS+PFHxS Concentrations in Surface Water

Sampling Event	No. of Samples[1]	Compound	Concentration Range (µg/l) in Sampling Event	No. of Samples[1] with Concentration > LOR	No. of Exceedances of Human Health Criteria	No. of Exceedances of Ecological Criteria

7.2.4 Surface Water Geochemistry

Selected surface water samples were also analysed for the geochemical parameters during the monitoring period. These are presented on **Table T5** (in **Appendix C**) and on Piper Plots **Graph G2** and **Graph G3** in **Appendix D**.

Major ion composition was previously assessed in groundwater and surface water to assess groundwater flow paths (AECOM, 2018a and AECOM, 2021d).

In general, the major ions reported in November 2021 and November 2022 were similar to those previously reported (AECOM, 2018a and AECOM, 2021d).

The data for surface water locations selected on-Site and in up-stream water bodies were primarily indicative of freshwater conditions whilst those in the receiving surface water environments of Rickabys Creek and/or other Hawkesbury River tributaries reported composition indicative of saline conditions.

7.3 Sediment Results

7.3.1 Sediment Field Observations

The sediment observations during the monitoring period generally comprised sandy silt, sand, silty clay or silt which were light brown to dark brown or light grey to grey, and generally included organic matter in the form of rootlets and/or algae and/or leaves.

7.3.2 Sediment Analytical Results

Sediment samples were co-located and collected with surface water samples. Analytical results are presented spatially on **Figure F15A** to **Figure F19B** – **Appendix A**. Historical sediment analytical results are presented in **Table T6** in **Appendix C** and monitoring activities are summarised in the OMP Factual Reports provided in **Appendix B**.

A summary of analytical results is provided in **Table 16** and in **Table 17** below.

Deviations from the historical dataset for sediment are provided in **Table 17** below and graphically on the temporal trend Graphs G25 to G30 in **Appendix D**. Further discussion on the data trends for each Source Area are outlined in **Section 8.0** below.

Table 16 Sediment analytical results summary

Sampling Event	No. of Samples[1]	Compound	Concentration Range (µg/l) in Sampling Event	No. of Samples[1] with Concentration > LOR
On-Site Management Area				
May 2021	9	PFOA	0.0006 µg/l (SD013) to 0.0493 µg/l (SD001)	6
		PFOS	0.0012 µg/l (SD007) to 2.78 µg/l (SD001)	9

8.0 Interpretive Analysis

8.1 Hydrogeology

The SWLs were measured in the groundwater monitoring wells to evaluate the groundwater elevations (m AHD). Depth to groundwater measurements collected during the current monitoring period and historical data are presented in **Table T3** (in **Appendix C**) and the inferred groundwater level contours are presented on **Figure F20** (May 2021) to **Figure F24** (May 2023) (**Appendix A**). Groundwater elevations in the perched and alluvial aquifers in May 2022 and November 2022 were generally higher than groundwater elevations reported in 2021 and 2023, following significant rainfall events where up to six times the respective monthly rainfall averages were recorded, resulting in widespread flooding events across the broader Hawkesbury River Catchment Area (discussed in **Section 6.3**). There were a number of locations where new maximum SWLs were reported, remaining locations were within historical ranges.

Groundwater depths in 2019 and 2020 and in some cases in July 2017 (DSI, AECOM 2018a) were reported to be lower than more recent events, which can be attributed to the historically drier conditions observed on the Site during these times, in comparison to higher rainfall conditions observed since February 2020.

8.2 Groundwater Results

8.2.1 Overview

The May 2021, November 2021, May 2022, November 2022, and May 2023 groundwater results for PFOS+PFHxS and PFOA compared to assessment criteria are provided in **Figures F5** to **Figure F9** in **Appendix A** and presented in **Table T4** in **Appendix C**.

A summary of changes to the nature and extent of PFAS groundwater contamination is discussed below.

8.2.2 PFAS Plume Characteristics

The current PFAS plume is presented on **Figure F25** (**Appendix A**).

The groundwater PFAS plume extents are generally consistent with the plume presented in the 2020 AIR, with the exception of the following changes identified during this monitoring period:

- Decreasing PFAS concentrations in groundwater at MW040 located in the FFTG following the completion of soil remediation works (refer **Section 6.1.3**)
- Higher PFAS concentrations detected on the northern boundary of the Site at MW107I. These increases were inferred to be in response to high rainfall mobilising PFAS from soil at this location. Therefore, remediation activities are planned for this area which are scheduled to commence in late 2023 to ensure this PFAS does not leave the Site boundary
- MW143 and MW144 were installed to replace MW098 and MW099 which were destroyed during flooding events in March 2021. The new wells were installed along Cupitts Lane south of Cooley Creek within the same hydrogeological unit as the destroyed wells. MW143 and MW144 were sampled for the first time in May 2023, reporting PFAS concentrations an order of magnitude higher than was previously reported at MW098 and MW099. The surface water concentrations nearby these wells were similar, and it is possible the PFAS detects in groundwater are likely to be a result of surface water transport during the flood events. The concentrations here will be monitored for changes at the next sampling event.
- Increasing PFAS concentrations in on-Site well, MW051 in the area used by Fitters, within the alluvial aquifer. This impact was considered to be localised and unlikely to be migrating due to the decreasing PFAS concentrations in down hydraulic gradient wells.

The Site and Management Areas experienced prolonged periods of elevated rainfall throughout the monitoring period, which has influenced the extent and fluctuations in concentrations of PFAS in groundwater.

Based on the concentrations of PFAS in groundwater, there is no significant change to the risk to human health and the environment. The frequency and locations of sampling remains sufficient. With closer evaluation of the groundwater characteristics associated with this Source Area to be ongoing.

8.3 Groundwater PFAS Temporal Trends

8.3.1 Overview

Temporal graphs and Mann-Kendal analysis are presented in **Appendix D** and **Appendix E**, respectively, for PFOS+PFHxS and PFOA concentrations in groundwater at the following selected locations indicative of areas of interest within the On-Site and Off-Site Management Areas:

- FFTG, Area South of the FFTG and western airfield: 6 monitoring wells
- Fire Station Building and Hanger 54: 5 monitoring wells
- Eastern airfield boundary: 4 monitoring wells
- Northern Site boundary adjacent FTF and AFCTA: 8 monitoring wells
- Site Boundary with Rickabys Creek: 3 monitoring wells
- STP and Off-Site: Bakers Lagoon: 7 monitoring wells.

A summary of historical groundwater concentrations of PFOA and PFOS+PFHxS are displayed graphically on temporal trend graphs for the PFAS source areas outlined in **Table 18** below.

Table 18 Temporal groundwater trend graphs for source areas

Graph ID	Area	Groundwater Locations
G4, G5	FFTG, Area South of the FFTG and western airfield	MW008, MW009, MW010, MW040, MW041, MW079
G6, G7	Fire Station Building and Hanger 54	MW024, MW025, MW028, MW062, MW063
G8, G9	Eastern airfield boundary	MW047, MW050, MW051, MW052
G10, G11	Northern Site boundary adjacent FTF and AFCTA	MW030, MW053, MW054, MW57, MW058, MW107I, MW107D, MW108
G12	Site Boundary with Rickabys Creek	MW001, MW095, MW114
G13	STP and Off-Site: Bakers Lagoon	MW021, MW022, MW109
G14	STP and Off-Site: Bakers Lagoon	MW021, MW022, MW023, MW097, MW098, MW109, MW110

The Mann Kendal analysis was used to assess the trends in the concentrations in both groundwater and surface water and whether they have a monotonic upward or downward trend. The significance of these trends is determined by the confidence factor, or *p* value, of the analysis, as follows.

- a confidence factor over 95% indicates that there is an increasing or decreasing trend
- a confidence factor over 90% indicates the there is a ‘probably increasing’ or ‘probably decreasing’ trend
- a confidence factor less than 90% indicates ‘Stable’ or ‘No Change’.

Trend analysis was only undertaken for locations which were sampled in the current monitoring period and for locations which were consistently greater than the LOR. Where sample results were less than the LOR, half the LOR was adopted for the Mann-Kendal analysis..

A summary of PFOS+PFHxS and PFOA concentrations for the select locations (including historical ranges and concentrations from the OMP events during the monitoring period) and trend analysis results are presented in tabular form in the following sections.

8.3.2 FFTG, Area South of the FFTG and western airfield

The changes in PFOS+PFHxS and PFOA concentrations in MW040 at the FFTG show a clear decreasing trend, as evident in the results of the Mann-Kendal assessment (refer to **Table 22**) and temporal graph (**Appendix D**). PFOS+PFHxS and PFOA concentrations in MW040 have steadily declined following the completion of soil remediation works at the FFTG (refer **Section 6.1.3**). This would infer that the soil remediation works have been successful in reducing the vertical migration of PFAS to groundwater however, further performance monitoring is required to confirm that remediation goals have been met.

The changes in PFOS+PFHxS and PFOA concentrations in wells in the western airfield demonstrate a general stable trend or no trend, with the exception of MW079 located on the Site boundary, cross-hydraulic gradient from the FFTG, which is displaying an increasing trend in the Mann Kendal analysis (**Table 19**). While the Mann-Kendal results indicate an increasing trend, further monitoring is required to confirm whether this trend is representative of increasing concentrations.

Table 19 FFTG, Area South of the FFTG and western airfield

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW008	PFOS+PFHxS	0.16 -0.3	0.28 – 0.83	*Increasing*	96.2%
MW009	PFOS+PFHxS	0.16	0.08 – 0.18	Stable	76.5%
MW010	PFOS+PFHxS	0.53 – 11.0	0.25 – 10.3	No trend	69.4%
	PFOA	<LOR – 0.21	<LOR – 0.32	No trend	65.7%
MW040	PFOS+PFHxS	190 - 969	72.5 - 199	Decreasing	>99.9%
	PFOA	2.09 – 9.8	0.59 – 3.98	Decreasing	98.6%
MW041	PFOS+PFHxS	0.17 – 0.29	0.05 – 0.16	Decreasing	99.7%
MW079	PFOS+PFHxS	0.69 – 1.09	0.9 – 3.14	Increasing	99.9%
	PFOA	0.01 – 0.04	0.02 – 0.06	No Trend	79.2%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.3.3 Fire Station Building and Hanger 54

The changes in PFOS+PFHxS and PFOA concentrations in wells at the Fire Station Building and Hanger 54 continue to show a generally steady trend, this is with the exception of PFOS+PFHxS concentrations in MW028 where changes in concentration are presenting a ‘probably increasing’ trend (refer to **Table 20**). MW028 is located downgradient of the Fire Station Building and Hanger 54 but it’s connectivity to these areas is not clear, as concentrations in MW028 are elevated above the monitoring wells located in these two areas. Further monitoring is required to confirm this trend.

Table 20 Fire Station Building and Hanger 54

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW024	PFOS+PFHxS	0.04 – 1.33	0.34 – 0.55	*Probably increasing*	92.55%
MW025	PFOS+PFHxS	0.04 – 0.08	0.03 – 0.15	No trend	65.7%
MW028	PFOS+PFHxS	0.34 – 9.5	4.43 – 16.6	Probably increasing	94.0%
	PFOA	0.04 – 0.1	0.07 – 0.24	*Increasing*	96.2%

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW062	PFOS+PFHxS	0.48 – 0.95	0.40 – 0.81	Stable	76.2%
MW063	PFOS+PFHxS	8.99 – 21.5	1.28 – 15.6	Stable	54.0%
	PFOA	0.39 – 1.08	0.05 – 0.95	Stable	69.4%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.3.4 Eastern airfield boundary

The changes in PFOS+PFHxS and PFOA concentrations in wells at the Eastern airfield boundary present a 'decreasing' trend in monitoring wells MW047 and MW052 (refer to **Table 21**). However, MW051 presented an 'increasing trend', with a historical maximum of 1,780 µg/L PFOS+PFHxS detected in this monitoring round.

While all four wells are located on the boundary, MW051 is located at the low point of the boundary and near the primary stormwater drainpipe that discharges to Rickabys Creek at SW009. Given that no local PFAS source has been identified (AECOM, 2022e), it is inferred that the impacts in MW051 are a result of surface water infiltration from the drainpipe. Additionally, the increase in concentrations coincide with the period of above average rainfall which occurred during this monitoring period (refer **Section 6.3**).

Table 21 Eastern airfield boundary

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW047	PFOS+PFHxS	11.2 – 22.6	1.11 – 14.0	Decreasing	99.7%
	PFOA	0.34 – 0.6	0.02 – 0.38	*Decreasing*	99.7%
MW050	PFOS+PFHxS	8.04 – 31.0	6.26 – 37.8	Stable	54.0%
	PFOA	0.25 – 0.9	0.13 – 0.99	Stable	69.4%
MW051	PFOS+PFHxS	51.4 – 473	333 – 1780	Increasing	97.7%
	PFOA	0.87 – 18.8	11.2 – 65.3	Increasing	98.6%
MW052	PFOS+PFHxS	24.1 – 43.0	1.53 – 22.1	Decreasing	99.4%
	PFOA	0.3 – 0.44	0.03 – 0.36	*Decreasing*	99.4%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.3.5 Northern Site boundary adjacent FTF and AFCTA

The changes in PFOS+PFHxS and PFOA concentrations in wells on the northern boundary adjacent to the FTF and AFCTA present a general steady trend (refer to **Table 22**). The exception to this is PFOS+PFHxS and PFOA in MW107I and PFOS+PFHxS in MW053 which presented a 'probable increasing trend'. This trend was assessed in the Targeted Groundwater Investigation (AECOM, 2023b), where it was inferred that this probable increasing trend was a result of increased vertical migration of a local PFAS source in response to a period of increased rainfall.

Table 22 Northern Site boundary adjacent FTF and AFCTA

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW030	PFOS+PFHxS	3.12 – 5.03	1.03 – 5.00	Decreasing	97.7%
	PFOA	<LOR – 0.2	0.05 – 0.3	Stable	53.0%
MW053	PFOS+PFHxS	0.12 – 0.93	0.2 – 15.4	Probably Increasing	91.0%
	PFOA	<LOR – 0.09	0.04 – 0.56	*Increasing*	98.8%
MW054	PFOS+PFHxS	0.09 – 0.31	0.17 – 0.42	*Increasing*	99.4%
MW57	PFOS+PFHxS	0.78 – 1.03	0.75 – 1.33	Stable	46.0%
	PFOA	<LOR – 0.06	0.05 – 0.08	*Increasing*	99.7%
MW058	PFOS+PFHxS	1.86 – 9.34	2.36 – 11.7	No trend	69.4%
	PFOA	<LOR – 0.9	0.3 – 0.65	*Increasing*	96.4%
MW107I	PFOS+PFHxS	5.0 – 11.5	9.72 – 1,100	Probably increasing	91.0%
	PFOA	0.19 – 1.24	0.77 - 95	Probably increasing	91.0%
MW107D	PFOS+PFHxS	1.41 – 2.11	4.59 – 21.7	No trend	76.5%
	PFOA	0.06 – 0.07	0.16 – 2.07	No trend	86.4%
MW108	PFOS+PFHxS	0.37 – 0.83	0.48 – 1.5	Stable	50.0%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.3.6 Site Boundary with Rickabys Creek

The changes in PFOS+PFHxS and PFOA concentrations in wells at the Site boundary with Rickabys Creek present a general steady trend (refer to **Table 23**).

Table 23 Site Boundary with Rickabys Creek

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW001	PFOS+PFHxS	0.1 – 0.13	0.1 – 0.14	Stable	58.0%
MW095	PFOS+PFHxS	0.07 – 0.18	0.09 – 0.12	Stable	39.3%
MW114	PFOS+PFHxS	0.06 – 0.15	0.1 – 0.17	No trend	81.5%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.3.7 STP and Off-Site: Bakers Lagoon

The changes in PFOS+PFHxS and PFOA concentrations in wells at the STP and off-Site near Bakers Lagoon show a generally stable to decreasing trend, with the exception of MW109, which is showing a 'probable increasing trend' (refer to **Table 24**).

Table 24 STP and Off-Site: Bakers Lagoon

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW021	PFOS+PFHxS	9.74 – 15.2	4.33 – 7.02	Probably Decreasing	91.0%
	PFOA	0.42 – 0.55	0.21 – 0.4	*Probably Decreasing*	91.0%
MW022	PFOS+PFHxS	7.05 – 40.0	3.63 – 22.1	Probably Decreasing	91.0%
	PFOA	0.1 – 1.1	0.06 – 0.69	Stable	87.0%
MW023	PFOS+PFHxS	0.05 – 0.66	0.07 – 0.27	Stable	72.8%
MW097	PFOS+PFHxS	<LOR	<LOR – 0.01	No trend	76.4%
MW098	PFOS+PFHxS	<LOR	<LOR – 0.01	No trend	76.4%
MW109	PFOS+PFHxS	2.37 – 3.1	5.11 – 6.41	Probably Increasing	93.2%
	PFOA	0.07 – 0.09	0.12 – 0.2	No trend	86.4%
MW110	PFOS+PFHxS	0.36 – 0.55	2.11 – 2.46	No trend	50.0%

n/s = not sampled

italics indicate low confidence in the Mann-Kendal trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR

8.4 Surface Water Results

The surface water results from the monitoring period for PFOS+PFHxS and PFOA were compared to assessment criteria and are provided in **Figures F10 to Figure F14** (**Appendix A**. Mann-Kendall statistical analysis was not undertaken for surface water locations due to the variable nature of the results being unsuitable for making monotonic trend assessments.

A summary of changes to the nature and extent of surface water contamination is provided below.

8.4.1 On-Site Management Area

Concentrations of PFAS within on-Site monitoring locations remained generally within historical ranges throughout the monitoring period.

8.4.2 Off-Site Management Area and Areas outside Management Area

Concentrations of PFAS in surface water were generally within historical ranges, with increases reported following elevated rainfall periods in 2021 and 2022.

It is noted that the PFAS concentrations in off-Site monitoring locations remain an order of magnitude below on-Site concentrations.

8.4.3 Summary of Surface Water Results

The nature and extent of the PFAS impacts in surface water were generally similar to the 2020 AIR with the exception of some localised increases particularly in the vicinity of known source areas, with highest concentrations reported in on-Site locations at SW001 and SW002. Off-Site surface water PFAS impacts have been noted to increase during the current monitoring period, particularly following recent prolonged periods of elevated rainfall. This may be also attributable for the reported PFAS concentrations in off-Site groundwater as described above.

There were first-time detects (for PFOA) and new maximum (for PFOS+PFHxS) reported at SW018 located down-gradient of SW009 in Rickabys Creek, where the creek discharges to the Hawkesbury River. The location further down gradient of SW018 is SW030 located in the Hawkesbury River which reported lower concentrations of PFOS+PFHxS. New maximum PFOS+PFHxS concentrations were

also reported at SW005 and SW037, located within the on-Site Management Area. These changes in surface water contamination distribution are likely to be attributed to a number of factors including increased PFAS discharge from the Site resulting from increased rainfall observed, tidal fluctuations in the Hawkesbury River, mobilization of PFAS from up gradient sources and increased surface water volumes within the wider Hawkesbury River catchment. However, as discussed in **Section 6.1.4** and **Section 6.3**, the increase in PFAS concentrations observed in SW018 are likely in response to increased PFAS discharge from the Site.

Based on the concentrations of PFAS in surface water there is no significant change to the risk to human health and the environment. The frequency and locations of sampling remains sufficient.

8.5 PFAS Temporal Trend - Surface Water

Temporal trend graphs were created (using the Defence [2022] PFAS OMP AIR Guidance) for PFOS+PFHxS and PFOA concentrations in surface water associated with the Management Areas.

A summary of temporal data trend graphs by area are presented in **Table 25** below. These graphs are presented in **Appendix D**.

Table 25 Temporal surface water trend graphs by area

Graph ID	Area	Surface Water Locations
G15, G17	North of the Site (on-Site)	SW001, SW002, SW003, SW037
G16, G18	North of the Site (off-Site)	SW015, SW016
G19, G21	East of the Site (on-Site)	SW005, SW007, SW008, SW009, SW011, SW013, SW014
G20, G22	East of the Site (off-Site)	SW018, SW019, SW020, SW023, SW030, SW032
G23, G24	West of the Site (On-Site and off-Site)	SW022, SW024, SW035

* SW020, SW024, SW030, SW035 are located outside the off-Site Management Area

A summary of surface water PFOS+PFHxS and PFOA concentrations for the select locations (including historical ranges and concentrations from the OMP events during the monitoring period) are discussed through temporal trend reviews based on the different regions within the three Management Areas in the following sub-sections.

Note that Mann-Kendall analysis was not used to assess the trends in PFAS concentrations in surface water, given that variables such as rainfall, which influence PFAS concentrations are not factored into the analysis.

Temporal trend analysis was undertaken for locations which were sampled in the current monitoring period. Locations with PFAS concentrations consistently below LOR were excluded. Wet weather sampling event data (AECOM, 2021b, 2022a, 2022c and 2022d) was included in the temporal figures. This is distinguishable on the graphs by multiple analytical results (often also presenting significant changes to concentrations) for a given location within a short time frame. The locations with wet weather sampling event data are SW002, SW009 and SW016.

Additionally, the 30-day average daily rainfall total (in mm) has been included on the temporal trend graphs to allow for assessment of the influence of rainfall on the recorded surface water contamination levels.

8.5.1 Temporal Trend – North of the Site

The PFOS+PFHxS and PFOA concentrations in surface water within the on-Site Management Area in the north of the Site generally remained within historic ranges (refer to temporal trend **Graphs G15** to **G18** in **Appendix D**).

An increase in PFAS concentrations in surface water were reported in the sampling events completed following the March 2022 rainfall period, which is consistent with the CSM regarding the mobilisation of PFAS following significant rainfall events as discussed in **Section 6.1.1** and **Section 6.3**. Note that the

concentrations of PFOS+PFHxS in off-Site monitoring location SW016 increased by approximately two orders of magnitude from 0.1 µg/l to 1.0 µg/l in the period immediately following the rainfall.

These concentration increases were investigated further as part of the multi-event mass flux studies (AECOM, 2021b, 2022a, 2022c and 2022d) to assess PFAS mass discharge estimates.

8.5.2 Temporal Trend – East of the Site

The PFOS+PFHxS and PFOA concentrations in surface water on the east of the Site remained generally within historic ranges during the monitoring period. Note that an increase in concentrations were reported following the rainfall events in 2021 and 2022, which brought PFAS concentrations up to the same order of magnitude as those reported in 2017.

Additionally, an increase in PFAS concentrations were also reported in off-Site locations following rainfall events in 2021 and 2022, resulting in a number of new maximums in PFAS concentrations reported to the east of the Site, at monitoring locations SW018, SW020, SW023 and SW030. Given the outcomes of the mass flux study (refer **Section 6.1.1**), and as a result of the mechanisms described in **Section 6.3**, the increases in PFAS concentration observed at SW023 and SW018 in Rickabys Creek are likely to be attributed to increased PFAS discharge from the area of SW009 during the significant preceding rainfall events (refer **Table 6**). AECOM considers that, conceptually, this response would be anticipated given the nature of PFAS in general and the Site. Note that the PFAS concentrations at these locations retuned to baseline concentrations following these isolated increases in response to significant rainfall.

Additionally, monitoring locations SW019 and SW020 located in Rickabys Creek upgradient of the Site displayed a similar response to significant rainfall events, with PFAS concentrations increasing in response to these events. This indicates that the observed response of increasing PFAS concentrations following significant rainfall events occurs region wide. Additionally, it demonstrates that upgradient PFAS sources are contributing to PFAS impacts observed in Rickabys Creek.

Note that off-Site PFAS concentrations in surface water remain generally an order of magnitude lower than on-Site.

Refer to temporal trend **Graphs G19** to **G22** in **Appendix D**.

8.5.3 Temporal Trend – West of the Site

Surface water west of the Site was characterised by three off-Site sampling locations, SW022, SW024 and SW035. At these locations PFOA concentrations remained at or near the LOR during the monitoring period.

An increase in PFOS+PFHxS concentrations were reported following both the 2021 and 2022 rainfall periods (refer to temporal trend **Graphs G23** and **G24** in **Appendix D**). This response is similar to that discussed in **Section 8.5.2**, where upgradient monitoring locations experienced an increase in PFAS concentrations in response to significant rainfall events prior to the May 2021 and May 2022 sampling events. This indicates that the significant rainfall events likely to have mobilised PFAS contamination from PFAS source areas upgradient of the Site. Note that these concentrations are similar to PFOS+PFHxS concentrations observed to the north and west of the Site.

8.6 Sediment Results

The sediment results for the monitoring period for PFOS+PFHxS and PFOA are presented spatially on **Figures F15 to Figure F19** in **Appendix A**.

A summary of changes to the nature and extent of sediment contamination is provided in the sub-sections below.

8.6.1 Analytical Results

- First-time detections were reported at four locations throughout the monitoring period (SD016, SD019, SD020, SD024)
    - SD019 and SD020 are located along Rickabys Creek off-Site south of the Site
    - SD016 located off-Site north of the Site, towards Bakers Lagoon

  - SD024 located along the Hawkesbury River off-Site northwest of the Site.

- No first-time detections were reported following the May 2022 sampling event as all sampled locations reported concentrations above LOR for key PFAS compounds PFOA and PFOS+PFHxS, which were within the historic sampling data set
- 13 of 16 sediment sampling locations reported new historic maximum concentrations of PFAS during the monitoring period. Notable increases include:
  - PFOS+PFHxS at SD022 detected at 0.01 mg/kg in November 2022 and 0.005 mg/kg in November 2021 (previous maximum of 0.003 mg/kg in May 2020)
  - PFOA at SD014 detected at 0.008 mg/kg in May 2021, an order of magnitude above the previous maximum in July 2017
  - PFOS+PFHxS at SD020 detected at 0.006 mg/kg in May 2021, previously <LOR.
- 12 of 16 sediment sampling locations reported new historic minimum concentrations of PFAS during the monitoring period
- Despite fluctuations at individual locations, concentrations of PFAS in sediment samples were generally within historical ranges in the samples collected during the monitoring period.

8.6.2 Temporal Trends

Temporal trend graphs were created (using the Defence [2022] PFAS OMP AIR Guidance) for PFOS+PFHxS and PFOA concentrations in sediments associated with Management Areas.

A summary of temporal data trend graphs by area are presented in **Table 26** below. These graphs are presented in **Appendix D**.

Table 26 Temporal sediment trend graphs by area

Graph ID	Area	Sediment Locations
G25, G26	North of the Site (on-Site and off-Site)	SD001, SD002, SD003, SD015, SD016, SD032
G27, G28	East of the Site (on-Site and off-Site)	SD005, SD007, SD008, SD009, SD011, SD013, SD014, SD018, SD019, SD020, SD023, SD030
G29, G30	West of the Site (on-Site and off-Site)	SD022, SD024, SD030, SD035

* SD020, SD024, SD030, SD035 are located outside the off-Site Management Area

A summary of sediment PFOS+PFHxS and PFOA concentrations for the select locations (including historical ranges and concentrations from the OMP events during the monitoring period) are discussed through temporal trend reviews based on the different regions within the three Management Areas in the following sub-sections.

Note that Mann-Kendall analysis was not used to assess the trends in PFAS concentrations in sediments, given that variables such as rainfall, which influence PFAS concentrations are not factored into the analysis.

Temporal trend analysis was undertaken for locations which were sampled in the current monitoring period. Locations with PFAS concentrations consistently below LOR were excluded.

Additionally, the 30-day average daily rainfall total (in mm) has been included on the temporal trend graphs to allow for assessment of the influence of rainfall on PFAS concentrations.

8.6.2.1 Temporal Trend – North of the Site

Sediment concentrations within the “north of the Site” area appeared to remain relatively stable throughout the monitoring period, with few spikes observed across all included locations. There is no obvious influence of rainfall on the concentrations in this area.

8.6.2.2 Temporal Trend – East of the Site

Similar to the surface water samples in this area, the PFOS+PFHxS and PFOA concentrations in sediment on the east of the Site remained generally within historic ranges during the monitoring period. Note that an increase in concentrations were reported following the rainfall events in 2021 and 2022, which brought PFAS concentrations up to the same order of magnitude as those reported in 2017. The highest concentrations in this area were within on-Site locations.

8.6.2.3 Temporal Trend – West of the Site

Sediment results west of the Site were characterised by three off-Site sampling locations, SD022, SD024 and SD035. At these locations PFOA concentrations remained at or near the LOR during the monitoring period. PFOS+PFHxS concentrations were relatively stable with observations from May 2020. An increase in concentrations was reported in SD022 in October 2022, though this was followed by reduced concentration readings, and an increasing concentration trend does not appear to be forming.

8.6.3 Summary of Sediment Results

The concentrations of PFAS generally remained within historical ranges over the monitoring period. The highest PFAS concentrations in sediment samples were at SD001 (located within the FFTG).

There were new detects of PFAS in sediment in off-Site locations to the east, south, north and north west in 2021.

The changes in the distribution of PFAS in sediments at and surrounding the Site are attributed to the increased rainfall observed at the Site during the monitoring period.

Based on the concentrations of PFAS in sediment there is no significant change to the risk to human health and the environment. The frequency and locations of sampling remains sufficient.

9.0 Conceptual Site Model

The Conceptual Site Model (CSM) was developed during the investigation stages (AECOM, 2018a) and summarised in the OMP (Defence, 2019a). The CSM summarises the linkages between PFAS sources, exposure pathways and receptors.

The OMP monitoring between December 2020 and June 2023 has provided additional data to further understand the changing conditions of the PFAS concentrations in groundwater and surface water. Key observations include:

- PFAS concentrations were generally within historical ranges
- Mann-Kendall trend analysis of groundwater monitoring data from different locations indicated variable trends, including stable, decreasing, increasing or inconclusive trends. New maximum concentrations and new detects were reported at selected locations and the changes are inferred to be potentially associated with increased rainfall during the monitoring period
- Despite new maximums and new detects, the inferred PFAS transport mechanisms and the groundwater, surface water and sediment concentrations are generally similar to those reported in AECOM (2018a) and AECOM (2021b). However, some localised increases were noted which are inconsistent with the CSM, in particular at MW107I and MW051
- While the increase in PFAS concentrations in groundwater detected at MW107I and nearby wells have increased the estimates of the mass flux of PFAS discharged off-Site via groundwater (AECOM, 2023a), surface water is still the largest contributor to PFAS mass discharge off-Site, and this does not alter the conceptual understanding of PFAS migration pathways for the Site
- PFAS concentrations in groundwater at the FFTG appear to be decreasing following soil remediation activities in this area (refer **Section 6.1.3**)
- In the area to the north of Bakers Lagoon, substantial (post-flooding) gully erosion affected the proposed surface water and sediment sample locations (SW081/SD081) which were unable to be sampled due to ongoing council rectification works. Additionally, it is not known what, if any, connection between Bakers Lagoon and the Hawkesbury River will be established post-rectification works. As such, no updates to the CSM in this area are proposed until a permanent engineering solution is implemented and can be understood in the context of surface water migration from Bakers Lagoon.

The PFAS remedial works and management planning activities continue to be undertaken at the Site per the SFARP principles, as summarised in **Section 6.1**. These remedial and management works will continue be updated in the following Interpretive Reports.

Overall, data presented in this report indicates that the PFAS sources, pathways and receptors has not significantly change the understanding of the CSM. Future monitoring will continue to contribute to an evaluation of any potential changes to the CSM.

10.0 Discussion

10.1 Risk Profile Review

The data collected during OMP monitoring between November 2019 and June 2023 indicates that the risk profile to human health receptors within the Management Area remains generally unchanged since the publication of the HHRA (AECOM, 2018b). A potential exception to this assessment is the evidently localised PFAS impacts identified on the north west boundary of the Site which is scheduled to be remediated in 2024. This is based on the following assessment of the OMP data:

10.1.1 Groundwater

- **Nature and Extent of Groundwater PFAS Impacts:** The nature and extent of PFAS concentrations in groundwater were generally similar to the 2020 AIR (AECOM, 2021d) with the highest concentrations reported at MW107I (northern Site boundary near the FTF) and MW051 (Area used by Fitters) in groundwater within the CFA.
- **Areas of Groundwater PFAS Concentration change:** The periods of increased rainfall which occurred during the monitoring period appear to have resulted in some localised increases in PFAS concentrations in groundwater, particularly in MW107I and MW051.
    - New detects were identified across all source areas
    - Higher PFAS concentrations were reported on the northern boundary of the Site at MW107I. These increases are inferred to be in response to high rainfall mobilising PFAS from the soil at this location. This area has been identified as a localised PFAS source and therefore, remediation activities are planned for this area which are scheduled to commence in late 2023 to ensure this PFAS does not leave the Site boundary
    - MW143 and MW144 were installed to replace MW098 and MW099 which were destroyed during flooding events in March 2021. The new wells were installed along Cupitts Lane south of Cooley Creek within the same hydrogeological unit as the destroyed wells. MW143 and MW144 were sampled for the first time in May 2023, reporting PFAS concentrations an order of magnitude higher than was previously reported at MW098 and MW099. The surface water concentrations nearby these wells were similar, and it is possible the PFAS detects in groundwater are likely to be a result of surface water transport during the flood events. The concentrations here will be monitored for changes at the next sampling event.
    - Despite the increases in PFAS impacts to groundwater described above, it is inferred that there is no overall change to the risk to human health and the environment
    - The frequency and locations of groundwater sampling remains sufficient. However, it is noted that further additional monitoring will be undertaken at the northern Site boundary near MW107I as part of remediation works proposed in this area.

10.1.2 Surface water

Areas of Surface water PFAS Concentration Change: The nature and extent of the PFAS impacts in surface water are generally similar to the 2020 AIR with highest concentrations reported at SW001 and SW002.

- There were first-time detects at SW018, located in Rickabys Creek downgradient of SW009 where the creek discharges to the Hawkesbury River were observed during the monitoring period. Detects at this location were recorded in the May 2021 and May 2022 events following significant rainfall events (refer Section 6.3). Corresponding increases in PFAS concentrations were detected at SW023 in Rickabys Creek in the same events. These changes in surface water contamination distribution are likely to be attributed to the increased rainfall observed at the Site during the monitoring period resulting in surface transport of PFAS from the known source areas. However, the detects are not considered to change the overall risk profile of the Site
- New maximum PFOS+PFHxS concentrations at SW005 and SW037 were also reported, which are located within the on-Site management area

- Based on the concentrations of PFAS in surface water there is no significant change to the risk to human health and the environment
- The frequency and locations of sampling remains sufficient.

10.1.3 Sediments

The highest PFAS concentrations in sediment samples in the monitoring period were at SD001 (located within the FFTG), however it is noted that these concentrations were within the range of historical concentrations at this location.

- There were new detects of PFAS in sediment in May 2021 off-Site at SD020 (PFOS+PFHxS) and SD016 and SD019 (PFOA). New maximum concentrations were reported in selected location in May 2021 but then subsequently decreased in November 2021. New maximum concentrations of PFOS and PFOS+PFHxS were reported in November 2021 include SD005, SD007, and SD019
- Based on the concentrations of PFAS in sediment there is no significant change to the risk to human health and the environment
- The frequency and locations of sampling remains sufficient.

Overall, it appears that that increased rainfall and flooding events during the monitoring period has influenced the extent and fluctuations in concentrations of PFAS in perched water, groundwater, surface water and sediment.

While there have been localised decreases and increases in PFAS concentrations in groundwater, surface water and sediment, there is currently no evidence that the overarching risk profile has changed profile based on the current land use within the Management Area.

PFAS exposure to off-Site land users within the off-Site Management Area is currently managed through New South Wales (NSW) Government Precautionary Advice by the NSW Environment Protection Authority (EPA).

Based on the data, it is considered that the conclusions made in the HHRA (AECOM, 2018b) still apply.

10.2 Assessment of current OMP

Based on the above review of the data collected during the current monitoring period, there are no significant changes to the understanding of the nature, extent or risks associated with PFAS at the Site and surrounding areas, or the need for monitoring of additional media. It is also understood that no significant OMP updates are required arising from stakeholder engagement or changes in land use.

Based on this, there are no triggers to the requirement of a review of the OMP (Defence, 2019a). However, since the development of the OMP, the following updated guidance has been published and adopted, and should be included in the next revision of the OMP:

- Recreational water use (NHMRC [2019], PFAS Recreational Water guidelines)
- Groundwater and surface water ecological guidelines (HEPA [2020], PFAS NEMP freshwater 99% species protection).

Additionally, the revised OMP will also include the recommended changes to the sampling locations, due to access restrictions, damaged monitoring wells or wells that could not be located. These additional recommendations are provided separate to this report.

11.0 Conclusions

Groundwater, surface water and sediment sampling was completed in general accordance with the SAQP (AECOM, 2023d) and to meet the objectives of the OMP (Defence, 2019a) between December 2020 and June 2023.

- Overall, the concentrations of PFAS in groundwater, surface water and sediment were generally consistent with the concentrations reported in the 2020 AIR with the exception of new maximums and new detects at selected locations likely attributed to significant rainfall events during the monitoring period
- Concentrations of PFAS in groundwater have been observed to decrease in the primary PFAS source area at the FFTG, while localised increases have been detected on-Site. The increase in PFAS concentrations detected on the northern boundary, which are inferred to be in response to climatic conditions mobilising PFAS impacts from a suspected local source (AECOM 2023a), may have the potential to increase the risk profile from PFAS impacts present in groundwater in this area. Therefore, future remediation activities have been nominated for this area as part of the Base Wide RAP (AECOM, 2023b)
- The groundwater plume extents are generally consistent with the representation presented in the 2020 AIR, with the exception of an apparent extension to the low-level concentration plume in the north. This northern extension in the plume is driven by the first-time detects in the newly installed monitoring wells MW143 and MW144. However, this apparent plume extension is unable to be confirmed due to the absence of sampling data from MW119 and MW120, located between the northern extent of the plume and the boundary of the Site. MW119 and MW120 are located on private property and permission to access was unable to be attained. Remediation on base is currently under review.
- Elevated PFAS concentrations were detected in Rickabys Creek at SW018 and SW023 following significant rainfall events however, this is not considered to change the overall risk profile of the Site, given there is no change to the source, receptor and pathways. In general, surface water concentrations were similar to the concentrations reported in the 2020 AIR
- The CSM was reviewed, and based on the results presented within this report, no changes were identified to source, pathway or receptors at the Site and within the Management Area
- Based on the data collected during the monitoring period, no changes to the risk profile were made, and no triggers have been identified which would require a review of the OMP. It is noted that the potential PFAS exposure to off-Site land users within the off-Site Management Area is currently managed through NSW Government Precautionary Advice by the NSW Environment Protection Authority.

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has prepared this Sampling and Analysis Quality Plan (SAQP) for the per- and poly-fluoroalkyl substance (PFAS) Ongoing Monitoring Plan (OMP) at **RAAF Base Richmond** (the 'Site') comprising the Management Area (on-Site Management Area, off-Site Monitoring Area and Bakers Lagoon Management Area) in the **NSW & JBT Region** (refer to **Figure 1** in **Appendix A**).

The SAQP supports the *PFAS Ongoing Monitoring Plan – August 2019, RAAF Base Richmond* (Defence, 2019), here-in referred to as OMP (Defence, 2019a).

The purpose of the OMP is to collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport (migration pathways and rates) and transformation of PFAS in the Management Area.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2019b).

1.2 SAQP Objectives

The objectives of this SAQP are to:

- define the proposed scope of works in detail.
- outline the proposed sampling methodology to be adopted.
- outline the proposed quality assurance and quality control (QAQC) measures to be adopted.
- define the data collection and management requirements for the project.

1.3 Scope of Works

To meet the program objectives, the following scope of works are proposed as per the OMP (Defence, 2019a):

- sampling of 69 on-Site groundwater monitoring wells and 14 off-Site groundwater monitoring wells every six months.
- sampling of 11 on-Site surface water locations and 12 off-Site surface water locations every six months.
- sampling of 10 on-Site sediment locations and 12 off-Site sediment locations every six months.
- reporting.

1.4 Guidelines and Legislation

The SAQP has been developed with reference to the following guidelines and legislation:

- Heads of Environmental Protection Agencies (HEPA), 2020. *PFAS National Environmental Management Plan (NEMP) 2.0*.
- National Environment Protection Council (NEPC), 2013. *National Environment Protection (Assessment of Site Contamination) Measure (NEPM)*
- Department of Defence, 2019. *Pollution Prevention Guideline – Annex 1L Routine Water Quality Monitoring. August 2019*
- Department of Defence, 2021. *Contamination Management Manual, August 2018 amended June 2021*

D R A F T

- Department of Health (DoH), 2017. *Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017*
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water. August 2019*
- Standards Australia 1998. *AS/NZ 5667:1998 Water Quality – Sampling*
- Australian and New Zealand Guidelines, 2018. *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*

D R A F T

2.0 Site Identification

2.1 Site Details

The Site is an active airbase and home of several squadrons and is best known for being home to the C130 Hercules medium transport aircraft. The Site features include:

- an airfield and associated buildings
- road verges are generally unpaved
- surface drains and other water bodies on the Site and off-Site.

The Site is located in a mixed residential and agricultural setting with the township of Richmond adjacent to the western boundary of the Site and predominantly turf farms to the north-east. The Site is located within the Hawkesbury City Council Local Government Area.

In August 2019, Defence released the PMAP, which identifies the following key areas that define the Management Area:

- On-Site Management Area
- Off-Site Management Area
- Bakers Lagoon Management Area.

These areas are presented on **Figure 1** in **Appendix A**.

2.2 Conceptual Site Model

The Conceptual Site Model (CSM) is presented in the Detailed Site Investigation (DSI) (AECOM, 2018a) which summarises the linkages between sources, exposure pathways and receptors. Further assessment of risk exposure pathways are presented in the Human Health Risk Assessment (HHRA) (AECOM, 2018b) and the Ecological Risk Assessment (ERA) (AECOM, 2018c).

D R A F T

3.0 Data Quality Assessment

3.1 Data Quality Objectives

The amended National Environmental Protection Measure (NEPM, 2013 Schedule B [2]) Guideline on Site Characterisation (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process (EPA QA/G-4: EPA/240/B-06/001), February 2006.*

The US EPA defines the process as *'a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect'.*

The process of establishing appropriate DQOs is defined according to the following seven steps:

Table 1 The seven steps in defining DQOs

Step	Data Quality Objective Step
1	**State the problem** – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	**Identify the goal of the study** – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	**Identify information inputs** – Identify data and information needed to answer study questions.
4	**Define the boundaries of the study** – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	**Develop the analytic approach** – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	**Specify performance or acceptance criteria** – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	**Develop the plan for obtaining data** – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed below.

3.1.1 Step 1 – State the Problem

Environmental investigations undertaken at the Site have identified PFAS in soil, sediment, surface water and groundwater primarily resulting from the historical use of aqueous film forming foam (AFFF) for fire protection purposes. The DSI (AECOM, 2018a) confirmed that the identified PFAS impacts in environmental media were not limited to within the Site boundary and appear to have migrated off-Site through a number of pathways.

Defence and State agencies require up-to-date data to assess the performance of implemented management actions and enable informed risk management decisions to protect human health and the environment, given that elevated concentrations of PFAS have been identified in environmental media.

The data collected by implementing the SAQP will provide a periodic dataset that can be used to assist with assessment of temporal changes in PFAS concentrations in groundwater and surface water/sediment on- and off-Site as well as assessing relative mass flux of pathways and how groundwater and surface water levels respond to natural fluctuations.

This will facilitate if required refinement of the CSM, allow update of the human health and ecological risk assessment and inform management decisions by Defence and NSW EPA, and possibly other government agencies.

D R A F T

The OMP will cover the primary implementation period of the PMAP and continue after the response management has ended. This is the timeframe over which PMAP remediation actions (or other short-medium term actions) have been completed, and the monitoring following this period will be assessed with advice from NSW Government.

The OMP will also continue to the extent required by specific characteristics of the Management Area and behaviour of the plume, measured against specified data trends.

3.1.2 Step 2 – Identify the Goal of the Study

The overarching goal of the study is to establish a systematic routine groundwater and surface water/sediment sampling and analysis program to provide current and ongoing information on the distribution and mass flux of PFAS in groundwater, surface water and sediment in the Management Area.

Furthermore, the specific questions that the study intends to address are as follows:

- what are the changes and trends in the nature, extent and magnitude of PFAS concentrations in groundwater, surface water and sediment within the Management Area?
- has the nature, extent or magnitude of PFAS concentrations within the Management Area changes significantly to warrant a revision of the CSM and/or the HHERA?
- has the nature, extent or magnitude of PFAS concentrations changes significantly to warrant refinement of any existing or proposed management measures?

3.1.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the study goal listed in Step 2 above, the following inputs will be considered:

- PFAS results from previous environmental investigations;
- meteorological data including rainfall;
- previous and new data collected during the residential sampling program, where permission to use the data has been granted by landowners;
- groundwater, surface water and sediment data collected and analysed for PFAS, as part of the SAQP;
- groundwater and surface water elevation data;
- statistical analysis of data to identify trends; and
- advances in laboratory analytical approaches and changes in regulatory requirements.

3.1.4 Step 4 – Define the Boundaries of the Study

The spatial and temporal boundaries that apply for data collection are detailed below and will influence the decision-making process for ongoing monitoring:

- the spatial boundary is limited to the Management Area, however is subject to change with input from the NSW Government (refer to **Figure 1** in **Appendix A**)
- the sampling completed as part of the SAQP will be limited to groundwater, surface water and sediment, at the frequencies defined in **Section 4.2**
- the monitoring will occur over an initial period of 3 years and continue over the 2 year extension period.

The SAQP will also cover the initial three-year Primary Implementation Period of the OMP (Defence, 2019a) and PMAP (Defence, 2019b) and continue after the response management has ended. This is the timeframe over which the PMAP remediation actions (or other short-medium term actions) have been completed, and the monitoring following this period will be assessed with advice from the NSW Government.

D R A F T

The SAQP will also continue to the extent required by specific characteristics of the Site and surrounds, and behaviour of the plume, measured against specified data trends.

3.1.5 Step 5 – Develop the Analytical Approach

The decision rules can be defined as:

- analytical selection; all samples will be analysed for the extended PFAS suite and selected media (groundwater and surface water) for major cations/anions and metals
- analytical method selection for PFAS is based on achieving appropriate laboratory limit of reporting (LOR) in the various media to be analysed
- sample locations have been selected with the objective of monitoring PFAS trends (temporal and seasonal), providing early warning of changes in the migration of PFAS in the Management Area in surface water and groundwater, and to assist with refinement of Management Area boundary over time, as required
- if the laboratory quality assurance/quality control (QA/QC) data are within the acceptable ranges, the data will be considered suitable for use
- if PFAS concentrations are reported above the laboratory LOR, where it was previously <LOR, then it will be considered whether further assessment of the data will be
- if the PFAS is reported at a concentration that is above drinking water guideline in groundwater, then it will be considered that further assessment is required
- if the PFAS is reported at a concentration that is inside a trigger value or acceptable range, then it will be considered whether monitoring is continued or reduced, this assessment will be undertaken after two years of monitoring.

3.1.6 Step 6 – Specify Performance or Acceptance Criteria

Specific limits for the works included in the SAQP are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and standard procedures for field sampling and handling.

This step also examines the certainty of conclusive statements based on the available new data collected. This should include the following points to quantify tolerable limits:

- a decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative
- a decision error in the context of the decision rule presented above would lead to either underestimation or overestimation of the risk level associated with a particular sampling area
- sampling errors may occur when the sampling program does not adequately detect the variability of a contaminant from point to point across the site. To address this, the SAQP outlines minimum numbers of samples proposed to be collected from each media
- as such, there may be limitations in the data if aspects of the SAQP cannot be implemented. Some examples of this scenario include but are not limited to:
    - proposed surface water sample locations may be dry at the time of sampling
    - proposed groundwater well locations are damaged or destroyed and therefore cannot be sampled
    - proposed samples are not collected due to access being restricted to a given location.
- limitations in ability to acquire useful and representative information from the data collected. The data are proposed to be collected from multiple locations and sample media. Some examples of this scenario include:
    - some of the data are proposed to be collected from landholder bores, which are not purpose-built for groundwater monitoring. In some cases, there is limited information on the bore

D R A F T

construction, and the likely presence of dedicated pumps or windmills may prevent groundwater depths being accurately recorded while also preventing groundwater being sampled using low flow techniques.

- measurement errors can occur during sample collection, handling, preparation, analysis and data reduction. To address this the following measures are proposed:
  - collection of sufficient sample mass to facilitate analysis reported to standard laboratory detections limits. Collection of insufficient sample mass may result in raised detection limits
  - field staff to follow a standard procedure when collecting samples, including decontamination of tools, and use of appropriate sample containers and preservation methods
  - laboratories to follow a standard procedure when preparing samples for analysis and undertaking analysis
  - laboratories to report quality assurance/quality control data for comparison with the DQIs established for the project.

3.1.7 Step 7 – Optimise the Design for Obtaining Data

The methodology presented in this SAQP is designed to meet the project objectives and to achieve the nominated DQOs.

Optimisation of the data collection process will be achieved by:

- working closely with the analytical laboratories and sampling equipment suppliers to ensure that appropriate procedures and processes are developed and implemented prior to and during the fieldwork, to ensure that sample handling, and transport to and processing by the analytical laboratories is appropriate
- conducting sampling according to Defence and Australian Standards for the type of sampling being conducted (i.e. groundwater monitoring well sampling versus landholder bore water sampling). These standards are as follows:
  - Department of Defence *Contamination Management Manual* (August 2018, Amended June 2021),
  - Standards Australia (AS/NZS5667.11–1998) *Water Quality – Sampling, part 11: Guidance on sampling of groundwater,*
  - Standards Australia (AS 4482.1-2005) *Guide to the sampling and investigation of potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds.*
- conducting sampling in accordance with AECOM's internal PFAS Sample Collection Guidance
- sampling conducted by suitably qualified and experienced field staff who have completed AECOM's internal PFAS 101 Training
- basing the sampling upon a CSM developed using the information available at the implementation of the OMP (Defence, 2019a). Updating the CSM as new data becomes available in the course of the implementation of the OMP (Defence, 2019a), as required
- progressive review of the data and modification of sampling programs to optimise the value of data generated
- continually seeking to identify opportunities for refinement and optimisation of the OMP, including, but not limited to, identifying redundant locations that can be excluded from the monitoring program. This will be achieved through an six-monthly review of the SAQP.

If the OMP objectives are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of Data Quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

D R A F T

- documentation and data completeness
- data quality – comparability, representativeness, precision and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use.

The acceptance criteria for DQIs for samples are specified in **Table 2**.

Table 2 Acceptance Criteria for Data Quality Indicators for Sample Analysis

Data Quality Indicators	Acceptance Criteria
Water and Sediment Samples	
Rinsates (where sampling equipment is reused)	Less than the laboratory LOR.
Field duplicates/Inter-lab duplicates	The relative percentage difference (RPDs) will be assessed as acceptable if less than or equal to 30% as per the NEPM (2013 Schedule B3 – *Guideline on Laboratory Analysis of Potential Contaminated Soils*). Where the results show greater than 30% difference a review of the cause will be conducted (NEPM, 2013 Schedule B3 – *Guideline on Laboratory Analysis of Potential Contaminated Soils*).). It is noted that RPDs that exceed this range may be considered acceptable where: • results are less than 10 times the LOR (no limit) • results are less than 20 times the LOR and the RPD is less than 50% • heterogeneous materials are encountered.
Laboratory duplicates	RPDs less than: • 20% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR).
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's QC report, based on their historical database.
Method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between laboratories specified range for each particular analyte/analytical suite.

D R A F T

4.0 Sampling Location Rationale and Methodology

4.1 OMP

The OMP (Defence, 2019a):

- identifies the specific inputs required to meet Defence's long-term strategic goals in relation to the management of PFAS contamination at the Site
- presents an overview of specific monitoring works to be undertaken
- provides the basis for the preparation of this SAQP.

This scope of works presented in this SAQP is consistent with that detailed in the OMP (Defence, 2019a), with the exception of those points of deviation presented in **Section 4.15**.

4.2 Proposed Schedule

4.2.1 Biannual Sampling

Groundwater, surface water and sediment sampling from across the Management Area will be performed on a six-monthly basis for a period of 5 years, with the initial sampling round completed in November 2019.

The schedule of fieldworks across the initial 5-year period is presented in **Table 3** below.

Table 3 Proposed Fieldwork Schedule

Sampling Round No.	Description of works	Proposed Schedule
1	Bi-annual groundwater, surface water and sediment sampling	November 2019
2	Bi-annual groundwater, surface water and sediment sampling	May 2020
3	Bi-annual groundwater, surface water and sediment sampling	November 2020
4	Bi-annual groundwater, surface water and sediment sampling	May 2021
5	Bi-annual groundwater, surface water and sediment sampling	November 2021
6	Bi-annual groundwater, surface water and sediment sampling	May 2022
7	Bi-annual groundwater, surface water and sediment sampling	November 2022
8	Bi-annual groundwater, surface water and sediment sampling	May 2023
9	Bi-annual groundwater, surface water and sediment sampling	November 2023
10	Bi-annual groundwater, surface water and sediment sampling	May 2024

4.3 Sample Location Rationale

4.3.1 Groundwater Sampling Locations

Groundwater monitoring will be undertaken on selected monitoring wells. The rationale for monitoring well selection for each area is summarised in **Table 4** below.

D R A F T

Table 4 Rationale for Groundwater Monitoring Locations

Area	Rationale
On-Site	• The DSI (AECOM, 2018a) identified temporal data as a data gap. To address this data gap, monitoring of spatial and temporal variations in PFAS concentrations in groundwater concentrations up, down and cross-gradient of source areas is required. Where the proposed management action is to implement management options at other source areas and to review the requirement for remediation or management when those outcomes are understood a higher sample density is required • Assess if groundwater PFAS concentrations within and downgradient of the source areas change in response to management measures over time • Continue to monitor wells to develop temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume to assist with understanding concentrations changes in the nominated transect alignments • Assess if background conditions change over time.
North of Site	• Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Monitor groundwater on transects parallel and perpendicular to the plume, to assist with understanding concentration changes in the nominated transect alignments • Continue to monitor wells to develop temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Sampling of 11 additional groundwater monitoring wells (MW004, MW106, MW107D, MW0107I, MW108, MW109, MW110, MW111, MW112, MW113 and MW114) to provide additional groundwater mass flux data.
West and north west of Site	• Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Monitor groundwater wells on transects parallel and perpendicular to plume, to assist with understanding concentrations changes in the nominated transect alignments • Continue to monitor wells to develop temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations •
East of Site	• Monitor groundwater wells on transects parallel and perpendicular to plume, to assist with understanding concentrations changes in the nominated transect alignments • Continue to monitor wells to develop temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations.
Cupitts Lane	• Monitor the plume to the north of the Site and in the Cuppitts Lane area • Monitor groundwater adjacent to Cooleys Creek where an isolated detection of PFAS in groundwater has been reported and is considered to be associated with surface water infiltration • Monitor potential changes in PFAS concentrations at the plume margins • Continue to monitor wells to develop temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, to assist with understanding concentrations changes in the nominated transect alignments.

D R A F T

Off-site monitoring locations will require the agreement of the landholder/leaseholder.

4.3.2 Groundwater Sampling Locations

The groundwater locations to be monitored on a six-monthly basis are provided in **Table 5** below and are presented on **Figure 2** in **Appendix A**.

Table 5 Groundwater Sample Locations

Area	Description	Sampling Locations	Number of wells/ bores	Total
On Site	West of Site (including Airfield Former Fire Ground/Training Ground)	MW008, MW009, MW010, MW040, MW041	5	69 Locations
	Airfield Foam Cannon Testing Area and Surrounds	MW030, MW053, MW054, MW056, MW057, MW058, MW059, MW107D, MW107I, MW108	10	
	Airfield Flight Line (including Fire Station, Building 291)	MW007, MW024, MW025, MW026, MW027, MW028, MW042, MW043	8	
	Site Infrastructure (including Hangar 54)	MW045, MW046, MW060, MW061, MW062, MW063, MW064, MW065, MW066, MW067, MW068, MW069, MW070, MW071	14	
	East of Site (including Tanker Parking Area and Former Fuel Farm 1)	MW047, MW048, MW050, MW051, MW052, MW072, MW073, MW074	8	
	Sewage Treatment Plant and Surrounds	MW020, MW021, MW022, MW023, MW036, MW109, MW110	7	
	Fuel Farm 2	MW032, MW033, MW034	3	
	Rickabys Drop Zone	MW001, MW002, MW004, MW005, MW012, MW013, MW014, MW015, MW016, MW017, MW111, MW112, MW113, MW114	14	
Off Site	West of Site	MW075, MW076, MW077, MW078, MW081	5	14 Locations
	North-west of Site	MW079, MW080, MW082, MW106	4	
	North-east of Site	MW143 and MW144	2	
	East of Site	MW086, MW091, MW092	3	

4.3.3 Surface Water Sampling Locations

The surface water monitoring locations have been selected to build on and maintain consistency with the monitoring completed during the 2018 DSI (AECOM, 2018a). Many of the locations have been previously sampled several times, and continued monitoring will provide additional data to assess temporal variability. The locations to be monitored on a six monthly basis are provided in **Table 6** below and are presented on **Figure 3** (in **Appendix A**).

Cooleys Creek is proposed to be monitored at SW016 downstream of Bakers Lagoon (known impacted area). No other identified PFAS sources would enter Cooleys Creek downstream of this point. As such

D R A F T

SW016 will adequately represent the concentration of PFAS from Cooleys Creek entering the Hawkesbury during when Cooleys Creek flows.

Rickabys Creek is to be monitored at two locations downstream of the confluence of other known impacted drains, as such, these locations adequately represent the concentration of PFAS in Rickabys Creek entering the Hawkesbury.

Location SW030 will capture any overall changes in concentration at locations up-stream of this point and therefore represents all impacts originating from the Site when compared with monitored concentrations at SW024 (representing background/up-stream PFAS concentrations). Given Cooleys Creek and Rickabys Creek are adequately represented by sample locations, and the Hawkesbury is monitored both up- and downstream of these creeks, it is not considered to be necessary that other DSI sample locations in between SW024 and SW030 be sampled, unless an increase in concentration is observed in Cooleys or Rickabys Creek.

Table 6 Surface Water Sampling Locations

Area	Description	Sampling Locations	Number of Locations	Total
On Site	North-west of Site (including STP discharge point)	SW001, SW002, SW003, SW037	4	11 Locations
	North-east of Site (including tributary of Rickabys Creek)	SW005, SW007, SW014	3	
	East of Site (including Rickabys Creek)	SW008, SW009, SW011, SW013	4	
Off Site	West of Site	SW022, SW024, SW035	3	12 Locations
	North of Site	SW015, SW016, SW081, SW085	4	
	East of Site	SW018, SW019, SW023, SW030	4	
	South of Site	SW020	1	

4.3.4 Sediment Sampling Locations

The sediment sample locations have been selected to be collocated with surface water sample locations[1] and to maintain consistency with the monitoring completed during the 2018 DSI (AECOM, 2018a). Many of the locations have been previously sampled several times, and continued monitoring will provide additional data to assess temporal variability. The locations to be monitored on a six-monthly basis are provided in **Table 7** below and are presented on **Figure 4** (in **Appendix A**).

Table 7 Sediment Sample Locations

Area	Description	Sampling Locations	Number of Locations	Total
On Site	North-west of Site (including STP discharge point)	SD001, SD002, SD003	3	10 Locations
	North-east of Site (including tributary of Rickabys Creek)	SD005, SD007, SD014	3	
	East of Site (including Rickabys Creek)	SD008, SD009, SD011, SD013	4	
Off Site	West of Site	SD022, SD024, SD035	3	12 Locations
	North of Site	SD015, SD016, SD081, SD085	4	
	East of Site	SD018, SD019, SD023, SD030	4	
	South of Site	SD020	1	

[1] Sediment samples will be collected at all surface water locations, with the exception of SW037 at the STP Settlement Pond.

D R A F T

4.4 Sample Collection and Handling

4.4.1 Groundwater Sampling

The groundwater sampling methodology and schedule are presented in **Table 8**.

Table 8 Groundwater Sampling Methodology and Schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured in each monitoring well prior to collection of groundwater samples. Additionally, during the Autumn(May) sampling event a gauging round of selected locations will be conducted prior to groundwater sampling to enable groundwater contours to be developed. The depth to groundwater will also be measured at the time of sampling at each location.
Sample Collection Methodology	**Groundwater Monitoring Wells** Groundwater samples will be collected from monitoring wells using no purge methodology with HydraSleeves™ which will be installed within the screened interval of the wells a minimum of 24 hours prior to sampling for the initial sampling round. Once sampling is completed, new HydraSleeves™ will be deployed at the screened interval depth in preparation for the next six-monthly sampling round. In the event that a HydraSleeve™ fails to deploy or has been removed inadvertently (i.e. by non-OMP project), the sample will be collected using a dedicated disposable bailer. Please refer to **Table T1** in **Appendix B** for well screen intervals and proposed HydraSleeve™ installation depths.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits) and rinsate samples.
Field Parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), ORP (oxidation-reduction potential), pH and observations of water quality will be recorded for all samples.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.
Sampling Schedule	The monitoring will include two 6 monthly monitoring events of 84 groundwater locations.

4.4.2 Surface Water Sampling

Table 9 provides the surface water sampling methodology and schedule.

Table 9 Surface Water Sampling Methodology and Schedule

Item	Details
Sample Collection Methodology	Samples to be collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container should be lowered into the water with the cap immediately applied once the container is full.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits) and rinsate samples.
Field Parameters	Temperature, Electrical Conductivity (EC), DO, ORP (oxidation-reduction potential), pH and observations of water quality will be recorded for all samples.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.

D R A F T

Item	Details
Sampling Schedule	The monitoring will include 6 monthly monitoring events at the selected 22 locations.

4.4.3 Sediment Sampling

Table 10 below provides the sediment sampling methodology and schedule.

Table 10 Sediment Sampling Methodology and Schedule

Item	Details
Sample Collection Methodology	Samples representative of potentially deposited sediments to be collected from within the water body if possible. Sediment samples will be collected using a hand auger from the base of the drain (where it is safe to do so) or using a Dormer Piston Sediment Sampler where access is restricted. At each location, a new laboratory supplied container should be used for each sample.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits) and rinsate samples.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.
Sampling Schedule	The monitoring will include bi-annual monitoring events at all 21 locations.

4.4.4 Sample Handling and Transport to Laboratory

AECOM personnel will attempt to reduce potential heterogeneity in the sample media matrix by dividing the sample collected between primary and intra-laboratory jars or bottles during sampling. All samples will be placed on ice in eskies immediately after sampling.

All samples will be kept, if possible, at approximately 4°C during transit to the laboratory. Prior to sampling, assessment of the analytical holding times will be made and the sampling planned accordingly to ensure that holding times are not breached or minimised.

Samples will be transported directly to the laboratory for analytical testing under standard chain of custody (CoC) procedures. Primary and associated duplicate QA/QC samples will be analysed by Australian Laboratory Services Pty Ltd (ALS). The inter-laboratory duplicate samples will be analysed by the Envirolab Group Pty Ltd (Envirolab).

4.5 Calibration

The water quality meter will be calibrated each day prior to the commencement of field activities with relevant solutions, including pH, EC and ORP. The calibration will be in accordance with manufacturers' instructions or NATA publication "General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note No. 19 (NATA 1994)". Where satisfactory calibration cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration details will be recorded on field sheets and included in the Sampling Events Factual Reports.

4.6 Logistics

The laboratory sample containers will be shipped from the laboratory to the AECOM office in Sydney prior to the commencement of fieldwork. All primary samples will be transported by an ALS supplied courier at the completion of fieldwork. All inter-laboratory duplicate samples will be couriered directly to the secondary laboratory under a separate CoC for analysis.

D R A F T

4.7 Analytical Suite and Laboratory Analysis Methods

4.7.1 Laboratory NATA Accreditation Details

The laboratory is required to use NATA accredited methods based on NEPM, US EPA, Table B 15 of the US Department of Defence/Department of Energy (US DOD/DoE) and American Society for Testing and Materials (ASTM) methods as appropriate.

The primary and secondary laboratories selected for this program are ALS (NATA Accreditation Number 825) and Envirolab (NATA Accreditation Number 2901), respectively.

4.7.2 Analytical Schedule

All media sampled shall be analysed for the extended PFAS suite as outlined in **Table 11** below.

Table 11 Sample Analytical Suite for PFAS

PFAS Group	Compound	CAS No.
Perfluoroalkyl Sulfonic Acids	Perfluorobutane sulfonic acid (PFBS)	375-73-5
	Perfluoropentane sulfonic acid (PFPeS)	2706-91-4
	Perfluorohexane sulfonic acid (PFHxS)	355-46-4
	Perfluoroheptane sulfonic acid (PFHpS)	375-92-8
	Perfluorooctane sulfonic acid (PFOS)	1763-23-1
	Perfluorodecane sulfonic acid (PFDS)	335-77-3
Perfluoroalkyl Carboxylic Acids	Perfluorobutanoic acid (PFBA)	375-22-4
	Perfluoropentanoic acid (PFPeA)	2706-90-3
	Perfluorohexanoic acid (PFHxA)	307-24-4
	Perfluoroheptanoic acid (PFHpA)	375-85-9
	Perfluorooctanoic acid (PFOA)	335-67-1
	Perfluorononanoic acid (PFNA)	375-95-1
	Perfluorodecanoic acid (PFDA)	335-76-2
	Perfluoroundecanoic acid (PFUnDA)	2058-94-8
	Perfluorododecanoic acid (PFDoDA)	307-55-1
	Perfluorotridecanoic acid (PFTrDA)	72629-94-8
	Perfluorotetradecanoic acid (PFTeDA)	376-06-7
Perfluoroalkyl Sulfonamides	Perfluorooctane sulfonamide (FOSA)	754-94-6
	N-Methyl perfluorooctane sulfonamide (MeFOSA)	31506-32-8
	N-Ethyl perfluorooctane sulfonamide (EtFOSA)	4151-50-2
	N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)	2448-09-7
	N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE)	1691-99-2
	N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)	2355-31-9
	N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)	2991-50-6
(n:2) Fluorotelomer Sulfonic Acids	4:2 Fluorotelomer sulfonic acid (4:2 FTS)	757124-72-4
	6:2 Fluorotelomer sulfonic acid (6:2 FTS)	27619-97-2
	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	39108-34-4

D R A F T

PFAS Group	Compound	CAS No.
	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	120226-60-0

The current standard laboratory limits of reporting (LOR) are described in **Table 12** below.

Table 12 Laboratory Limits of Reporting

Sample Media	Parameter	Technique/Method Reference	LOR*
Groundwater and Surface Water	Extended PFAS Suite	LC/MS-MS	0.002 – 0.1 micrograms per litre (µg/L)
Sediment	Extended PFAS Suite	LC/MS-MS	0.0002 – 0.001 milligrams per kilogram (mg/kg)

LC/MS-MS = Liquid chromatography–mass spectrometry, GC = Gas chromatography

*LOR for Australian Laboratory Services (ALS)

4.8 Sample Nomenclature

In order to meet Defence data management requirements, a consistent sample nomenclature has been adopted for the Program. All primary samples will be labelled using the following naming convention:

PPPP_XX000_ZZZ_YYMMDD

[property ID][type of sample][THREE DIGIT sample number]_[top of sample depth]_[yearmonthday]

e.g. 0902_MW001_191015

Location types and codes are prescribed by the Defence Contamination Management Manual, Annex L Data Management (June 2021) and the Site's investigation history.

Primary Sample Types/Location Codes relevant to this SAQP include:

- SD = sediment – top depth required
- MW = monitoring well
- SW = surface water - no depth required.

QAQC Samples will be labelled in accordance with the following convention:

- Duplicate: PPPP_QC1XX_YYMMDD
- Triplicate: PPPP_QC2XX_YYMMDD
- Rinsate: PPPP_QC3XX_YYMMDD.

4.9 Defence ESdat Requirements

Defence has contracted Earth Science Information Systems (EScIS), to provide contamination data management services through a cloud instance of its ESdat product.

All SAQP field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's ESdat database in accordance with Section 6 of Annex L to the Defence Contamination Management Manual. AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will upload the data from each monitoring event into ESdat prior to submitting the Sampling Event Factual Report.

D R A F T

4.10 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this SAQP, a number of guidance documents were in circulation in Australia including:

- PFAS National Environmental Management Plan (NEMP), (HEPA 2020) https://www.awe.gov.au/environment/protection/publications/pfas-nemp-2 .
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (FSANZ 2017).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC 2019).
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM).

The adopted PFAS screening criteria to assess the data generated as part of the SAQP are presented in **Table 13**.

4.10.1 PFAS Screening Criteria

The adopted screening criteria which have been adopted are presented in **Table 13** and **Table 14** below.

Table 13 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment/Reference
Drinking water - groundwater	PFOS+ PFHxS	0.07 µg/L	The values presented in the PFAS NEMP, 2020 are from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the tolerable daily intake (TDI) for PFOS and PFOA from FSANZ, 2017 and the methodology described in Chapter 6.3.3 of the National Health and Medical Research Council's (NHMRC) Australian Drinking Water Guidelines (ADWG), 2022 to determine drinking water values. For PFHxS, DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'. *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	In August 2019, NHMRC released guidance on the assessment of PFAS in surface water. Rather than adopting an ingestion rate of 0.2 litres (L) of water per day (as per the ADWG formula), NHMRC adjusted this rate with consideration of an event frequency (150 events/year) to calculate an annual ingestion rate of 30 L per year. The revised recreational use criteria presented in NHMRC have been adopted by the PFAS NEPM 2.0 (HEPA, 2020) *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	

D R A F T

Table 14 PFAS criteria summary: Ecological

Media	Pathway	Chemical	Criteria	Comment/Reference
Water	Freshwater	PFOS	0.00023 µg/L	HEPA (2020) NEMP 99% species protection
		PFOA	19 µg/L	HEPA (2020) NEMP 99% species protection

Note: HEPA (2018) notes that the 99% species protection level for PFOS is close to the level of detection. Agencies may wish to apply a 'detect' threshold in such circumstances rather than a quantified measurement.

4.11 Waste Management

Due to the proposed "no purge" sampling methodology, it is not anticipated that significant volumes of liquid waste would be generated that would require management or disposal.

All consumables (i.e. HydraSleeves™, filter cartridges, general rubbish) will be bagged and placed in on-site general waste bins for disposal.

4.12 Quality Assurance/Quality Control Sampling

4.12.1 Field Duplicate and Inter-laboratory Duplicate Samples

Field duplicate (intra-laboratory) duplicate samples and split (inter-laboratory field duplicates) are to be collected and analysed at a minimum frequency of 1 in 10 primary samples.

4.12.2 Rinsate Samples

Where there is the potential for cross contamination to occur between sampling locations. rinsate samples are to be collected at a rate of one sample per fieldwork day or at least one rinsate sample per ten primary samples (whichever rate is lower) by pouring laboratory supplied deionised water over the decontaminated sampling equipment.

4.13 Fieldwork Documentation

4.13.1 Field Notes

Field notes will be maintained to record all field sampling events and include observations made at each sample location. Field notes will include information specific to the sample media as follows:

- groundwater Samples – comments on the observed characteristics of the sample (e.g. colour, turbidity, odour, sheen) and reported field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded at regular intervals
- surface Water Samples – comments on the observed characteristics of the sample (e.g. colour, turbidity, odour, sheen) and field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded
- sediment Samples – comments on the morphology of the sample location, the depth, flow direction and strength of water flow (if water is present), the water and sediment/soil colour and odour, and the presence of flora and fauna. The soil/sediment types observed at each sample location will be described using the Unified Soil Classification System (USCS).

The geo-coordinates for each sample location will be noted. The location of quality control (e.g. duplicate and inter-laboratory duplicate) sample collection points will also be noted.

AECOM's tablet-based Environmental Data Collection and Analysis ('EDCA') tool will be utilized by field staff to capture consistent field data based on project specific requirements, minimise potential data transcription errors, allow on-the-spot identification of potentially erroneous data in comparison to historical data and facilitate efficient data transfer to multiple data systems including Esdat.

4.13.2 Sample Labels

Sample containers will be labelled, as a minimum, with the following information:

D R A F T

- AECOM project number
- name of sampler
- sample ID
- date of sample collection
- filtered vs non-filtered (for water samples only).

An indelible felt pen will be used for labelling, to ensure that the lettering is not erased during transit to the laboratory.

AECOM will utilize the tablet-based EDCA tool to streamline sample labelling and CoC creation to ensure compliant sample IDs are used in the field.

4.13.3 Chain of Custody Forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory.

The CoC form will include the following information:

- job number (Note: the name of the site is not identified for confidentiality purposes)
- date and time of sample collection
- sample ID
- type of containers
- name of sampler
- laboratory to be used
- analyses required
- any comments
- signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the Field Team, (i.e. samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed and the due date for the analytical results.

4.13.4 Sampling Documentation

Field sampling sheets will be completed for each location, and will include the following information (as appropriate for the media being sampled):

- name of sampler
- sample location
- date/time of monitoring/sampling
- sampling method
- observations of the sampled media
- calibration records.

Records of all equipment calibration will be included in the Sampling Event Factual Reports.

D R A F T

4.14 Reporting

4.14.1 Sampling Event Factual Report

No later than four weeks following the completion of each biannual sampling event, AECOM will prepare and submit a Sampling Event Factual Report to Defence. Each Sampling Event Factual Report will include:

- details of the scope of monitoring completed
- a description of the sampling methodologies used
- a summary of observations made while sampling (e.g. any visual or olfactory observations that may indicate impacts to surface water or groundwater)
- a summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement of decommissioning of a location
- a presentation of the analysis results in a table that includes comparisons with PFAS guidelines, highlighting any significant statistical deviations from historical monitoring and investigation data
- a presentation of the reduced groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction
- discussion of the analytical data quality, including review of the quality control sampling results and laboratory quality control data
- inclusion of the following information as attachments:
    - groundwater sampling forms including field water quality parameter measurements:
        - chain of custody forms
        - laboratory analytical certificates
        - equipment calibration certificates.

Factual reports will be prepared in accordance with Defence OMP Factual Report Guidance (May 2021).

4.14.2 Annual Interpretive Report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Annual Interpretive Report to Defence. Each Interpretive Report will include:

- evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Defence, 2019a)
- relevant figures depicting sampling locations and site-specific hydrogeological features
- laboratory results and analysis including comparison with relevant screening criteria as identified in the OMP (Defence, 2019a)
- assessment and commentary on appropriate QA/QC procedures
- a review of the Conceptual Site Model and provision of a revised Conceptual Site Model if required
- data interpretation, including trends in groundwater concentration, gradient and flow directions
- assessment of statistically based trends that may inform decision making when it comes to the revision of the OMP (Defence, 2019a)
- a statement as to whether the risk profile has changed overall, or for any specific location at the Site, and a recommendation as to whether this should trigger an OMP and/or PMAP review, or other action.

D R A F T

Additionally, an assessment of available mass flux data collected during the 12-month monitoring period (likely to be undertaken as part of a separate program of works to the PFAS OMP) will also be included if the data is available at the time of reporting.

Interpretive reports will be prepared in accordance with Defence OMP Interpretive Report Guidance (November 2021).

4.15 Deviations from OMP

While the scope of works and methodology described in this SAQP are generally consistent with that presented in the OMP (Defence, 2019a), a number of points of deviation are noted (refer to **Table 15** below).

Table 15 Deviations from OMP

No.	Description	Rationale
1	Use of HydraSleeves™ rather than low flow/bladder pumps for the collection of groundwater samples	The OMP (Defence, 2019a) specified that groundwater samples were to be collected using low flow sampling equipment (bladder pump). As part of AECOM's tender submission for the Defence OMP Program in March 2019, it was proposed to complete groundwater sampling across all Defence regions utilising no-purge HydraSleeves™. In addition to time and cost saving considerations, the adoption of HydraSleeves™ across the broader program was aimed to improve consistency, quality and comparability of groundwater data across sites and regions. In the event that a HydraSleeve™ fails to deploy or has been removed inadvertently (i.e. by non-OMP project), the sample will be collected using a dedicated disposable bailer.
2	Download of data loggers to occur on a six-monthly basis	The OMP (Defence, 2019a) specified that data loggers were to be downloaded on a 3 monthly-basis. In order to streamline the download of the data with other Site activities, a download of the logger data was undertaken during the biannual groundwater sampling events (every 6 months) from November 2019 to May 2021.
3	Adoption of Revised Recreational Screening Criteria for PFOS+PFHxS and PFOA	Following the release of the OMP (Defence, 2019a) in August 2019, the National Health and Medical Research Council (NHMRC), published guidance on PFAS in Recreational Water. The adopted screening criteria for PFOS+PFHxS and PFOA in surface water have therefore been revised to 2 µg/L and 10 µg/L, respectively. This is reflected in **Table 13**.
4	SW/SD040 and SW/SD041	In November 2019, AECOM was instructed by Defence to omit residential sampling locations SW/SD040 and SW/SD041 from the OMP program due to sensitivities with the landowner
5	Removal of Mass Flux Assessment from OMP Program	In November 2019, Defence instructed AECOM to remove activities related to the assessment of mass flux at the Site from the OMP as these will be completed under a separate program of works (PMAP Implementation Contract).
6	Removal of MW019	In November 2019, AECOM was unable to locate monitoring well MW019 in Rickaby's Drop Zone and noted that it was likely that this well had been destroyed due to the presence of PVC

D R A F T

No.	Description	Rationale
		pipe fragments in the general vicinity. Given that nearby monitoring wells MW015 and MW016 provide sufficient coverage of the area, AECOM recommended that this location be removed from the OMP in the November 2019 Sampling Event Factual Report.
7	Removal of MW029	AECOM was unable to locate monitoring well MW029 during the November 2019, May 2020 and November 2020 sampling events. Given that the existing monitoring well network provides sufficient coverage of this area, AECOM recommended the removal of MW029 from the OMP in the November 2020 Sampling Event Factual Report
8	Non-PFAS Analysis	On 27 January 2021, Defence instructed AECOM to discontinue the analysis of samples for non-PFAS analytes unless it was specifically requested in the OMP, or approved by Defence.
9	Removal of collection of continuous water level data	In consultation with the Lead Consultant (AECOM), it was agreed that the requirement to collect continuous water level data at seven ground water loggers and four surface water level loggers for a minimum period of 12 months has been fulfilled. The continuous water level logger data collected between November 2019 and May 2021 was considered to provide a sufficiently representative data set for the purposes of the OMP, and can now be discontinued. Therefore, this task has been removed from the updated SAQP.
10	POT001 and POT002 replaced with MW120 and MW121	During the May 2021 sampling event, private property bores POT001 and POT002 were observed to have been decommissioned by the property owner. The property owner informed AECOM that they had replaced these bores with two new bores (denoted as MW120 and MW121) that had been installed to depths of 16.81 m bgs and 17.31 m bgs (respectively). As discussed, and agreed with Defence on 7 May 2021, private bore locations POT001 and POT002 have been removed from the OMP scope of works and replaced with MW120 an MW121.
11	Collocated Surface Water and Sediment Location (SW081 / SD081)	As presented to the NSW TAG on 27 October 2021, a new collocated surface water and sediment sample (denoted as SW081 / SD081) has been added to the OMP scope. The rationale for this new location is to assess concentrations of PFAS leaving Bakers Lagoon to the north via an ephemeral tributary that flows beneath Cornwallis Road before discharging to the Hawkesbury River.
12	Residential Bore Sampling Methodology	Given that during May 2020, no infrastructure (i.e. taps) was connected to private property bores MW120 and MW121, the proposed sampling methodology detailed in Table 9 has been amended to reference either low flow sampling or bailer sampling.
13	Ratio of Intra- and Inter-laboratory duplicates	To align with the guidance presented in the HEPA NEMP 2.0 (2020), the target ratio of intra- and inter-laboratory duplicate samples has been amended to be 1 per 10 primary samples.

D R A F T

No.	Description	Rationale
14	11 additional monitoring wells added to OMP scope	On 11 November 2021, Defence requested that AECOM add 11 additional groundwater monitoring wells (MW004, MW106, MW107D, MW0107I, MW108, MW109, MW110, MW111, MW112, MW113 and MW114) to the OMP scope of works to be sampled on a biannual basis for PFAS. The addition of these monitoring wells to the OMP is in response to a recommendation made in AECOM (2021) *RAAF Richmond PFAS Mass Flux – October 2021*. The purpose of monitoring these wells is to provide additional groundwater mass flux data.
15	Three additional monitoring wells added to OMP scope	On 19 November 2021, Defence requested that AECOM add three additional groundwater monitoring wells (MW117, MW118 and MW119) to the OMP scope of works to be sampled on a biannual basis for PFAS. The addition of these monitoring wells to the OMP is in response to a recommendation made in AECOM (2020) *RAAF Richmond Former Fire Training Ground (FFTG) Remedial Action Plan (RAP) – October 2021.* The purpose of monitoring these wells is to assess the effectiveness of the remedial activities undertaken at the FFTG in 2021.
16	Removal of MW006 and MW099	During the November 2021 OMP sampling event, monitoring wells MW006 and MW099 were observed to have been destroyed and were unable to be sampled. AECOM recommended that these locations be removed from the OMP, as the existing monitoring well network provides sufficient coverage in these areas.
17	Removal of MW117, MW118 and MW119	Monitoring wells MW117, MW118 and MW119 (located on-site, airside) were compromised by surface water ingress in 2021. AECOM received direction from Defence (correspondence dated 24 May 2022) to remove these wells from the OMP scope of works.
18	Removal of MW095	Given that the existing monitoring well network provides sufficient coverage in this area, AECOM recommended in the *Sampling Event Factual Report – May 2022* that this location be removed from the OMP scope of works
19	Removal of MW120, MW121, SW032 and SD032	Due to access restrictions, AECOM recommended in the *Sampling Event Factual Report – May 2022* that these private property locations be removed from the OMP scope of works
20	Addition of one new collocated surface water/sediment location: SW085 and SD085	Following the removal of collocated surface water/sediment sampling locations SW032/SD032 from the OMP in 2022, Defence instructed AECOM to assess alternate access arrangements to Bakers Lagoon to collect surface water and sediment data. In February 2023, access to Bakers Lagoon for the purposes of sampling has been secured under an access agreement with a local resident.
21	MW097 and MW098 replaced with MW143 and MW144	Monitoring wells MW097 and MW098 were unable to sampled during the November 2022 sampling event, as they could not be located despite multiple attempts being made and the use of a surveyor with a differential GPS. Both wells are likely to have been destroyed during the floods proceeding the sampling event. The lack of data from this area presents a data gap in the off-site coverage of the down-hydraulic extent of the identified PFAS groundwater plume. As such, AECOM has

D R A F T

No.	Description	Rationale
		proposed the replacement of these monitoring wells with new wells of similar construction. New monitoring wells MW143 and MW144, installed on 26 April 2023, will replace MW097 and MW098 (respectively) in the OMP scope of works, from the May 2023 sampling event.
22	Removal of monitoring well MW044	In the November 2022 Sampling Event Factual Report, AECOM recommended the removal of monitoring well MW044 from the OMP as it could not be located during the November 2022 event despite the assistance of a metal detector and a surveyor using a differential GPS. It is considered likely that the well was destroyed during base redevelopment works. Following discussions with Defence's Lead Consultant and given that there are a number of other existing monitoring wells nearby being sampled under the OMP (e.g. MW045 and MW46), AECOM considered that the remaining well network provides sufficient coverage of this area.
23	Removal of additional non-PFAS data analysis	The additional analysis part of the original scope of works included: nutrients (ammonia, nitrate, nitrite, phosphorous), selected metals (aluminium, bromine, iron and manganese), and anions and cations. In the previous revision of the SAQP (Rev J) this analysis was to be scheduled for samples from monitoring wells MW001, MW009, MW010, MW022, MW075, MW081 MW082, MW091, MW097 and MW098, and surface water sampling locations SW003, SW008, SW009, SW015, SW016, SW020, SW022, SW023, SW024 and SW035. The original objective for conducting the additional analysis was to identify potential correlation between PFAS and non-PFAS concentrations, in order to identify any significant off-site contributions to PFAS concentrations from agriculture or heavy industries. Sufficient non-PFAS data was collected during the initial OMP implementation period (a three year period) and no correlation was found based on the data collected to date. As such, the requirement to collect and analyse non-PFAS data was re-assessed in conjunction with Defence's current Lead Consultant (AECOM) and was determined no longer necessary. Following the review of the *Sampling Event Factual Report – November 2022*, on 17 March 2023, Defence approved of the removal of the non-PFAS data analysis requirement.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) at the RAAF Base Richmond (the 'Site') in the NSW and Jervis Bay Region. The location of the Site and Management Area is shown in **Figure 1** in **Appendix A**.

The OMP (Defence, 2019a) for the Site outlines the requirement to complete biannual groundwater, surface water and sediment sampling.

Following each sampling event, a sampling event factual report will be prepared. Annual interpretative reports will be prepared following the completion of each 12-month sampling period. This Sampling Event Factual Report has been prepared to report the results of the biannual sampling event completed in May 2021, specifically highlighting first time detections and/or first-time exceedances of human health screening criteria for PFOS+PFHxS and/or PFOA.

This reported has been prepared in accordance with the Defence *PFAS OMP Factual Report Guidance,* Version 0.2 dated May 2021 (Defence, 2021).

1.2 Objectives

The objectives of the OMP program are to:

- Implement the Ongoing Monitoring Plan (Defence, 2019a) prepared as part of the Detailed Environmental Investigations; and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport and transformation of PFAS at each property.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2019b).

The objective of this phase of works is to implement the scope of works for the May 2021 sampling event in accordance with the Sampling and Analysis Quality Plan (SAQP) (AECOM, 2021).

2.0 Scope of Work

2.1 Summary of Scope

The biannual sampling event was completed in general accordance with the SAQP (AECOM, 2021). In summary, the scope of works completed included:

- Obtain permission (where required) to conduct works at the Site, off-site publicly accessible areas and privately owned properties
- Gauging of groundwater level in monitoring wells prior to collection of samples (refer to **Table 1** below, and **Figure 2** in **Appendix A** for specific locations)
- Collection of groundwater samples from 76 existing monitoring wells using either Hydrasleeves™ or dedicated, disposable bailers. It is noted that samples from four monitoring locations could not be collected during this sampling event (refer to **Table 9** for more details)
- Collection of 22 surface water samples (refer to **Table 2** below, and **Figure 3** in **Appendix A** for specific locations) and refer to **Table 11** for further details
- Collection of 19 sediment samples (refer to **Table 3** below, and **Figure 4** in **Appendix A** for specific locations). It is noted that sediment samples from two locations could not be collected during this sampling event (refer to **Table 13** for further details)
- Collecting of field duplicate samples at a rate of 1 in 20 primary samples and collecting one rinsate sample per fieldwork day
- Collection of data from four surface water level loggers, eight groundwater level loggers and one barometric logger installed in November 2019 (refer to **Table 4** below and **Figure 2** in **Appendix A** for specific locations). It is noted that one groundwater level logger (MW099) was unable to be retrieved (refer to **Table 9** for further details)
- Analysis of samples for the following:
  - all samples for the PFAS suite at the standard limit of reporting (LOR).
  - 20% of groundwater and surface water samples for nutrients (ammonia, nitrate, nitrite, phosphorous) and selected metals (aluminium, bromide, iron and manganese)
- Data management of the OMP field and laboratory data in Defence ESdat database
- Preparation of this Sampling Event Factual Report.

2.2 Planned Monitoring Locations

The monitoring locations outlined within the SAQP (AECOM, 2021) for the planned biannual groundwater, surface water and sediment sampling events are outlined in **Table 1**, **Table 2** and **Table 3** below.

Table 1 Groundwater Sampling Locations

Area	Description	Sampling Locations	Number of wells/ bores	Total
On Site	West of Site (including Airfield Former Fire Ground/Training Ground)	MW008, MW009, MW010, MW040, MW041	5	62 Locations
	Airfield Foam Cannon Testing Area and Surrounds	MW030, MW053, MW054, MW056, MW057, MW058, MW059	7	

Area	Description	Sampling Locations	Number of wells/ bores	Total
	Airfield Flight Line (including Fire Station, Building 291)	MW007, MW024, MW025, MW026, MW027, MW028, MW042, MW043	8	
	Site Infrastructure (including Hangar 54)	MW044, MW045, MW046, MW060, MW061, MW062, MW063, MW064, MW065, MW066, MW067, MW068, MW069, MW070, MW071	15	
	East of Site (including Tanker Parking Area and Former Fuel Farm 1)	MW047, MW048, MW050, MW051, MW052, MW072, MW073, MW074	8	
	Sewage Treatment Plant and Surrounds	MW020, MW021, MW022, MW023, MW036	5	
	Fuel Farm 2	MW032, MW033, MW034	3	
	Rickabys Drop Zone	MW001, MW002, MW005, MW006*, MW012, MW013, MW014, MW015, MW016, MW017, MW095	11	
Off Site	West of Site	MW075, MW076, MW077, MW078, MW081	5	18 Locations
	North west of Site	MW079, MW080, MW082, MW120**, MW121**, POT001*, POT002*	7	
	North East of Site	MW097, MW098, MW099*	3	
	East of Site	MW086, MW091, MW092	3	

Note: *Location not sampled. Refer to **Table 9** for further details

Alternative residential groundwater bore location sampled. Refer to **Table 9 for more details

Table 2 Surface Water Sampling Locations

Area	Description	Sampling Locations	Number of Locations	Total
On Site	North west of Site (including STP discharge point)	SW001, SW002, SW003, SW037	4	11 Locations
	North east of Site (including tributary of Rickabys Creek)	SW005, SW007, SW014	3	
	East of Site (including Rickabys Creek)	SW008, SW009, SW011, SW013	4	
Off Site	West of Site	SW022, SW024, SW035	3	11 Locations
	North of Site	SW015, SW016, SW032	3	
	East of Site	SW018, SW019, SW023, SW030	4	
	South of Site	SW020	1	

Table 3 Sediment Sampling Locations

Area	Description	Sampling Locations	Number of Locations	Total
On Site	North west of Site (including STP discharge point)	SD001, SD002, SD003	3	10 Locations
	North east of Site (including tributary of Rickabys Creek)	SD005, SD007, SD014	3	
	East of Site (including Rickabys Creek)	SD008, SD009, SD011, SD013	4	
Off Site	West of Site	SD022, SD024, SD035	3	11 Locations
	North of Site	SD015, SD016, SD032	3	
	East of Site	SD018*, SD019, SD023*, SD030	4	
	South of Site	SD020	1	

Note: *Location not sampled. Refer to **Table 13** for further details

The locations of continuous groundwater and surface water level loggers are outlined in **Table 4**, below.

Table 4 Continuous Water Level Logger Locations

Continuous Level Logger Group	Primary Rationale	Level Logger Locations	Site Specific Rationale
Groundwater Hydraulic Gradients	Evaluate hydraulic gradients at key areas.	MW040 and MW099*	Evaluate the hydraulic gradient between the Former Fire Training Area and Cupitts Lane.
		MW050 and MW001	Evaluate the hydraulic gradient between the Tanker Parking Area and Rickabys Creek.
Receiving Environment (SW & GW paired locations)	Interpret groundwater and surface water interactions at major receiving water bodies. Provide an indication of the antecedent conditions when PFAS sampling rounds occur. Provide an indication of the source of PFAS at the time of sampling. i.e. from groundwater (gaining conditions) or surface water (losing conditions).	MW001 and SW008	Paired surface water and groundwater well location closest to Rickabys Creek. Downstream of surface water discharge point east of the Site. Will provide an indication of surface water levels downstream from onsite management actions.
		MW081 and SW022	Paired surface water and groundwater well location closest un-named tributary of Rickabys Creek. MW081 is located close to the western edge of the groundwater plume.
		MW097 and SW016	Paired surface water and groundwater well location closest to Cooleys Creek. MW097 has an isolated detection.

Continuous Level Logger Group	Primary Rationale	Level Logger Locations	Site Specific Rationale
		MW098 and SW015	Paired surface water and groundwater well location closest to Un-named tributary of Rickabys Creek. Downstream of surface water discharge point north of the Site. Will provide an indication of surface water levels downstream from onsite management options.

*Note. Data logger not retrieved as the monitoring well appeared to have sustained damage during widespread flooding in March 2021, and the logger was not present within the well at the time of sampling.

3.0 Deviations from the SAQP

The May 2021 sampling event was completed in general accordance with the SAQP (AECOM, 2021) with the exception of the deviations outlined in **Table 5** below.

Table 5 Deviations from SAQP (AECOM, 2021)

SAQP	May 2021 Sampling Event
78 groundwater locations are identified to be sampled as part of the biannual sampling event	Residential groundwater bores POT001 and POT002 were decommissioned by the property owner prior to the May 2021 sampling event and could not be sampled. As an alternative, the field team collected samples from two newly installed bores on the property (denoted as MW120 and MW121). Monitoring well MW006 (located in Rickabys Drop Zone) appeared to have sustained damage during the recent flooding in March 2021. The well cap was missing and the top of casing was submerged beneath pooled surface water (indicating that the integrity of the well was compromised), therefore no samples were collected. Monitoring well MW099 (located off-Site along Cupitts Lane) appeared to have sustained damage during the recent flooding in March 2021. The entire well gatic had been cleaved in two and the well cap was missing, enabling surface water ingress. The data logger installed in this well in November 2019 could not be located. No sample was collected.
Groundwater samples are to be collected using hydrasleeves™ deployed prior to the sampling event	Grab samples were collected using dedicated, disposable bailers from residential groundwater bores MW120 and MW121 as it was not practical to deploy hydrasleeves™ at these locations. Groundwater samples at MW033, MW045, MW074 were collected using dedicated, disposable bailers as the hydrasleeves™ failed to deploy.
Following the completion of the sampling event, new hydrasleeves™ are to be deployed ahead of the next scheduled event.	HydraSleeves™ were not replaced in 24 monitoring wells (MW005, MW006, MW007,MW009, MW010, MW020, MW032, MW033, MW041, MW043, MW047, MW050, MW051, MW052, MW053, MW056, MW057, MW058, MW059, MW060, MW061, MW072, MW073 and MW078) following sampling as these locations are due to be sampled by the Defence EMOS contractor completing the Regional Water Quality Monitoring Program (RWQMP) event before the next scheduled OMP sampling event in November 2021. New HydraSleeves™ will be installed in these wells prior to the November 2021 OMP sampling event.
21 sediment locations are identified to be sampled as part of the biannual sampling event	Due to bank instability issues resulting from the recent flooding in March 2021 it was determined that sediment samples could not be collected from locations SD018 and SD023 due to safety concerns.
Surface water samples are to be collected by lowering a laboratory supplied container into the water with the cap immediately applied once the container is full.	Due to safety and access considerations, surface water samples were collected using dedicated disposable bailers from SW018 and SW023.

4.0 Methodology

4.1 Sampling Methodology

The methodology adopted for the May 2021 biannual sampling event was in accordance with the SAQP (AECOM, 2021) and summarised below:

Table 6 Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater (in metres below top of casing [m btoc]) was measured in each monitoring well immediately prior to collection of groundwater samples using an interface probe, with the exception of MW006 and MW099. In MW006, the depth to water (in m btoc) could not be accurately measured as the surveyed top of the PVC casing of the monitoring well had been broken at ground level. At MW099, the gatic cover had been damaged and the well open to surface water ingress, resulting in pooled water above to top of casing.
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all groundwater and surface water samples with the exception of MW028, where there was insufficient water present to collect parameters. Field parameters were collected using a calibrated water quality meter (WQM), with equipment supplier and field calibration records provided in **Appendix C**.
Sampling methodology-	Groundwater samples were collected from the majority of monitoring wells using no-purge methodology (i.e. HydraSleeves™), which were installed within the screened interval of the wells greater than 24hrs prior to the sampling round. Installation depths were based on a review of the well construction logs. Once sampling was completed, new HydraSleeves™ were deployed in the majority of monitoring wells at the screened interval depth in preparation for the next sampling round. Grab samples were collected from newly identified alternative residential sampling locations MW120 and MW121 using dedicated, disposable bailers. A grab sample was collected from MW033, MW045 and MW074 using dedicated, disposable bailers as the hydrasleeves™ failed to deploy. Additionally, HydraSleeves™ were not replaced in monitoring wells MW005, MW006, MW007, MW009, MW010, MW020, MW032, MW033, MW041, MW043 MW047, MW050, MW051, MW052, MW053, MW056, MW057, MW058, MW059, MW060, MW061, MW072, MW073 and MW078 as they are due to be sampled by the Defence EMOS contractor completing the RWQMP event before the next scheduled OMP sampling event in November 2021. New HydraSleeves™ will be installed in these wells prior to the November 2021 OMP sampling event. The majority of surface water samples were collected by lowering a laboratory supplied container below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container was lowered into the water with the cap immediately applied once the container was full. At SW018 and SW023, the samples were collected using dedicated, disposable bailers, before being decanted into laboratory supplied bottles. Sediment samples were collected using a trowel from the base of the drain. At each location, a new laboratory supplied container was used to collect the sample. The trowel was decontaminated between sampling locations using a detergent (Liquinox® solution, a PFAS-free detergent) followed by a double rinse with laboratory supplied de-ionised (PFAS free) water.

Item	Details
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits) and rinsate samples. Refer to **Appendix D** for assessment of QA/QC sample data.
Sample analysis	Samples were submitted to the primary and secondary laboratories for analysis detailed in **Section 2.0**. ALS Environmental (ALS) Sydney, NSW was used as the primary laboratory. The National Measurement Institute (NMI) of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses were certified by the National Association of Testing Authorities (NATA). Laboratory certificates are presented in **Appendix E**.

4.2 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- PFAS National Environmental Management Plan 2.0 (NEMP), (HEPA 2020) (https://www.environment.gov.au/protection/publications/pfas-nemp-2)
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (FSANZ 2017).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC 2019).
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM).

The adopted screening criteria which have been adopted are presented in **Table 7** below.

Table 7 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment/Reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values presented in the PFAS NEMP, 2020 are from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the TDI for PFOS and PFOA from FSANZ, 2017 and the methodology described in Chapter 6.3.3 of the National Health and Medical Research Council's (NHMRC) Australian Drinking Water Guidelines (ADWG), 2016 to determine drinking water values. For PFHxS, DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'.
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	In August 2019, NHMRC released guidance on the assessment of PFAS in surface water. Rather than adopting an ingestion rate of 0.2 L of water per day (as per the ADWG formula), NHMRC adjusted this rate with consideration of an event frequency (150 events/year) to calculate an annual ingestion rate of 30 L per year.
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	The values are from the PFAS NEMP, 2020 which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality – draft default guideline values. AECOM understands that these guidelines are currently being reviewed and will consider the appropriateness of considering any future revision. The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value.
	PFOA	19 µg/L	

4.3 Data Quality Objectives and Data Validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).

Data validation assessment is provided in **Appendix D**.

Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) requirements.

5.0 Field Observations and Results

5.1 General Field Observations

The following field observations were applicable across the entirety of the sampling event.

Table 8 General Field Observations

Items	Observations
Weather Conditions	During the May 2021 sampling event, the weather in general was observed to be partly cloudy and cool to moderate temperature with a maximum daily temperature of 24.9˚C recorded on Monday, 3 May 2021. 49.6 mm of rainfall was recorded between 3 and 7 May 2021 at RAAF Base Richmond (Richmond RAAF NSW, 067105) (Bureau of Meteorology, 2021).
Estate Management Works or Training Activities	During the sampling event, no notable estate works, or training activities were observed in the vicinity of the sampling locations with the exception of the following: • Excavation and stabilisation of PFAS impacted soils being completed at the Former Fire Training Ground (near MW040) in the western portion of the Site. The works were being undertaken by Synergy Resource Management (Synergy) and being supervised by AECOM.

5.2 Groundwater Observations and Field Measurements

Table 9 Groundwater Observations and Field Measurements

Compound	Criteria
Fieldwork Dates	The groundwater sampling was completed between 3 and 7 May 2021.
Access and Sample Collection	All monitoring wells and bores were accessible and able to be sampled with the exception of the following: • Private bore samples POT001 and POT002 could not be collected as the owner of the private property had decommissioned them • Monitoring well MW006 and MW099 were observed to be damaged with visible surface water ingress and were not sampled
Monitoring Well Network Condition	MW006 and MW099 were observed to be damaged with missing and/or broken caps and gatics. Due to visible surface water ingress, these wells were not sampled
Contamination Observations	No visible indications of contamination were observed during the sampling.
Continuous Water Level Data Loggers	Data was retrieved from four surface water level loggers, seven groundwater level loggers and one barometric logger installed in November 2019. Data could not be retrieved from the data logger previously installed in MW099 as the monitoring well appeared to have sustained damage during widespread flooding in March 2021, and the logger was not present within the well at the time of sampling.

Compound	Criteria
Depth to Groundwater and flow direction	Depth to groundwater ranged from 0.11 (MW013) and 17.355 (MW054) m btoc. Groundwater elevations in the aquifer were between 3.333 (MW033) and 15.42 (MW071) m AHD. Groundwater gauging data is presented in **Table T1** in **Appendix B**. Inferred groundwater contours and groundwater flow directions at the site in May 2021 are shown on **Figure 3** in **Appendix A**. The inferred local groundwater flow direction is towards the north and northeast with mounding observed in the vicinity of Hangar 54 and in the eastern corner of the Site, which was generally consistent with the DSI (AECOM, 2018), and flow directions observed during previous PFAS OMP monitoring events.
Geochemical Parameters	Groundwater geochemical parameters were measured prior to collecting groundwater samples. The stabilised readings are presented in **Table T1** in **Appendix B**, and are summarised below: • Dissolved oxygen ranged from 0.79 mg/L (MW092) to 9.43 mg/L (MW014) indicating relatively poorly to well oxygenated conditions • Electrical conductivity ranged from 67.4 µS/cm (MW022) to 20,873 µS/cm (MW005) indicating fresh to saline conditions • pH ranged from 5.68 (MW020) to 8.92 (MW015) indicating slightly acidic to alkaline conditions • Corrected Redox ranged from 113 mV (MW043) to 320 mV (MW020) indicating reducing conditions.

5.2.1 PFAS Groundwater Analytical Results

The PFAS groundwater analytical results from this sampling event are presented in **Table T2** in **Appendix B**. In summary, PFAS compounds were reported at concentrations above the laboratory LOR in 64 of the 76 primary groundwater samples analysed. Concentrations of PFOS+PFHxS and/or PFOA exceeded the adopted human health criteria in 57 of the primary groundwater samples analysed.

Deviations from the historical dataset are provided in **Table 10** below and graphically on **Figure 6** in **Appendix A**.

Table 10 Deviations from Historical Groundwater Dataset

Deviation Type	Monitoring wells/bores	PFOS+PFHxS concentration (µg/L) May 2021	Historical maximum PFOS+PFHxS concentration (µg/L)	PFOA concentration (µg/L) May 2021	Historical maximum PFOA concentration (µg/L)
First time detections of PFOS+PFHxS and/or PFOA in groundwater	MW120	0.02	No historical data available	<0.01	No historical data available
	MW121	0.02	No historical data available	<0.01	No historical data available
First time exceedance of the NEMP (HEPA, 2020) drinking water guidelines	MW042	**0.194**	0.04	<0.02	<0.01

Legend	
Bold	Bold text indicates existing detection or exceedance of NEMP Human Health Screening Criteria
Blue Shading	Blue shading indicates sampling location with first time detection of PFOS+PFHxS and/or PFOA
Yellow Shading	Yellow shading indicates sampling location with first time exceedance of NEMP Human Health Screening criteria

5.2.2 Non-PFAS Groundwater Analytical Results

The non-PFAS groundwater analytical results from this sampling event are presented in **Table T2** in **Appendix B**.

5.3 Surface Water Observations and Field Measurements

Table 11 Surface Water Observations and Field Measurements

Compound	Criteria
Fieldwork Dates	The surface water sampling was completed between 4 and 7 May 2021.
Access and Sample Collection	All surface water sampling locations were accessible and able to be sampled.
Contamination Observations	No obvious visible signs of contamination were observed, with the exception of minor foam of unknown origin at SW001 and SW002.

Compound	Criteria
Geochemical Parameters	Surface water geochemical parameters were measured prior to collecting surface water samples. The stabilised readings are presented in **Table T1** in **Appendix B**, and are summarised below: • Dissolved oxygen ranged from 0.65 mg/L (SW016) to 9.23 mg/L (SW037) indicating relatively poorly oxygenated to well oxygenated conditions • Electrical conductivity ranged from 54.6 µS/cm (SW011) to 1789 µS/cm (SW018) indicating fresh to marginal conditions • pH ranged from 5.68 (SW014 and SW015) to 9.02 (SW037) indicating slightly acidic to alkaline conditions • Corrected redox ranged from 178.4 mV (SW037) to 416.7 mV (SW002) indicating reducing conditions.

5.3.1 PFAS Surface Water Analytical Results

The PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B**. In summary, PFAS compounds were reported at concentrations above the laboratory LOR in 21 of the 22 surface water samples analysed. Concentrations of PFOS+PFHxS and/or PFOA exceeded the adopted human health screening criteria in six of the 22 primary surface water samples analysed.

Deviations from the historical dataset are recorded in **Table 12** below and graphically on **Figure 7** in **Appendix A**.

Table 12 Deviations from Historical Surface Water Dataset

Deviation Type	Monitoring wells/bores	PFOS+PFHxS concentration (µg/L) May 2021	Historical maximum PFOS+PFHxS concentration (µg/L)	PFOA concentration (µg/L) May 2021	Historical maximum PFOA concentration (µg/L)
First time detections of PFOS+PFHxS and/or PFOA in surface water	SW018	0.94	0.08	0.04	<0.01
First time exceedance of the NEMP (HEPA, 2020) recreational use guidelines	SW014	**5.60**	1.37	0.17	0.03
	SW023	**2.47**	0.48	0.08	0.02
Legend					
Bold	Bold text indicates existing detection or exceedance of NEMP Human Health Screening Criteria				
Blue Shading	Blue shading indicates sampling location with first time detection of PFOS+PFHxS and/or PFOA				
Yellow Shading	Yellow shading indicates sampling location with first time exceedance of NEMP Human Health Screening criteria				

5.3.2 Non-PFAS Surface Water Analytical Results

The non-PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B**.

5.4 Sediment Sample Results

Table 13 Sediment Results and Observations

Compound	Criteria
Fieldwork Dates	The sediment sampling was completed between 4 and 7 May 2021.
Access and Sample Collection	All sediment sample locations were accessible with the exception of SD018 and SD023, which were not accessed due to bank instability issues.
Contamination Observations	No obvious visible signs of contamination were observed.

5.4.1 PFAS Sediment Analytical Results

The PFAS sediment analytical results from this sampling event are presented in **Table T4** in **Appendix B**. In summary, PFAS compounds were detected at concentrations above the laboratory LORs in 17 of the 19 primary sediment samples analysed.

Deviations from the historical dataset are recorded in **Table 14** and graphically on **Figure 8** in **Appendix A**.

Table 14 Deviations from Historical Sediment Dataset

Deviation Type	Sediment Sampling Location	PFOS+PFHxS concentration (µg/L) May 2021	Historical maximum PFOS+PFHxS concentration (µg/L)	PFOA concentration (µg/L) May 2021	Historical maximum PFOA concentration (µg/L)
First time detections of PFOS+PFHxS and/or PFOA in sediment	SD016	0.0086	0.004	0.0005	<0.0002
	SD019	0.0042	0.0032	0.0002	<0.0002
	SD020	0.006	<0.0002	<0.0002	<0.0002
Legend					
Blue Shading	Blue shading indicates sampling location with first time detection of PFOS+PFHxS and/or PFOA				

5.5 Historical Sampling Data

Historical groundwater, surface water and sediment sampling data are presented in **Tables T5**, **T6** and **T7** (respectively) in **Appendix B**.

6.0 Summary and Next Sampling Events

6.1 Summary of Monitoring Event

The biannual monitoring event was completed at the Site, publicly accessible land and private property within the Management Area between 3 and 7 May 2021. The program included:

- Groundwater gauging at 76 of 80 monitoring wells and bores. It is noted that four planned sampling locations could not be gauged
- Groundwater sampling at 76 of 80 monitoring wells and bores. It is noted that four planned sampling locations could not be sampled
- Surface water sampling at all 22 planned locations
- Sediment sampling at 19 of 21 planned locations. It is noted that two planned sediment sampling locations could not be sampled
- Collection of data from four surface water level loggers and seven groundwater level loggers. It is noted that data from one groundwater level logger could not be retrieved
- Collection of data from one barometric logger.

The **Table 15** below summarises the findings of the May 2021 sampling event and the recommended actions.

Table 15 Summary of Sampling Event

Item	Comment	Recommended Actions
Access to sampling locations	The following were accessed and able to be sampled: • 76 out of 80 monitoring wells and bores • 22 out of 22 surface water locations • 19 out of 21 sediment locations Groundwater samples from bores POT001 and POT002 could not be sampled as they had been decommissioned by the property owner. Due to bank instability issues caused by the recent flooding in March 2021, sediment sample locations SD018 and SD023 could not be accessed.	Given that private bores POT001 and POT002 have been decommissioned by the property owner, AECOM recommends their removal from the OMP. In their place, AECOM recommends sampling residential bores MW120 and MW121 during future sampling events. AECOM will attempt to access sediment locations SD018 and SD023 during the next scheduled sampling event.
Monitoring well network condition	Monitoring wells MW006 and MW099 were observed to have sustained damage during the recent flooding in March 2021 and the integrity of the wells appeared to have been comprised with surface water pooling above the open well casing and entering the well. The data logger installed in MW099 in November 2019 was not present within the damaged well at the time this monitoring event was undertaken.	AECOM recommends that MW006 and MW099 should be repaired and redeveloped prior to the next scheduled sampling event. Additionally, AECOM recommends that the missing data logger in MW099 be replaced with a new unit.
Analytical Results	PFAS was detected at concentrations above the laboratory LOR in 64 of the 76 groundwater samples, 21 of 22 surface water samples and 17 of 19 sediment samples analysed.	No actions recommended.

Item	Comment	Recommended Actions
First time exceedance of NEMP drinking water guideline values in groundwater	Concentrations of PFOS+PFHxS exceeded the NEMP drinking water criteria for the first time in monitoring well MW042.	Monitoring well will be sampled again during the November 2021 sampling event.
First time detection of PFOS+PFHxS and/or PFOA in groundwater	PFOS+PFHxS and/or PFOA was detected for the first time in groundwater at monitoring wells MW120 and MW121, noting that this was the first time that these wells have been sampled by AECOM.	Monitoring wells will be sampled again during the November 2021 sampling event.
First time exceedance of NEMP recreational guideline values in surface water	Concentrations of PFOS+PFHxS exceeded the NEMP recreational use criteria for the first time in surface water sampling locations SW014 and SW023.	Locations will be sampled again during the November 2021 sampling event.
First time detection of PFOS+PFHxS and/or PFOA in surface water	PFOA was detected for the first time in surface water at location SW018.	This location will be sampled again during the November 2021 sampling event.
First time detection of PFOS+PFHxS and/or PFOA in sediment	PFOS+PFHxS and/or PFOA was detected for the first time in sediment sample locations SD016, SD019 and SD020.	Locations will be sampled again during the November 2021 sampling event.

6.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for November 2021.

6.3 Upcoming Annual Interpretive Report

The next annual interpretive report is scheduled to be delivered in Q1 2022.

Notes

mBTOC	Meters below top of casing
mAHD	Meters Australian height Datum
mV	milliVolts
mg/L	milligrams per Litre
oC	degrees Celsius
µS/cm	micro Siemens per centremetre
Corrected field Redox measurement (Eh [mV]) = Er [mV] + 205.8	
NM	Not Measured
MW	Monitoring Well
SW	Surface Water
*	Not measured due to field equipment failure

Notes:

LOR	Limit of Reporting
Normal	Primary Sample
Field_D	Intra-laboratory duplicate sample
Interlab_D	Inter-laboratory duplicate sample
	Denotes first time detection above LOR for PFOS+PFHxS or PFOA
	Denotes new exceedence of human health screening criteria for PFOS+PFHxS or PFOA

Calibration & Service Report
Water Quality Meter

Company:	Active Environmental Solutions Hire	**Manufacturer:**	Heron	**Serial #:**	01- 7624
Address:	Unit 16, 191 Parramatta Road AUBURN NSW 2144	**Instrument/Model:**	H.OIL Interface Probe 30 m	**Tape Length:**	30m
Phone:	02 9716 5966 | **Fax**: 02 9716 5988	**Client Company:**		**Client Email:**	
Email:	hire@aesoultions.com.au	**Client Name:**		**Client Phone:**	

Equipment Check

30 m Heron Interface Probe

Customer:		**Manufacturer:**	Heron	
Contact:		**Instrument:**	H.OIL Interface Probe	
Order:		**Serial #:**	01-7624	
		Cable length:	30 m	
Item	**Test**	**Pass**	**Comments**	
Battery	Voltage (9v battery)	✓	Voltage above 7.9v	
	Fuses, circuit board	✓		
Probe	Decontaminated	✓		
	Condition	✓	Good, clean	
	Operation	✓	Responding	
Connectors	Condition	✓		
Tape Check	Decontaminated	✓		
	Checked for cuts	✓	Good condition	
Speaker	Operation	✓		
Light	Operation	✓		
Instrument Test	Water	✓	Surface level using tap water	
	Oil	✓	Surface level using Petrol and tap water	
This is to certify that the above instrument has been checked and is in good working order.				

Checked By: Milenko Sisic

Check Date: 23/04/2021 **Due for Check:** 23/10/2021

Item	Test	Pass	Comments
Battery	2 x Alkaline C-cells	✓	Voltage reading above 2.9V
	Battery Saver	✓	Automatically turns off after 60 minutes if not used
Connections	Condition	✓	Good, clean
Cable	Condition	✓	Clean, no tears
Display	Operation	✓	
Firmware	Version	✓	4.0.0
Keypad	Operational	✓	
Display	Screen	✓	
Unit	Condition, seals and O-rings	✓	
Monitor housing	Condition	✓	
pH			
Condition		✓	Good, clean
pH millivolts for pH7 calibration range 0 mV ± 50 mV		✓	
pH 4 mV range + 165 to + 180 from 7 buffer mV value		✓	
pH slope		✓	55 to 60 mV/pH; ideal 59mV
Response time < 90 seconds		✓

Analytical Data Validation

Appendix D Analytical Data Validation

DATA VALIDATION REPORT

Project number:	60612562	Validation by:	[redacted]	Date:	27/05/2021
Client:	Department of Defence				
Site:	RAAF Base Richmond				
Matrix type:	Soil / Groundwater / Surface Water	Data verified by:	[redacted]	Date:	28/05/2021
Primary samples:	19 Sediment samples / 76 Groundwater samples / 22 Surface water samples				
Laboratory:	ALS, NMI				
Lab reference:	ES2116724, ES2116725, ES2117172, ES2117098, ES2117089, AECO03_210511_RN1314562	Project Manager:	[redacted]		

Key Issues:	No issues were identified that have the potential to impact upon the reliability of the Data. AECOM considers that the field procedures and laboratory QA/QC processes employed were appropriate for the purposes of the investigation.

Field Quality Assurance and Quality Control

Field DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).
Sampling personnel	Sampling was conducted by Kurtis Wathen and Prerana Yerdhali between 3 and 7 May 2021. Field personnel were both suitably qualified and experienced AECOM Environmental Scientists
Sampling Methodology	The majority of groundwater samples were collected using pre-deployed 1.1L Hydrasleeves, with collected water deposited directly into laboratory prepared bottles. Grab samples were collected from monitoring wells MW045, MW033, MW074, MW120 and MW121 using dedicated, disposable bailers. The sample bottles were filled to the top, following laboratory instructions, caps immediately applied and stored on ice for preservation. Water quality parameters were collected down-well via a submerged water quality meter and were recorded once field values had stabilised. Surface water samples were either collected from directly beneath the surface to limit the infiltration of sediment into samples or using dedicated, disposable bailers where access was limited. Smaller vials were filled from larger sampling containers, to ensure preservative acids did not spill. The bottles were filled to the top, following laboratory instructions, caps immediately applied and stored on ice for preservation. Sediment samples were collected using a trowel and deposited directly into laboratory prepared containers. The containers were filled to the top, following laboratory instructions, and stored on ice for preservation. After each sampling at each location, the water quality meter and interface probe were decontaminated using Liquinox and the consumables (nitrile gloves, hydrasleeves™ and/or bailers) were disposed of.
Chain of Custody (COC)	All samples taken were reported on the Chain of Custody documents (COC) and subsequent email amendments analysed for requested analytes.
Rinsate Blank	Rinsate blank samples were collected at a frequency of one per day of sampling (five in total). All rinsates were collected from the final rinse of the interface probe. The results of the rinsate analysis indicated that concentrations of PFAS were below the limit of reporting (LOR) for all analytes tested. Rinsate results are presented in Table D1 in Appendix D.

Frequency of field QC	Field duplicate and triplicates (inter-laboratory duplicates) were to be collected at a frequency of one in twenty primary samples (5%). In total, five field duplicates were collected for water samples (5.1%), and one field duplicate for sediment (5.26%) were collected, meeting the DQI. Five inter-laboratory duplicates were collected for water samples (5.1%), and one triplicate for sediment (5.26%) were collected, meeting the DQI.
Handling and preservation	Primary and duplicate samples for groundwater, surface water and sediment were placed in a chilled cooler between sampling and analysis. Samples were received preserved and chilled at the laboratory, with all containers received within the recommended temperature range (4 ± 2°C) with the exception of batch ES2117172 which was received at 0.2°C. While the received temperatures were marginally below the recommended range, they are not considered to impact upon the reliability of the results. The inter-laboratory duplicate samples were received at the secondary laboratory (NMI) within the recommended temperature range (4 ± 2°C). All samples were received at the laboratory in appropriate sample containers.
Calibration of equipment	Measurement of groundwater geochemical parameters was undertaken using the YSI WQM Professional Plus, which was calibrated by the supplier prior to use, in accordance with manufacturer's instructions and "bump tested" in the field at the beginning of each sampling day Measurement of depth to groundwater was undertaken by an interface probe, which was serviced by the supplier AES prior to use. All calibration and service certificates are presented in Appendix C.
Laboratory QA/QC	
Laboratory DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).
Tests requested/reported	All primary water samples were analysed for the Per- and Polyfluoroalkyl Substances (PFAS) extended suite, with approximately 20% of all samples analysed for nutrients (ammonia, nitrate, nitrite, phosphorous) and metals (aluminium, bromine, iron, manganese). All primary sediment samples were analysed only for the PFAS extended suite. All sample request of analysis was reported on the Chain of Custody (COC). Confirmation of results were requested and adopted for the below samples; • 0902_MW042_210503 • 0902_MW120_210504 • 0902_MW121_210504 • 0902_SW018_210506 • 0902_SW023_210506 • 0902_SW014_210506 • 0902_QC102_210506 • 0902_QC104_210506 • 0902_SD016_210505 • 0902_SD020_210507 • 0902_SD019_210507
Holding time compliance	All samples were extracted and analysed within recommended holding times.
Laboratory	The primary laboratory was ALS Environmental Pty Ltd (Sydney) a National Association of Testing Authorities (NATA) accredited laboratory (Accreditation No. 825). The secondary laboratory used for the project was National Measurement Institute (NMI,

	Sydney), also a NATA accredited laboratory (accreditation number 198). All analysis was completed using NATA accredited methods.
Frequency of laboratory QC	The primary laboratory (ALS), reported a sufficient frequency of quality control samples with the exception of Duplicates and Matrix Spikes for the following workorders ; Laboratory Duplicates ES2116725 • PFAS: Actual 0.00 Expected 10.00 ES2117098 • PFAS: Actual 7.55 Expected 10.00 Matrix Spike ES2116725 • PFAS: Actual 0.00 Expected 5.00 The accuracy of the data can be assessed as acceptable based on method blank, laboratory duplicates, LCS recoveries, which were reported at or above the required frequencies and within control limits.
Method Blank	All method blank concentrations were reported <LOR for the analytes tested from the primary laboratory, ALS. This is presented in the laboratory Quality Control Report.
Laboratory duplicate RPDs	The reported laboratory duplicate Relative Percentage Differences (RPD) were within laboratories control limits. The laboratory duplicate RPDs are presented in the laboratory Quality Control Report.
Laboratory control spike recovery	The reported laboratory Control Spikes (LCS) recoveries were within the laboratories control limits. This is presented in the laboratory Quality Control Report.
Matrix spike recovery	The reported laboratory Matrix Spike (MS) recoveries were within the laboratory control limits for PFAS analytes with the exception of a number of PFAS compounds in batches ES2116725, ES2117172, ES2117098, and nutrients analytes in batches ES2116725, ES2117172 where the MS recovery was not determined due to background levels being greater than or equal to 4x spike level. Given the low limits of reporting for these PFAS compounds, AECOM is of the opinion that this would not significantly impact upon the reliability of the data. Matrix Spike recovery was less than the lower data quality objective for the following in report ES2117098 • 8:2 Fluorotelomer sulfonic acid (8:2 FTS) – 62% (65.0-137%) • 10:2 Fluorotelomer sulfonic acid (10:2 FTS) – 61.6% (69.2-143%) The ALS technician has accepted this quality control run, as all other compounds passed. Additionally, it was noted that most of the compounds were on the lower side of recovery percent, and that this test was not performed on an AECOM sample, rather an anonymous sample on the same instrument.
Surrogate spike recovery	The reported surrogate spike recoveries were within laboratory control limits (60% - 120%), with the exception of PFAS in ES2117172 which was reported less than the lower data quality objective at 50%. When high concentrations of particular PFAS compounds occur, surrogates can be suppressed and difficult to differentiate when observing peaks. In this case the Perfluorodecanoic acid (PFDA), Perfluoroundecanoic acid (PFUnDA), and Perfluorododecanoic acid (PFDoDA) compounds were high and dilution was required,

	possibly suppressing the surrogate peaks/observable recovery. This is often the case with impacted samples. AECOM is of the opinion that this would not significantly impact upon the reliability of the data.
QA/QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.
Data transcription	A check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted human health screening levels and were consistent with Defence (2018) Standard PFAS Analytical Suite requirements. It is noted that the LORs for PFAS compounds were greater than the adopted 99% freshwater ecosystem protection values adopted as ecological screening criteria.
Field duplicate and Triplicate RPDs	Water Field duplicate RPDs were reported within the DQIs, with the exception of a number of PFAS analytes for water sample duplicate pairs exceeded the DQI with RPDs ranging between 32% and 115% (refer to **Table D2**): Sediment Field duplicate RPDs were reported within the DQIs, with the exception of a number of PFAS analytes for sediment sample duplicate pairs exceeded the DQI with RPDs ranging between 34% and 150% (refer to **Table D3**) The RPD exceedances were largely attributed to the low concentrations of PFAS compounds reported in the primary and duplicate samples which were noted generally to be within the same order of magnitude for each duplicate pair. Given that the primary and duplicate samples were all within the same concentrations range for the applicable guideline criteria (where available), AECOM does not consider that these RPD exceedances impact upon the reliability of the data. Water and Sediment Duplicate RPD results are presented in Tables D2 and D3 (respectively) in Appendix D.
Overall Assessment	
	Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

D1 - Rinsate Results

*RPDs have only been considered where a concentration is greater than 1 times the LOR.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each LOR multiplier range are: 30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory
nc = non calcluable as one or both results are <LOR

*RPDs have only been considered where a concentration is greater than 1 times the LOR.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each LOR multiplier range are: 30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

CERTIFICATE OF ANALYSIS

Work Order	: **ES2116724**	Page	: 1 of 10
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Contact	: Christopher Redford
Address	: LEVEL 21 420 GEORGE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 05-May-2021 14:00
Order number	: 5.1	Date Analysis Commenced	: 06-May-2021
C-O-C number	: 22332	Issue Date	: 13-May-2021 14:16
Sampler	: MAT JENKINS, PRERANA YERDHALLI		
Site	: Private property		
Quote number	: SY/139/19 v4_NSW_0902_PFASOMP		
No. of samples received	: 4		
No. of samples analysed	: 4		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: PFOS result for samples #1 and #2 confirmed by re-extraction and re-analysis.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **SAMPLE 5: MW021 (05/05/2021) was received extra and placed on hold.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Total Metals by ICP-MS - Suite A : EG020A-T		
0902_SW032_210504	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Unfiltered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Subject: FW: [EXTERNAL] - Incoming batches with a short holding time

Hi Fadi,

We will have 2 Compass batches coming in via courier today:

22352 – 54 samples
22332 – 4 samples

A few notes for SR:

- Please be aware that both of these batches have samples for Nitrites and Nitrates which have a short holding time
- The TAT for these batches is standard time (5 days)
- The sediment bottles not scanned, filled out the containers manually, so although the app has these as not collected
- 2 samples on hold
- Upon arrival please let me know what bottles have been received for these two samples.
  - 0902_MW081_210304
  - 0902_SW023_210304
- For sample 0902_MW009_210303 there may be limited volume. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Please let me know if there are any issues or questions.

Kind Regards,

Angus Harding

Subject: [EXTERNAL] - Incoming batches with a short holding time

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hey Team,

We have two batches coming in today, for project NSW_0902_PFASOMP (not PFASMGMT), which has just been picked up by the courier. Please ensure these remain separate workorders.

These are for ALS compass COC

22352 – 54 samples
22332 – 4 samples

Please be aware that both of these batches have samples for **Nitrites and Nitrates** which have a short holding time. Please log these as soon as possible.
The TAT for these batches is standard time (5 days)
The sediment bottles were a struggle to scan, so the team has had to fill out the containers manually. So although the app has these as not collected, these are present

I have placed the below two samples on hold, I will let you know whether we would like these analysed for PFAS full suite. Upon arrival please let me know what bottles have been received for these two samples.

0902_MW081_210304
0902_SW023_210304

For sample 0902_MW009_210303 I do not believe that there was sufficient water to collect all requested analysis from the COC. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Cheers, and let me know if any issues

Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2116724**	Page	: 1 of 8
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 05-May-2021
Site	: Private property	Issue Date	: 13-May-2021
Sampler	: MAT JENKINS, PRERANA YERDHALLI	No. of samples received	: 4
Order number	: 5.1	No. of samples analysed	: 4

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Pabi Subba	Senior Organic Chemist	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Particular samples required dilution due to sample matrix . LOR values have been adjusted accordingly.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EP231X: Positive results for analytes Perfluorobutane sulfonic acid (PFBS) & Perfluorohexane sulfonic acid (PFHxS) on sample ES2116725_049 (0902_QC100_210503) have been confirmed by re-extraction & re-analysis.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

Dates

Date Samples Received	: 05-May-2021 14:00	Issue Date	: 05-May-2021
Client Requested Due Date	: 12-May-2021	Scheduled Reporting Date	: **12-May-2021**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: ----	Temperature	: 5.9 - Ice present
Receipt Detail	:	No. of samples received / analysed	: 54 / 54

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Fadi Soro

From: Angus Harding
Sent: Wednesday, 5 May 2021 11:03 AM
To: Fadi Soro
Cc: Helen Simpson; Wael Saleh; Christopher Redford
Subject: FW: [EXTERNAL] - Incoming batches with a short holding time

Hi Fadi,

We will have 2 Compass batches coming in via courier today:

22352 – 54 samples
22332 – 4 samples

A few notes for SR:

- Please be aware that both of these batches have samples for Nitrites and Nitrates which have a short holding time
- The TAT for these batches is standard time (5 days)
- The sediment bottles not scanned, filled out the containers manually, so although the app has these as not collected
- 2 samples on hold
- Upon arrival please let me know what bottles have been received for these two samples.
  - 0902_MW081_210304
  - 0902_SW023_210304
- For sample 0902_MW009_210303 there may be limited volume. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Please let me know if there are any issues or questions.

Kind Regards,

Angus Harding

Subject: [EXTERNAL] - Incoming batches with a short holding time

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hey Team,

We have two batches coming in today, for project NSW_0902_PFASOMP (not PFASMGMT), which has just been picked up by the courier. Please ensure these remain separate workorders.

These are for ALS compass COC

22352 – 54 samples

I have placed the below two samples on hold, I will let you know whether we would like these analysed for PFAS full suite. Upon arrival please let me know what bottles have been received for these two samples.

0902_MW081_210304
0902_SW023_210304

For sample 0902_MW009_210303 I do not believe that there was sufficient water to collect all requested analysis from the COC. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Cheers, and let me know if any issues

To: Fadi Soro
Cc: Helen Simpson; Wael Saleh; Christopher Redford
Subject: FW: [EXTERNAL] - Incoming batches with a short holding time

Hi Fadi,

We will have 2 Compass batches coming in via courier today:

22352 – 54 samples
22332 – 4 samples

A few notes for SR:

- Please be aware that both of these batches have samples for Nitrites and Nitrates which have a short holding time
- The TAT for these batches is standard time (5 days)
- The sediment bottles not scanned, filled out the containers manually, so although the app has these as not collected
- 2 samples on hold
- Upon arrival please let me know what bottles have been received for these two samples.
  - 0902_MW081_210304
  - 0902_SW023_210304
- For sample 0902_MW009_210303 there may be limited volume. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Please let me know if there are any issues or questions.

Kind Regards,

Angus Harding

Subject: [EXTERNAL] - Incoming batches with a short holding time

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hey Team,

We have two batches coming in today, for project NSW_0902_PFASOMP (not PFASMGMT), which has just been picked up by the courier. Please ensure these remain separate workorders.

These are for ALS compass COC

22352 – 54 samples

I have placed the below two samples on hold, I will let you know whether we would like these analysed for PFAS full suite. Upon arrival please let me know what bottles have been received for these two samples.

0902_MW081_210304
0902_SW023_210304

For sample 0902_MW009_210303 I do not believe that there was sufficient water to collect all requested analysis from the COC. PFAS has been prioritised, with metals collected, hopefully it will be enough.

Cheers, and let me know if any issues

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2116725**	Page	: 1 of 13
Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 05-May-2021
Site	: 5/5/2021	Issue Date	: 20-May-2021
Sampler	: MAT JENKINS, PRERANA YERDHALLI	No. of samples received	: 55
Order number	: 5.1	No. of samples analysed	: 55

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	1	4	25.00	10.00	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2117089**	Page	: 1 of 6
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 06-May-2021
Site	: Batch 2	Issue Date	: 17-May-2021
Sampler	: MAT JENKINS, PRERANA YERDHALLI	No. of samples received	: 2
Order number	: 5.1	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis		
		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.

Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Poor Matrix spike recovery due to matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EK057G/EK059G:LOR raised for Nitrite and NOx due to sample matrix.
- Amendment (27/05/2021): This report has been amended as a result of a client request to change PFAS data for method code EP231, samples #27, 32, 42, 46, 48.
- Amendment (28/05/2021): This report has been amended following a change to the EP231X: PFAS result reported for all samples as per request from AECOM, reported results take from a secondary analysis to confirm results. PFAS results are consistent with the original reported results.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Changed sample date on Samples 021, 038 and 049 as per client.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Sample 0902_MW036_210505 was not received due to the following reason: sample not received
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2117098**	Page	: 1 of 14
Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 06-May-2021
Site	: Batch 2	Issue Date	: 28-May-2021
Sampler	: MAT JENKINS, PRERANA YERDHALLI	No. of samples received	: 50
Order number	: 5.1	No. of samples analysed	: 49

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231D: (n:2) Fluorotelomer Sulfonic Acids	ES2117038--009	Anonymous	**8:2 Fluorotelomer sulfonic acid (8:2 FTS)**	39108-34-4	62.0 %	65.0-137%	**Recovery less than lower data quality objective**
EP231D: (n:2) Fluorotelomer Sulfonic Acids	ES2117038--009	Anonymous	**10:2 Fluorotelomer sulfonic acid (10:2 FTS)**	120226-60-0	61.6 %	69.2-143%	**Recovery less than lower data quality objective**

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2117098--005	0902_MW015_210506	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	4	53	7.55	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / ***Container*** / Client Sample ID(s)	***Sample Date***	*Extraction / Preparation*			*Analysis*		
		Date extracted	*Due for extraction*	*Evaluation*	***Date analysed***	*Due for analysis*	*Evaluation*

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of samples received	: 20		
No. of samples analysed	: 18		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- Amendment (28/05/2021): This report has been amended following a change to the EP231X: PFAS result reported for all samples as per request from AECOM, reported results take from a secondary analysis to confirm results. PFAS results are consistent with the original reported results.
- Amendment (27/05/2021): This report has been amended as a result of a client request to change PFAS data for method code EP231, samples #9, 10.
- Amendment (25/05/2021):This report has been amended following the removal of incorrect sample descriptions. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

Receipt Detail	:	No. of samples received / analysed	: 20 / 18

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Changed sample dates for Samples 001, 003 and 015 as per client.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Quote number	: SY/139/19 v4_NSW_0902_PFASOMP		
No. of samples received	: 20		
No. of samples analysed	: 18		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2117172**	Page	: 1 of 9
Amendment	: **2**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 07-May-2021
Site	: Richmond	Issue Date	: 28-May-2021
Sampler	: MAT JENKINS, PRERANA YERDHALLI	No. of samples received	: 20
Order number	: 5.1	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2116239--095	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP231S: PFAS Surrogate	ES2117172-018	0902_QC107_210507	**13C4-PFOS**	----	50.0 %	60.0-120 %	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

N21/011801
PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

LOR values for sample N21/011801 were raised due to the low solid contentô in the sample.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program at the RAAF Base Richmond (the 'Site') in the NSW and Jervis Bay Region. The location of the Site and Management Areas are shown in **Figure 1** in **Appendix A**.

The Ongoing Monitoring Plan (OMP) (Defence, 2019a) for the Site outlines the requirement to complete biannual groundwater, surface water and sediment sampling.

Following each sampling event, a sampling event factual report is prepared. Annual interpretative reports will be prepared following the completion of each 12-month sampling period. This Sampling Event Factual Report has been prepared to report the results of the biannual sampling event completed in November and December 2021, specifically highlighting first time detections and/or first-time exceedances of human health and/or ecological screening criteria for Perfluorooctanesulfonic acid (PFOS) + Perfluorohexanesulfonic acid (PFHxS) and/or Perfluorooctanoic acid (PFOA).

This reported has been prepared in accordance with the Defence *PFAS OMP Factual Report Guidance,* Version 0.2 dated May 2021 (Defence, 2021).

1.2 Objectives

The objectives of the OMP program are to:

- implement the OMP (Defence, 2019a) prepared as part of the Detailed Environmental Investigations; and
- collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport and transformation of PFAS within the Management Areas.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2019b).

The objective of this phase of the project is to implement the scope of works for the November 2021 sampling event in accordance with the Sampling and Analysis Quality Plan (SAQP) (AECOM, 2021).

2.0 Scope of Work

2.1 Summary of Scope

The biannual sampling event was completed in general accordance with the SAQP (AECOM, 2021). In summary, the scope of works completed included:

- obtaining permission (where required) to conduct works at the Site, off-site publicly accessible areas and privately owned properties
- gauging of groundwater levels in monitoring wells prior to collection of samples (refer to **Table 1** below, and **Figure 2** in **Appendix A** for specific locations)
- collection of groundwater samples from 88 existing monitoring wells using either HydraSleeves™ or dedicated, disposable bailers (refer to **Table 1** below, and **Figure 2** in **Appendix A** for specific locations). It is noted that samples from four monitoring locations could not be collected during this sampling event (refer to **Table 8** for more details)
- collection of 22 surface water samples (refer to **Table 2** below, and **Figure 3** in **Appendix A** for specific locations). It is noted that surface water samples from one location could not be collected during this sampling event (refer to **Table 10** for further details)
- collection of 21 sediment samples (refer to **Table 3** below, and **Figure 4** in **Appendix A** for specific locations). It is noted that a sediment sample from one location could not be collected during this sampling event (refer to **Table 11** for further details)
- collection of field duplicate samples at a rate of 1 in 10 primary samples and collecting one rinsate sample per fieldwork day
- analysis of samples for the following:
  - all samples for the PFAS suite at the standard limit of reporting (LOR).
  - 20% of groundwater and surface water samples for nutrients (ammonia, nitrate, nitrite, phosphorous) and selected metals (aluminium, bromide, iron and manganese)
- data management of the OMP field and laboratory data in Defence ESdat database
- preparation of this Sampling Event Factual Report.

2.2 Planned Monitoring Locations

The monitoring locations outlined within the SAQP (AECOM, 2021) for the planned biannual groundwater, surface water and sediment sampling events are outlined in **Table 1**, **Table 2** and **Table 3** below.

Table 1 Groundwater Sampling Locations

Area	Description	Sampling Locations	Number of wells/ bores	Total
On-Site	West of Site (including Airfield Former Fire Ground/Training Ground)	MW008, MW009, MW010, MW040, MW041, MW117, MW118, MW119	8	75 Locations
	Airfield Foam Cannon Testing Area and Surrounds	MW030, MW053, MW054, MW056, MW057, MW058, MW059, MW107D, MW107I, MW108	10	
	Airfield Flight Line (including Fire Station, Building 291)	MW007, MW024, MW025, MW026, MW027, MW028, MW042, MW043	8	

Area	Description	Sampling Locations	Number of wells/ bores	Total
	Site Infrastructure (including Hangar 54)	MW044*, MW045*, MW046, MW060, MW061, MW062, MW063, MW064, MW065, MW066, MW067, MW068, MW069, MW070, MW071	15	
	East of Site (including Tanker Parking Area and Former Fuel Farm 1)	MW047, MW048, MW050, MW051, MW052, MW072, MW073, MW074	8	
	Sewage Treatment Plant and Surrounds	MW020, MW021, MW022, MW023, MW036, MW109, MW110	7	
	Fuel Farm 2	MW032, MW033, MW034	3	
	Rickabys Drop Zone	MW001, MW002, MW004, MW005, MW006*, MW012, MW013, MW014, MW015, MW016, MW017, MW095, MW111, MW112, MW113, MW114	16	
Off-Site	West of Site	MW075, MW076, MW077, MW078, MW081	5	17 Locations
	North west of Site	MW079, MW080, MW082, MW106, MW120, MW121	6	
	North East of Site	MW097, MW098, MW099*	3	
	East of Site	MW086, MW091, MW092	3	

Note: *Location not sampled. Refer to **Table 4** for further details

Table 2 Surface Water Sampling Locations

Area	Description	Sampling Locations	Number of Locations	Total
On-Site	North west of Site (including STP discharge point)	SW001, SW002, SW003, SW037	4	11 Locations
	North east of Site (including tributary of Rickabys Creek)	SW005, SW007, SW014	3	
	East of Site (including Rickabys Creek)	SW008, SW009, SW011, SW013	4	
Off-Site	West of Site	SW022, SW024, SW035	3	12 Locations
	North of Site	SW015, SW016, SW032, SW081*	4	
	East of Site	SW018, SW019, SW023, SW030	4	
	South of Site	SW020	1	

Note: *Location not sampled. Refer to **Table 4** for further details

Table 3 Sediment Sampling Locations

Area	Description	Sampling Locations	Number of Locations	Total
On-Site	North west of Site (including STP discharge point)	SD001, SD002, SD003	3	10 Locations
	North east of Site (including tributary of Rickabys Creek)	SD005, SD007, SD014	3	
	East of Site (including Rickabys Creek)	SD008, SD009, SD011, SD013	4	
Off-Site	West of Site	SD022, SD024, SD035	3	12 Locations
	North of Site	SD015, SD016, SD032**,** SD081*	4	
	East of Site	SD018, SD019, SD023, SD030	4	
	South of Site	SD020	1	

Note: *Location not sampled. Refer to **Table 4** for further details

3.0 Deviations from the SAQP

The November 2021 sampling event was completed in general accordance with the SAQP (AECOM, 2021) with the exception of the deviations outlined in **Table 4** below.

Table 4 Deviations from SAQP (AECOM, 2021)

SAQP	November 2021 Sampling Event
92 groundwater locations are identified to be sampled as part of the biannual sampling event	Monitoring wells MW006 (located in Rickabys Drop Zone) and MW099 (located off-site along Cupitts Lane) were observed to have been destroyed. No samples were able to be collected. Monitoring wells MW044 and MW045 (located on base) were located underneath stockpiles of construction material and therefore were not able to be accessed for sampling. AECOM does not consider the lack of sampling from these locations to constitute a significant data gap as the existing monitoring well network provides sufficient coverage of these locations. AECOM will attempt to resample MW044 and MW045 during the next scheduled sampling event in May 2022.
Groundwater samples are to be collected using HydraSleeves™ deployed prior to the sampling event	Groundwater samples MW007, MW009, MW072, MW074, MW120 and MW121 were collected using dedicated disposable bailers as HydraSleeves™ were either not present, did not deploy appropriately or insufficient water was available. AECOM will attempt to resample the wells using HydraSleeves™ during the next scheduled sampling event in May 2022. As the concentrations of PFAS reported in these samples were either within the historical range for each location, or within the same order of magnitude of historical results, the change in sampling methodology is not considered to impact upon the reliability of the data for the purposes of the OMP.
20% of groundwater and surface water samples for nutrients (ammonia, nitrate, nitrite, phosphorous) and selected metals (aluminium, bromide, iron and manganese)	Due to a low volume of groundwater being present in location MW009, it was only analysed for PFAS, rather than the proposed broader suite. As a result, only 17.2% of samples were analysed for the expanded suite, rather than the target 20%. Given that the actual rate was only marginally lower than the target rate of 20%, AECOM considers that the data collected are sufficiently representative for the purposes of the OMP.
23 surface water locations are identified to be sampled as part of the biannual sampling event	AECOM was unable collect a sample from proposed surface water location SW081 as the road was closed due to council road rectification works following the damage sustained during significant flood event in March 2021. Concentrations of PFAS in surface water at this location remain a data gap as this location has not been sampled previously. AECOM will attempt to collect a sample from the location again during the next scheduled OMP sampling event in May 2022.

SAQP	November 2021 Sampling Event
22 sediment locations are identified to be sampled as part of the biannual sampling event	AECOM was unable collect a sample from proposed sediment location SD081 as the road was closed due to council road rectification works following the damage sustained during a significant flood event in March 2021. Concentrations of PFAS in sediment at this location remain a data gap as this location has not been sampled previously. AECOM will attempt to collect a sample from the location again during the next scheduled OMP sampling event in May 2022.
Surface water samples are to be collected by lowering a laboratory supplied container into the water with the cap immediately applied once the container is full.	Due to access considerations, the surface water sample from SW037 was collected using a dedicated disposable bailer. As the concentrations of PFAS reported in this sample were within the historical range for this location, the change in sampling methodology is not considered to impact upon the reliability of the data for the purposes of the OMP.

4.0 Methodology

4.1 Sampling Methodology

The methodology adopted for the November 2021 biannual sampling event was in general accordance with the SAQP (AECOM, 2021) and summarised in **Table 5** below:

Table 5 Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater (in metres below top of casing [mbtoc]) was measured in each monitoring well immediately prior to collection of groundwater samples using an interface probe, with the exception of MW006, MW044, MW045 and MW099. MW006 and MW099 were observed to have been destroyed, while MW044 and MW045 had been covered by stockpiles of construction materials.
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all groundwater and surface water samples with the exception of locations where wells were destroyed or unable to be accessed (MW006, MW044, MW045, MW099 and SW081). Field parameters were collected using a calibrated water quality meter (WQM), with equipment supplier and field calibration records provided in **Appendix C**.
Sampling methodology	Groundwater samples were collected from the majority of monitoring wells using no-purge methodology (i.e., HydraSleeves™), which were installed within the screened interval of the wells greater than 24hrs prior to the sampling round. Installation depths were based on a review of the well construction logs. Once sampling was completed, new HydraSleeves™ were deployed in the majority of monitoring wells at the screened interval depth in preparation for the next sampling round. Groundwater samples at MW007, MW009, MW072, MW074, MW120 and MW121 were collected using dedicated disposable bailers as HydraSleeves™ were either not present or did not deploy appropriately. The majority of surface water samples were collected by lowering a laboratory supplied container below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container was lowered into the water with the cap immediately applied once the container was full. At SW037, the sample was collected using a dedicated disposable bailer, before being decanted into laboratory supplied bottles. SW081 was unable to be accessed during the monitoring event and therefore no sample could be collected. Sediment samples were collected using a trowel from the base of the drain. At each location, a new laboratory supplied container was used to collect the sample. The trowel was decontaminated between sampling locations using a PFAS-free detergent (Liquinox®) followed by a double rinse with laboratory supplied de-ionised, PFAS free water. SD081 was unable to be accessed during the monitoring event and therefore no sample could be collected.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e., splits) and rinsate samples. Refer to **Appendix D** for assessment of QA/QC sample data.

Item	Details
Sample analysis	Samples were submitted to the primary and secondary laboratories for analysis detailed in **Section 2.0**. ALS Environmental (ALS) Sydney, NSW was used as the primary laboratory. The Envirolab of Sydney, NSW was used as the secondary laboratory. ALS and Envirolab methods for analyses were certified by the National Association of Testing Authorities (NATA). Laboratory certificates are presented in **Appendix E**.

4.2 Adopted Screening Criteria

Adopted screening criteria reference national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- PFAS National Environmental Management Plan 2.0 (NEMP), (HEPA 2020) (https://www.environment.gov.au/protection/publications/pfas-nemp-2)
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (FSANZ 2017).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC 2019).
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM).

The adopted screening criteria are presented in **Table 6** below.

Table 6 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment/Reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values presented in the PFAS NEMP, 2020 are from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the TDI for PFOS and PFOA from FSANZ, 2017 and the methodology described in Chapter 6.3.3 of the National Health and Medical Research Council's (NHMRC) Australian Drinking Water Guidelines (ADWG), 2016 to determine drinking water values. For PFHxS, DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'.
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	In August 2019, NHMRC released guidance on the assessment of PFAS in surface water. Rather than adopting an ingestion rate of 0.2 L of water per day (as per the ADWG formula), NHMRC adjusted this rate with consideration of an event frequency (150 events/year) to calculate an annual ingestion rate of 30 L per year.
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	The values are from the PFAS NEMP, 2020 which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality – draft default guideline values. AECOM understands that these guidelines are currently being reviewed and will consider the appropriateness of considering any future revision. The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value.
	PFOA	19 µg/L	

4.3 Data Quality Objectives and Data Validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).

The data validation assessment is provided in **Appendix D**.

Data validation employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event have been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) requirements.

5.0 Field Observations and Results

5.1 General Field Observations

The field observations noted during the sampling event are summarised in **Table 7** below.

Table 7 General Field Observations

Items	Observations
Weather Conditions	During the November 2021 sampling event, the weather in general was observed to be overcast with light to heavy precipitation and cool to moderate temperature with a maximum daily temperature of 28.1°C recorded on Wednesday 24 November 2021. 82.4 mm of rainfall was recorded between 22 and 26 November 2021 at RAAF Base Richmond (Richmond RAAF NSW, 067105) (Bureau of Meteorology, 2021).
Estate Management Works or Training Activities	During the sampling event, the following notable estate works were observed in the vicinity of the sampling locations: • tank refurbishments being completed at the Sewage Treatment Plant. The works were being undertaken by Baseline Projects. No training activities were observed in the vicinity of the sampling locations during the event.

5.2 Groundwater Observations and Results

5.2.1 Groundwater Observations and Field Measurements

Groundwater observations and field measurements recorded during the sampling event are presented in **Table 8** below.

Table 8 Groundwater Observations and Field Measurements

Compound	Criteria
Fieldwork Dates	The groundwater sampling was completed between 22 and 29 November and 14 December 2021.
Access and Sample Collection	All monitoring wells and bores were accessible and able to be sampled with the exception of the following: • monitoring wells MW006 and MW099 were observed to be destroyed and could not be sampled. • monitoring wells MW044 and MW045 were observed to be covered by soil stockpiles and could not sampled.
Monitoring Well Network Condition	Monitoring wells MW006 and MW099 were observed to have been destroyed. Monitoring wells MW117, MW118 and MW119 were observed to be missing well caps, with surface water infiltration observed. Based on these observations, and that concentrations of PFAS reported in these locations were up to eight times higher than historical results, AECOM considers that the integrity of these wells has likely been compromised. New well caps were installed following the November 2021 sampling event. The stabilised water level within MW098 was observed to be at the ground surface and the gatic was noted to be damaged. These observations suggest that the integrity of the monitoring well may be compromised, however the concentrations of PFAS reported were consistent with historical results (below the laboratory LOR).
Contamination Observations	No visible indications of contamination were observed during the sampling.
Depth to Groundwater and flow direction	Excluding monitoring wells MW098, MW117, MW118 and MW119 (which are likely to have been subject to surface water ingress) the depth to groundwater ranged from 0.123 (MW013) and 17.676 (MW054) m btoc. Groundwater elevations in the aquifer were between 3.08 (MW092) and 15.477 (MW071) metres Australian Height Datum (m AHD). Groundwater gauging data is presented in **Table T1** in **Appendix B**. Inferred groundwater contours and groundwater flow directions at the site in November 2021 are shown on **Figure 5** in **Appendix A**. The inferred local groundwater flow direction for the regional shallow (unconfined) aquifer is towards the north and northeast towards the Hawkesbury River with mounding observed in the eastern corner of the Site in the vicinity of the fuel farm, which was generally consistent with the DSI (AECOM, 2018) and flow directions observed during previous PFAS OMP monitoring events. Gauging data from MW098, MW117, MW118 and MW119 were excluded from the groundwater elevation plan given that they were likely subject to surface water ingress. Furthermore, thirteen additional locations (MW070 to MW072 and MW106 to MW116) were excluded from the contour plan due to the wells either being screened in perched water, or screened in deep groundwater within the underlying bedrock. Additionally, it is noted that the groundwater elevation plan has been prepared based on gauging data collected between 22 and 29 November 2021 during which 82.4 mm of rainfall was recorded. Therefore, while the elevation plan is generally consistent with previous groundwater elevation plans, there is the potential that the rainfall event may have influenced the elevations in the plan, particularly in the low-lying areas (i.e Rickabys Drop Zone and surrounds).

Compound	Criteria
Geochemical Parameters	Groundwater geochemical parameters were measured prior to collecting groundwater samples. The stabilised readings are presented in **Table T1** in **Appendix B**, and are summarised below: • dissolved oxygen ranged from 0.12 mg/L (MW015) to 5.30 mg/L (MW023) indicating poorly to moderately well oxygenated conditions • electrical conductivity ranged from 145.8 µS/cm (MW050) to 20,200 µS/cm (MW005) indicating fresh to saline conditions • pH ranged from 5.60 (MW060) to 7.90 (MW028) indicating slightly acidic to slightly alkaline conditions • corrected Redox ranged from 58.0 mV (MW121) to 402.9 mV (MW070) indicating reducing conditions.

5.2.2 PFAS Groundwater Analytical Results

The PFAS groundwater analytical results from this sampling event are presented in **Table T2** in **Appendix B**.

In summary, PFAS compounds were reported at concentrations above the laboratory LOR in 75 of the 88 primary groundwater samples analysed. Concentrations of PFOS+PFHxS and/or PFOA exceeded the adopted human health criteria in 65 of the primary groundwater samples analysed. Concentrations of PFOS and/or PFOA exceeded the adopted ecological screening criteria in 69 of the primary groundwater samples analysed.

Deviations from the historical dataset are provided in **Table 9** below and graphically on **Figure 6** in **Appendix A**.

Table 9 Deviations from Historical Groundwater Dataset

Deviation Type	Location ID	PFOS+PFHxS concentration (µg/L)		PFOS concentration (µg/L)		PFOA concentration (µg/L)	
		Nov 2021	Historical maximum	Nov 2021	Historical maximum	Nov 2021	Historical maximum
First time detections of PFOS+PFHxS and/or PFOA in groundwater	No first time detections of PFOS+PFHxS and/or PFOA were reported during the current sampling event.						
First time exceedance of the NEMP (HEPA, 2020) drinking water guidelines	MW078	**0.19**	0.02	0.01	<0.01	<0.01	<0.01
First time exceedance of the NEMP (HEPA, 2020) Freshwater 99% guidelines in surface water	MW078	**0.19**	0.02	0.01	<0.01	<0.01	<0.01

Legend	
Bold	Bold text indicates existing detection or exceedance of NEMP Human Health Screening Criteria
Blue Shading	Blue shading indicates sampling location with first time detection of PFOS+PFHxS and/or PFOA
Yellow Shading	Yellow shading indicates sampling location with first time exceedance of NEMP Human Health Screening criteria
Purple Shading	Purple shading indicates sampling location with first time exceedance of NEMP Ecological Screening criteria

5.2.3 Non-PFAS Groundwater Analytical Results

The non-PFAS groundwater analytical results from this sampling event are presented in **Table T2** in **Appendix B**.

5.3 Surface Water Observations and Results

5.3.1 Surface Water Observations and Field Measurements

Surface water observations and field measurements recorded during the sampling event are presented in **Table 10** below.

Table 10 Surface Water Observations and Field Measurements

Compound	Criteria
Fieldwork Dates	The surface water sampling was completed on 25, 26 and 29 November, and 14 December 2021.
Access and Sample Collection	All surface water sampling locations were accessible and able to be sampled with the exception of SW081.
Contamination Observations	No obvious visible signs of contamination were observed, with the exception of minor foam of unknown origin at SW001.

Compound	Criteria
Geochemical Parameters	Surface water geochemical parameters were measured prior to collecting surface water samples. The stabilised readings are presented in **Table T1** in **Appendix B**, and are summarised below: • dissolved oxygen ranged from 0.0 mg/L (SW037) to 9.46 mg/L (SW030) indicating relatively poorly oxygenated to well oxygenated conditions • electrical conductivity ranged from 6.64 µS/cm (SW020) to 1642 µS/cm (SW005) indicating fresh to slightly brackish conditions • pH ranged from 5.7 (SW014) to 7.68 (SW035) indicating slightly acidic to slightly alkaline conditions • corrected redox ranged from 33.4 mV (SW037) to 373.1 mV (SW001) indicating reducing conditions.

5.3.2 PFAS Surface Water Analytical Results

The PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B**.

In summary, PFAS compounds were reported at concentrations above the laboratory LOR in 21 of the 22 surface water samples analysed. Concentrations of PFOS+PFHxS and/or PFOA exceeded the adopted human health screening criteria in 6 of the 22 primary surface water samples analysed. Concentrations of PFOS and/or PFOA exceeded the adopted ecological screening criteria in 21 of the 22 primary surface water samples analysed.

No first time detects, or first time exceedances of the adopted human health or ecological screening criteria were noted in the dataset.

5.3.3 Non-PFAS Surface Water Analytical Results

The non-PFAS surface water analytical results from this sampling event are presented in **Table T3** in **Appendix B**.

5.4 Sediment Observations and Results

5.4.1 Sediment Observations

Sediment observations recorded during the sampling event are presented in **Table 11** below.

Table 11 Sediment Observations

Compound	Criteria
Fieldwork Dates	The sediment sampling was completed 25, 26 and 29 November and 14 December 2021.
Access and Sample Collection	All sediment sample locations were accessible and able to be sampled with the exception of SD081.
Sediment observations	Sediments sampled during this monitoring event were variable comprising sand, silt, gravel and clay materials with minor inclusions of organic material (roots, grass, wood, moss and leaves) noted. No anthropogenic inclusions were noted. No staining was observed. Minor organic odour was noted at a small number of locations. Refer to **Table T4** in **Appendix B** for a summary of sediment classifications and observations.

5.4.2 PFAS Sediment Analytical Results

The PFAS sediment analytical results from this sampling event are presented in **Table T5** in **Appendix B**. In summary, PFAS compounds were detected at concentrations above the laboratory LORs in 19 of the 21 primary sediment samples analysed.

No first time detects of PFAS were noted in the dataset.

5.5 Historical Sampling Data

Historical groundwater, surface water and sediment sampling data are presented in **Tables T6, T7** and **T8** (respectively) in **Appendix B**.

6.0 Summary and Next Sampling Events

6.1 Summary of Monitoring Event

The biannual monitoring event was completed at the Site, publicly accessible land and private property within the Management Areas between 22 and 29 November and 14 December 2021. The program included:

- groundwater gauging at 88 of 92 monitoring wells and bores. It is noted that four planned sampling locations could not be gauged
- groundwater sampling at 88 of 92 monitoring wells and bores. It is noted that four planned sampling locations could not be sampled
- surface water sampling at all 22 of 23 planned locations. It is noted that one planned sampling location could not be sampled
- sediment sampling at 21 of 22 planned locations. It is noted that one planned sediment sampling locations could not be sampled

Table 12 below summarises the findings of the November 2021 sampling event and the recommended actions.

Table 12 Summary of Sampling Event

Item	Comment	Recommended Actions
Access to sampling locations	The following were accessed and able to be sampled: • 88 out of 92 monitoring wells and bores • 22 out of 23 surface water locations • 21 out of 22 sediment locations	AECOM will attempt to access locations MW044, MW045, SW081 and SD081 during the next scheduled sampling event in May 2022.
Monitoring well network condition	Monitoring wells MW006 and MW099 were noted to have been destroyed. Monitoring wells MW117, MW118 and MW119 were observed to be missing well caps and surface water infiltration was observed. Given the (up to) five times increase in PFAS concentrations observed in these wells, it is considered likely that the integrity of these wells has been compromised. AECOM installed new monitoring well caps on each of these wells following the November 2021 monitoring event to prevent further surface water ingress. In MW098, the SWL was noted to be at the ground surface. Given that the SWL within this well has been historically gauged to be between 1.072 and 2.144 m btoc, it is possible that the integrity of this well has been compromised.	AECOM recommends that monitoring wells MW006 and MW099 be removed from the OMP and decommissioned, given that the existing monitoring well network provides sufficient coverage in these areas. AECOM recommends redeveloping monitoring wells MW098, MW117, MW118 and MW119 prior to the next scheduled OMP sampling event in May 2022.
Analytical Results	PFAS were detected at concentrations above the laboratory LOR in 75 of the 88 groundwater samples, 21 of 22 surface water samples and 19 of 21 sediment samples analysed.	No actions recommended.

Item	Comment	Recommended Actions
First time exceedance of NEMP drinking water guideline values in groundwater	Concentrations of PFOS+PFHxS exceeded the NEMP drinking water criteria for the first time in monitoring well MW078.	Monitoring well will be sampled again during the May 2022 sampling event.
First time exceedance of NEMP ecological screening criteria in groundwater	Concentrations of PFOS exceeded the NEMP ecological screening criteria for the first time in monitoring well MW078.	Monitoring well will be sampled again during the May 2022 sampling event.
First time detection of PFOS+PFHxS and/or PFOA in groundwater	PFOS was detected for the first time in groundwater at monitoring wells MW078.	Monitoring well will be sampled again during the May 2022 sampling event.

6.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for May 2022.

6.3 Upcoming Annual Interpretive Report

The next annual interpretive report is scheduled to be delivered in Q2 2022.

Equipment Check

Oil/Water Interface Meter - Solinst 122 Interface Meter

Customer:		**Manufacturer:**	Solinst Interface Meter
Contact:	Milenko	**Instrument:**	Model 122
Order:		**Serial #:**	312160
		Tape length:	60m

Item	Test	Pass	Comments
Battery	Voltage (2 x 9v battery)	✓	Voltage above 7.9v
	Fuses	✓	
	Capacity	✓	
Probe	Decontaminated	✓	
	Condition	✓	
	Operation	✓	
Connectors	Condition	✓	
Tape Check	Condition	✓	New
	Decontaminated	✓	
Instrument Test	At surface level	✓	Tap water and Citronella oil
Speaker	Operation	✓	

Comments

Unit in good condition.

This is to certify that the above instrument has been checked and is in good working order.

Checked By: Milenko Sisic

Check Date: 21/10/2021 **Due for Check:** 21/04/2022

Appendix D

Analytical Data Validation

Appendix D Analytical Data Validation

Project number:	60612562	**Validation by:**	[redacted]	**Date:** 15/12/2021
Client:	Department of Defence	**Reviewed by:**	[redacted]	**Date:** 14/01/2022
Site:	RAAF Base Richmond			
Matrix type:	Soil / Groundwater / Surface Water	**Project Manager:**	[redacted]	
Primary samples:	88 Groundwater samples / 22 Surface water samples / 21 Sediment samples			
Laboratory:	ALS (Primary) Envirolab (Secondary)			
Lab report references:	ES2142389, ES2143118, ES2143536, ES2145705, 284165, 285371			
Key Issues:	No issues were identified that have the potential to impact upon the reliability of the Data. AECOM considers that the field procedures and laboratory QA/QC processes employed were appropriate for the purposes of the investigation.			
Field QA / QC				
Field DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).			
Sampling personnel	Sampling was conducted by Andrew Spoor, Ayrton Donegan and Sebastien McCulloch between 22 to 29 November and 14 December 2021. Field personnel were all suitably qualified and experienced AECOM Environmental Scientists.			
Handling and Preservation	Primary and duplicate samples for groundwater, surface water and sediment were placed in a chilled cooler between sampling and analysis. Samples were received preserved and chilled at the laboratory, with all containers received within the recommended temperature range (4 ± 2°C) with the exception of batches: • ES2142389 which was received at 1.0°C • ES2143536 which was received at 0.2°C • ES2145705 which was received at 16.3°C While the received temperatures were outside the recommended range, they are not considered to impact upon the reliability of the results given that samples were transported to the laboratory within 48 hours of being collected. The inter-laboratory duplicate samples were received at the secondary laboratory (Envirolab) within the recommended temperature range (4 ± 2°C). All samples were received at the laboratory in appropriate sample containers.

Calibration of Equipment	Measurement of groundwater geochemical parameters was undertaken using the YSI WQM Professional Plus, which was calibrated by the supplier prior to use, in accordance with manufacturer's instructions and "bump tested" in the field at the beginning of each sampling day Measurement of depth to groundwater was undertaken by an interface probe, which was serviced by the supplier AES prior to use. All calibration and service certificates are presented in **Appendix C**.
Sampling Methodology	The majority of groundwater samples were collected using pre-deployed 1.1L HydraSleeves™, with collected water deposited directly into laboratory prepared bottles. Groundwater samples MW007, MW009, MW072, MW074, MW120 and MW121 were collected using dedicated disposable bailers as HydraSleeves™, were either not present, did not deploy appropriately or insufficient water was available. Following laboratory instructions, the sample bottles were filled to the top, caps immediately applied and samples stored on ice for preservation. Water quality parameters were collected down-well via a submerged water quality meter and were recorded once field values had stabilised. Surface water samples were either collected from directly beneath the surface to limit the infiltration of sediment into samples or using dedicated, disposable bailers where access was limited. Smaller vials were filled from larger sampling containers, to ensure preservative acids did not spill. Following laboratory instructions, the sample bottles were filled to the top, caps immediately applied and samples stored on ice for preservation. Sediment samples were collected using a trowel and deposited directly into laboratory prepared containers. Following laboratory instructions, the sample containers were filled to the top, caps immediately applied and samples stored on ice for preservation. After each sampling at each location, the water quality meter and interface probe were decontaminated using Liquinox and the consumables (nitrile gloves, HydraSleeves™ and/or bailers) were disposed of.

Project number:	60612562	**Validation by:**	[redacted]	**Date:** 15/12/2021

Laboratory:	ALS (Primary) Envirolab (Secondary)			
Lab report references:	ES2142389, ES2143118, ES2143536, ES2145705, 284165, 285371			

Chain of Custody (COC)	All samples taken were reported on the Chain of Custody documents (COC) and subsequent email amendments analysed for requested analytes.
Rinsate Blank	Rinsate blank samples were collected at a frequency of one per day of sampling (seven in total). Rinsates were either collected from the final rinse of the interface probe or a clean, unused nitrile glove. The results of the rinsate analysis indicated that concentrations of PFAS were below the limit of reporting (LOR) for all analytes tested. Rinsate results are presented in **Table D3** in **Appendix D**.
Frequency of field QC	Field duplicate and triplicates (inter-laboratory duplicates) were to be collected at a frequency of one in ten primary samples (10%). In total, fourteen field duplicates were collected for water samples (12.7%), and three field duplicate for sediment (14.3%) were collected, meeting the DQI. Fourteen inter-laboratory duplicates were collected for water samples (12.7%), and three triplicates for sediment (14.3%) were collected, meeting the DQI.
Laboratory QA / QC	
Laboratory DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2021).
Tests requested / reported	All primary water samples were analysed for the Per- and Polyfluoroalkyl Substances (PFAS) extended suite, with approximately 20% of all samples analysed for nutrients (ammonia, nitrate, nitrite, phosphorous) and metals (aluminium, bromine, iron, manganese). All primary sediment samples were analysed only for the PFAS extended suite. All sample request of analysis was reported on the Chain of Custody (COC). Confirmation of results were requested and adopted for the below samples; • 0902_MW078_211125 • 0902_MW051_211123 • 0902_MW117_211125 • 0902_MW118_211125

Project number:	60612562	**Validation by:**	[redacted]	**Date:** 15/12/2021
Client:	Department of Defence	**Reviewed by:**	[redacted]	**Date:** 14/01/2022
Site:	RAAF Base Richmond			
Matrix type:	Soil / Groundwater / Surface Water	**Project Manager:**	[redacted]	
Primary samples:	88 Groundwater samples / 22 Surface water samples / 21 Sediment samples			
Laboratory:	ALS (Primary) Envirolab (Secondary)			
Lab report references:	ES2142389, ES2143118, ES2143536, ES2145705, 284165, 285371			

Holding time compliance	All samples were extracted and analysed within recommended holding times, with the exception of nutrients in batch **284165**. The holding time exceedance is not considered to affect the validity of the results given that the majority of nutrients results were reported within the same order of magnitude as the primary sample results. Furthermore, as the primary objective of the OMP is to monitoring changes in the nature and extent of PFAS at the Site, the holding time breach for nutrients is not considered to impact upon the delivery of the OMP.
Laboratory Accreditation	The primary laboratory was ALS Environmental Pty Ltd (Sydney) a National Association of Testing Authorities (NATA) accredited laboratory (Accreditation No. 825). The secondary laboratory used for the project was Envirolab (Envirolab, Sydney), also a NATA accredited laboratory (accreditation number 2901). All analysis was completed using NATA accredited methods.
Frequency of laboratory QC	The primary laboratory (ALS), reported a sufficient frequency of quality control samples with the exception of duplicates for the following workorders: • **ES2145705** - Moisture content in the soil laboratory duplicate (actual rate: 7.69%, expected rate: 10%). • **ES2143118** - Moisture content in the soil laboratory duplicate (actual rate: 8.33%, expected rate: 10%), and - Major Cations - Dissolved in the water laboratory duplicate (actual rate: 7.41%, expected rate 10%), The accuracy of the data can be assessed as acceptable based on method blank, laboratory duplicates, LCS recoveries, which were reported at or above the required frequencies and within control limits.
Method Blank	All method blank concentrations were reported <LOR for the analytes tested from the primary laboratory, ALS. This is presented in the laboratory Quality Control Report.
Laboratory duplicate RPDs	The reported laboratory duplicate Relative Percentage Differences (RPD) were within laboratories control limits. The laboratory duplicate RPDs are presented in the laboratory Quality Control Report.

Project number:	60612562	**Validation by:** [redacted]	**Date:** 15/12/2021
Client:	Department of Defence	**Reviewed by:** [redacted]	**Date:** 14/01/2022
Site:	RAAF Base Richmond		
Matrix type:	Soil / Groundwater / Surface Water	**Project Manager:** [redacted]	
Primary samples:	88 Groundwater samples / 22 Surface water samples / 21 Sediment samples		
Laboratory:	ALS (Primary) Envirolab (Secondary)		
Lab report references:	ES2142389, ES2143118, ES2143536, ES2145705, 284165, 285371		

Laboratory control spike recovery	Laboratory Control Spike (LCS) recoveries were within AECOM limits (70-130%) and / or laboratory analyte specific acceptance criteria (ASAC). The laboratory control spike recovery percentages are presented in the laboratory QC Reports.
Matrix spike recovery	The reported laboratory Matrix Spike (MS) recoveries were within the laboratory control limits for PFAS analytes with the exception of a number of PFAS compounds in batches ES2142389, ES2143118, ES2143536, ES2145705 and nutrients analytes in batches ES2142389, ES2143118, ES2143536 where the MS recovery was not determined due to background levels being greater than or equal to 4x spike level. Given the low limits of reporting for these PFAS compounds, AECOM considers that this would not significantly impact upon the reliability of the data. Matrix Spike recovery was less than the lower data quality objective for the following in report ES2145705: • 10:2 Fluorotelomer sulfonic acid (10:2 FTS) – 26.4% (69.2-143%)
Surrogate spike recovery	The reported surrogate spike recoveries were within laboratory control limits (60% - 120%).
QA / QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.
Data transcription	A check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	LORs were sufficiently low to enable assessment against adopted guideline criteria.

Project number:	60612562	**Validation by:**	[redacted]	**Date:** 15/12/2021
Client:	Department of Defence	**Reviewed by:**	[redacted]	**Date:** 14/01/2022
Site:	RAAF Base Richmond			
Matrix type:	Soil / Groundwater / Surface Water	**Project Manager:**	[redacted]	
Primary samples:	88 Groundwater samples / 22 Surface water samples / 21 Sediment samples			
Laboratory:	ALS (Primary) Envirolab (Secondary)			
Lab report references:	ES2142389, ES2143118, ES2143536, ES2145705, 284165, 285371			

Field duplicate and Triplicate RPDs	Water Field duplicate RPDs were reported within the DQIs, with the exception of a number of PFAS analytes for water sample duplicate pairs exceeding the DQI with RPDs ranging between 31% and 113%. The Ionic Balance RPD for SW009/QC214 was 291% (refer to **Table D1**). Sediment Field duplicate RPDs were reported within the DQIs, with the exception of a number of PFAS analytes for sediment sample duplicate pairs exceeding the DQI with RPDs ranging between 37% and 133% (refer to **Table D2**). The RPD exceedances were largely attributed to the low concentrations of PFAS compounds reported in the primary and duplicate samples which were noted generally to be within the same order of magnitude for each duplicate pair. Given that the primary and duplicate samples were all within the same concentrations range for the applicable guideline criteria (where available), AECOM does not consider that these RPD exceedances impact upon the reliability of the data. Water and Sediment Duplicate RPD results are presented in Tables **D1** and **D2** (respectively) in **Appendix D**.
Rinsate Results	Seven rinsate blanks were collected during this sampling event, in accordance with the SAQP. All analytical results were recorded to be below the laboratory limit of reporting and are presented in **Table D3** in **Appendix D**.

Overall Assessment

Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

***RPDs have only been considered where a concentration is greater than 1 times the LOR.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each LOR multiplier range are: 30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**

***RPDs have only been considered where a concentration is greater than 1 times the LOR.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each LOR multiplier range are: 30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Extra sample received: M043.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples received	: 32		
No. of samples analysed	: 32		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EP231X: PFAS results for sample #10 confirmed by re-extraction and re-analysis.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **ES2142389**	Page	: 1 of 13
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Contact	: Christopher Redford
Address	: LEVEL 21 420 GEORGE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 23-Nov-2021
Order number	: 60612562_5.1	Date Analysis Commenced	: 24-Nov-2021
C-O-C number	: 30538	Issue Date	: 01-Dec-2021
Sampler	: ANDREW SPOOR, AYRTON DONEGAN		
Site	: Richmond		
Quote number	: SY/139/19 v4 60612562_5.1		
No. of samples received	: 32		
No. of samples analysed	: 32		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2142389**	Page	: 1 of 10
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 23-Nov-2021
Site	: Richmond	Issue Date	: 01-Dec-2021
Sampler	: ANDREW SPOOR, AYRTON DONEGAN	No. of samples received	: 32
Order number	: 60612562_5.1	No. of samples analysed	: 32

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
ED045G: Chloride by Discrete Analyser	ES2142389--004	0902_MW010_211123	**Chloride**	16887-00-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2142389--022	0902_MW070_211122	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Dates

Date Samples Received	: 26-Nov-2021 18:30	Issue Date	: 30-Nov-2021
Client Requested Due Date	: 03-Dec-2021	Scheduled Reporting Date	: **03-Dec-2021**

Delivery Details

Mode of Delivery	: Undefined	Security Seal	: Intact.
No. of coolers/boxes	: 3	Temperature	: 4.0'C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 66 / 66
		No. of samples NOT collected	1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Sample 0902_MW043_211123 was not received due to the following reason: Sample not received.
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Project	: NSW_0902_PFASOMP	Date Samples Received	: 26-Nov-2021 18:30
Order number	: 60612562_5.1	Date Analysis Commenced	: 27-Nov-2021
C-O-C number	: 30771	Issue Date	: 06-Dec-2021 17:10
Sampler	: ANDREW SPOOR, AYRTON DONEGAN		
Site	: Richmond		
Quote number	: SY/139/19 v4 60612562_5.1		
No. of samples received	: 67		
No. of samples analysed	: 66		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Ashesh Patel	Senior Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EG020: Bromine & Iodine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EP231X: LOR raised due to high moisture content.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

QUALITY CONTROL REPORT

Work Order	: **ES2143118**	Page	: 1 of 30
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Contact	: Christopher Redford
Address	: LEVEL 21 420 GEORGE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 26-Nov-2021
Order number	: 60612562_5.1	Date Analysis Commenced	: 27-Nov-2021
C-O-C number	: 30771	Issue Date	: 06-Dec-2021
Sampler	: ANDREW SPOOR, AYRTON DONEGAN		
Site	: Richmond		
Quote number	: SY/139/19 v4 60612562_5.1		
No. of samples received	: 67		
No. of samples analysed	: 66		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Ashesh Patel	Senior Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2143118**	Page	: 1 of 20
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 26-Nov-2021
Site	: Richmond	Issue Date	: 06-Dec-2021
Sampler	: ANDREW SPOOR, AYRTON DONEGAN	No. of samples received	: 67
Order number	: 60612562_5.1	No. of samples analysed	: 66

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	1	12	**8.33**	**10.00**	×	NEPM 2013 B3 & ALS QC Standard
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	4	38	**10.53**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	2	38	**5.26**	**5.00**	✓	NEPM 2013 B3 & ALS QC Standard
Method Blanks (MB)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Delivery Details

Mode of Delivery	: Pickup	Security Seal	: Intact.
No. of coolers/boxes	: 3	Temperature	: 0.2'C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 51 / 51
		No. of samples NOT collected	2

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please note that only PFAS and metals analysis was added on sample 52 due to insufficient volume.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Sample 0902_SW022_211129 was not received due to the following reason: Sample not received.
- Sample 0902_MW030_211129 was not received due to the following reason: Sample not received.
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Site	: NSW_0902		
Quote number	: SY/139/19 v4 60612562_5.1		
No. of samples received	: 53		
No. of samples analysed	: 51		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **ES2143536**	Page	: 1 of 27
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: MAT JENKINS	Contact	: Christopher Redford
Address	: LEVEL 21 420 GEORGE STREET SYDNEY NSW, AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61 2 8784 8555
Project	: NSW_0902_PFASOMP	Date Samples Received	: 30-Nov-2021
Order number	: 60612562_5.1	Date Analysis Commenced	: 01-Dec-2021
C-O-C number	: 30345	Issue Date	: 07-Dec-2021
Sampler	: ANDREW SPOOR, AYRTON DONEGAN		
Site	: NSW_0902		
Quote number	: SY/139/19 v4 60612562_5.1		
No. of samples received	: 53		
No. of samples analysed	: 51		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**
