### **Army Aviation Centre Oakey**

**Ongoing Monitoring Interpretive Report (October 2021 to November 2022)** 

Defence undertakes monitoring on and around Army Aviation Centre Oakey to understand per- and polyfluoroalkyl substances (PFAS) movement and concentrations in soil and water. The monitoring results inform PFAS management and remediation activities. Monitoring requirements are set out in an Ongoing Monitoring Plan. Defence started ongoing monitoring on and around Army Aviation Centre Oakey in 2019.

#### What is an Ongoing Monitoring Report?

An Ongoing Monitoring Report collates and interprets PFAS sampling results from the Ongoing Monitoring Plan.

## Ongoing Monitoring Report (October 2021 to November 2022)

This report covers groundwater, surface water and sediment sampling conducted between October 2021 to November 2022, from locations on and around Army Aviation Centre Oakey. The ongoing monitoring report also compares the results of the new sampling to previous results.

#### What does the Report tell us?

Based on the samples collected on and around Army Aviation Centre Oakey, the levels of PFAS contamination were generally consistent with previous results and identified:

- Highest groundwater PFAS concentrations at known, on-base source areas such as former fire training areas.
- Slight increases occurred at several groundwater sampling locations although increases are within expected variability. These locations will continue to be monitored over time to identify any trends.

 PFAS concentrations in surface water decreased in 2022. This was attributed to increased rainfall and higher surface water flows during the wet season.

The findings from the Ongoing Monitoring Interpretive Report do not suggest a change in any potential exposure risks to the community.

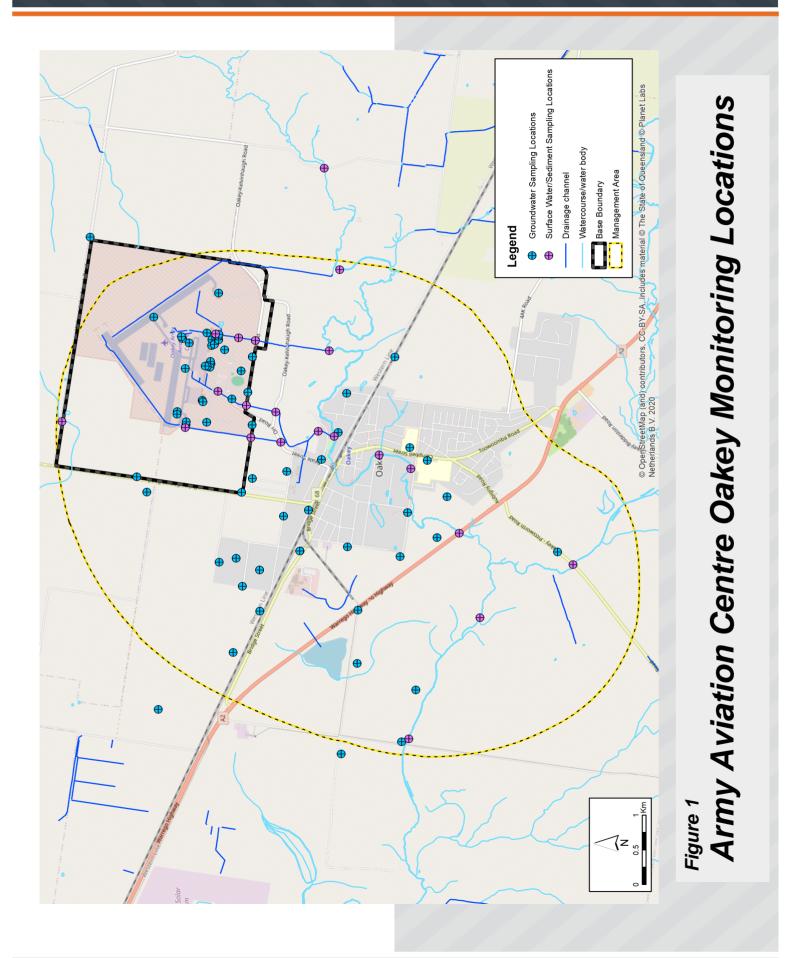

### Number of samples collected and analysed (October 2021 to November 2022)

GROUNDWATER	Groundwater is water beneath the earth's surface. It often supplies bores, wells or springs.	collected from
SURFACE WATER	Surface water is water that collects on the ground and can be in the form of creeks, rivers, lakes, wetlands, oceans and more.	collected from 22 surface
SEDIMENT	Sediment is made of broken down remains of rocks, minerals, plants, and animals that is moved and deposited to a new location.	collected from 22 sediment

#### Next steps

Defence will continue monitoring on and around Army Aviation Centre Oakey to further understand any changes in PFAS concentrations that may appear over time. This ongoing monitoring report and all other reports and factsheets prepared for Army Aviation Centre Oakey are available on the Defence website (see page 3). **PFAS INVESTIGATION AND MANAGEMENT PROGRAM**
