Executive Summary

Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the Ongoing Monitoring Plan (OMP) (Defence 2020) for monitoring of per- and poly-fluoroalkyl substances (PFAS) at Royal Australian Air Force (RAAF) Base Amberley (the Base), located in Queensland, as outlined in the PFAS Management Area Plan (PMAP) (Defence, 2020)[1].

The OMP outlines the rationale and scope for the monitoring of concentrations and extent of PFAS in groundwater, surface water and sediment originating from the Base. The OMP was implemented within the RAAF Base Amberley Management Area. The Management Area (as shown in **Figure 1**, **Appendix A**) includes the Base as well as encompassing off-Base areas adjacent to Bremer River and Warrill Creek.

Objective

The objective of the ongoing monitoring program, as outlined in the OMP, is to assess changes in the nature and extent of PFAS within the environment. The OMP uses the monitoring network developed as part of the PMAP to monitor the amount of PFAS leaving the Base through groundwater or surface water. The PMAP was designed to target areas where there is a potentially elevated risk to a receptor (for example, to people or an ecological environment) associated with Defence's historical use of legacy PFAS containing aqueous film forming foam (AFFF).

Monitoring Scope

AECOM completed biannual monitoring of groundwater, surface water and sediment between March 2021 and May 2023 in general accordance with the most recent version of the sampling, analysis and quality plan (SAQP) (AECOM, 2023b) applicable at the time the sampling was completed, with deviations from the SAQP outlined in **Section 3.2**. The monitoring program consists of biannual monitoring events at the end of the wet season (March/April 2021, March/April 2022 and April/May 2023) and at the end of the dry season (October/November 2021 and October 2022). Sampling under these different climatic conditions provides a better understanding of the movement and concentrations of PFAS in the environment.

Groundwater samples could not be collected during the monitoring period from six of the monitoring wells, as the wells were destroyed (MW015, MW039, MW040 and MW056) or damaged (MW008 and MW009). Up to two monitoring wells during each sampling event could not be accessed due to dense vegetation.

The loss of these groundwater monitoring wells reduces information available on changes in the nature and extent of PFAS in groundwater adjacent to and down-gradient of three confirmed potential source areas (CPSA), CPSA A (former topside aviation fire training area), CPSA M (fuel farm 1 and triple interceptor pit) and CPSA Y (former secondary fire training area).

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

[1] The PMAP is publicly available at Publications : Amberley : Department of Defence. The OMP can be found within the PMAP report as Attachment 1.

Interpretive Assessment

Data collected during the March 2021 to May 2023 monitoring period was compared to historical data for the included sampling locations (refer to historical data tables in **Appendix B)**. Concentrations were generally consistent and within the historical data ranges (AECOM, 2021b)[2] for most wells. This means that concentrations are generally stable across the Management Area and varied by less than an order of magnitude, up or down, from previous monitoring events.

The current monitoring network is considered adequate to monitor PFAS in groundwater, surface water runoff and sediment, and to provide early detection of significant changes in migration at most of the potential source areas. Due to the loss of six wells, replacement wells are required to provide information down-gradient of three source areas, CPSA A, M and Y to provide greater certainty in interpreting the nature of PFAS.

Groundwater Results

Groundwater Flow Direction

A groundwater aquifer is an underground layer of porous and permeable rock, gravel, sand or silt, which can contain or transmit groundwater. There are two groundwater aquifers that are monitored at Amberley: Alluvium-Tertiary Formation and Wallon Coal Measures. The Walloon Coal Measures aquifer is present at surface along the western boundary of the Base and underlies the Alluvium-Tertiary Formation aquifer at other locations.

The groundwater flow direction in the shallow aquifer during the five sampling events was similar. Groundwater flows in multiple directions from the central western portion of the Base, towards Bremer River and Warrill Creek flowing northeast, east and southeast. Groundwater flowing outwards in multiple directions from a single area where there is elevated groundwater is referred to as radial.

The groundwater contours in the deeper aquifer during the five sampling events were also similar, with groundwater flowing from west to east. This is generally consistent with previous investigations and monitoring rounds.

PFAS Concentrations

The groundwater monitoring results do not suggest a change in the understanding of contamination or risk within the Management Area. The following was observed:

- PFAS concentrations in groundwater and the inferred extent of PFAS in groundwater were similar to previous results. The highest concentration of sum of PFOS and PFHxS[3] in groundwater was recorded at MW046 located adjacent to, and down-gradient of the AFFF Wastewater Holding Tank, which is an on-Base source area. Results for this well during the monitoring period were within the historical ranges.
- The results indicate stable concentrations at, or down-gradient of most source areas. New maximum PFAS concentrations were observed in some Base boundary monitoring wells including:
    - MW030 located along the central western Base boundary close to confirmed primary source area (CPSA) W (Fire Fighting Training School). The sum of PFOS and PFHxS concentration increased during the monitoring period from 3.4 µg/L in 2021 to 12.9 µg/L in April/May 2023. The potential for migration of PFAS in groundwater towards the west is uncertain as there are no monitoring wells to the west of MW030.
    - MW057S is adjacent to the southeastern Base boundary next to Warrill Creek. The sum of PFOS and PFHxS concentration was 2.6 µg/L in October/November 2022 (a first-time exceedance of recreational water guideline value[4]) compared to the previous maximum concentration of 0.1 µg/L in 2021. The increase was temporary, as a lower concentration was reported (1.3 µg/L) in the sample collected in April 2023. As there are no wells further down-gradient (to the east), the extent of PFAS in groundwater in this area is uncertain. The increase

[2] The historical data range is presented within the 2020 Annual Interpretive Report (AECOM, 2021b) publicly available at Publications : Amberley : Department of Defence
[3] PFOS is perfluorooctane sulfonate. PFHxS is perfluorohexane sulfonate.
[4] The recreational water use guideline value for sum of PFOS and PFHxS is 2.0 µg/L. The guideline value is identified in the PFAS National Environmental Management Plan (NEMP) (HEPA, 2020).

is potentially a seasonal effect due to the high rainfall that occurred in 2022 and potential interaction between surface water in Warrill Creek and groundwater in the shallow aquifer.

  - MW054S is adjacent to the southern Base boundary next to Warrill Creek. The sum of PFOS and PFHxS concentration was 0.4 µg/L in both October/November 2022 and April/May 2023 compared to the previous maximum concentration of 0.14 µg/L in 2021. The increase is potentially a seasonal effect due to the high rainfall that occurred in 2022 and potential interaction between surface water in Warrill Creek and groundwater in the shallow aquifer.

- Variable PFAS concentrations have been detected in monitoring well MW020, located in the central portion of the Base, down-gradient of CPSA Z (fuel underground storage tank with AFFF listing). Concentrations increased in post-wet season monitoring events in 2021, 2022 and 2023 with PFAS concentrations doubling each year. The reason for the increase has not been verified. The localised extent of PFAS is uncertain as there are no nearby down-gradient wells due to the presence of the operational runways with the nearest down-gradient wells approximately 1.5 km to the east-south-east.

The new maximum concentrations may relate to the wetter conditions in 2022, where approximately twice the annual rainfall occurred, compared to the long-term average. The extent of PFAS in groundwater down-gradient of these monitoring wells is uncertain as there are no wells further down-gradient. If increasing concentrations trends are confirmed in future sampling events (October 2023 and April 2024), additional monitoring wells may be required to delineate the extent of PFAS down-gradient of these locations. Ongoing monitoring at these locations will establish the longer-term PFAS trends.

Surface Water and Sediment

PFAS concentrations in surface water and sediment sampling locations were generally similar to previous historical results (AECOM, 2021b).

With minor exception, there were no first-time detections or new exceedances of guideline values detected in surface water during the 2021 to 2023 monitoring period at the RAAF Amberley Management Area[5].

The sum of PFOS and PFHxS concentration at SW033 (an on-Base drain) increased by an order of magnitude higher than the historical range within the 2021 monitoring period. The concentration decreased during 2022 and 2023 sampling events. Surface water location SW033 is located on-Base within a known PFAS source area and no clear seasonal variations were apparent. PFAS concentrations within known on-Base source areas typically show fluctuations. Ongoing monitoring at this location will establish any long-term trend.

Concentrations of PFAS in surface water vary between locations and over time; however, a review of PFAS concentrations graphed over time does not indicate any trends for PFAS concentrations (i.e., no clear linkage between the season of monitoring and increasing or decreasing PFAS concentrations). PFAS concentrations will continue to be monitored and graphed over time to assess any potential trends or variations in surface water.

There was one first-time detection of PFOA[6] in the sample from SW026 in October/November 2022, however, other PFAS (e.g., PFOS) have been consistently detected at this location. There was one new exceedance of the recreational water guideline value for sum of PFOS and PFHxS in the sample from SW094, located along the Bremer River in April 2022 (2.3 µg/L). However, PFAS were not detected at this location in the sample collected in October 2022. No locations further downstream exceeded the recreational water guideline value during the monitoring period. The Queensland Government has issued health advice on their website[7] advising people not to consume fish caught in Bremer River and

[5] There was a first-time detection of PFOA in SW026 (0.02 µg/L in October/November 2022, however PFOS and PFHxS have been consistently detected at this sampling location. There was a first-time exceedance of the sum of PFOS and PFHxS recreational water guideline value (HEPA, 2020) at SW094 in March/April 2022, however, the concentration in subsequent sampling events did not exceed the guideline value. Sampling location, SW304, an on-Base drain was sampled for the first-time in April 2023 and the concentration of sum of PFHxS and PFOS exceeded the recreational water guideline value. Concentrations of PFOS and PFOA also exceeded the ecological guideline values.

[6] PFOA is perfluorooctanoic acid

[7] Ipswich | Environment, land and water | Queensland Government (www.qld.gov.au)

Warrill Creek adjacent to RAAF Base Amberley and the location of SW094 is unlikely to be used for recreational purposes.

Sediment samples were co-located with surface water samples. During the monitoring period, there were nine first-time detections in sediment, with PFOA detected in six samples (SD004, SD009 and SD020, located along Warrill Creek, SD045 along Bremer River and SD038 and SD304 along on-Base drains) and sum of PFOS and PFHxS detected in five samples at SD089 and SD091 (located along Bremer River) and SD025 (upstream Bremer River) and SD038 and SD304 (on-Base drains) resulting in new maximums for the historical range within the monitoring period.

The concentration ranges for PFAS in sediment from creek locations were generally consistent with historical data. New maximum sum of PFOS and PFHxS concentrations in sediment were recorded in two-thirds of the drain sampling locations during the monitoring period and may reflect increased transport of sediment along drains due to the wetter conditions during 2022. Guideline values have not been established for PFAS in sediment. Although new maximum concentrations have been recorded during the monitoring period, the distribution of PFAS in sediment within the Management Area is similar to historical results and the risk profile is unchanged.

Risk Summary

The conceptual site model was reviewed considering the new monitoring data collected over the monitoring period from 2021 to 2023, and no changes were identified to sources, pathways or receptors at the Base or within the Management Area to change the risk profile, as described in the CH2M Hill (2018) and 2020 Annual Interpretive Report (AIR) (AECOM, 2021b). Due to the loss of on-Base wells and concentration increases in groundwater at some boundary locations there are some uncertainties regarding the lateral extent of PFAS beyond the Base boundary.

The data collected during the ongoing monitoring program suggest that the risk profile to human health and ecological receptors within the Base and the larger Management Area is unchanged, based on the following conclusions of the data assessment:

- The extent of PFAS in groundwater is generally similar to that presented in the detailed site investigation (DSI) (CH2M Hill, 2018) and monitoring event reports (CH2M Hill, 2020a, b, AECOM 2021b). The dataset indicates broadly steady PFAS concentrations at, or down-gradient of most source areas.
- PFAS analytical results for most individual monitoring wells were within historical ranges. Some wells at boundary monitoring locations have shown variability in PFAS concentrations. New maximum PFAS concentrations were identified at three boundary locations, along the central western boundary (MW030), and two locations along the southern and southeastern Base boundary (MW054S and MW057S). The extent of PFAS in groundwater is uncertain beyond these locations as there are no further down-gradient wells. Ongoing monitoring will verify the nature of these changes and inform if further monitoring points are required down-gradient of these locations.
- Although minor fluctuations in PFAS concentrations in surface water samples were reported, the results were typically within the range of historical results.
- PFAS concentrations in most sediment samples from creeks showed similar concentrations to previous years. PFAS concentrations in sediment in some on-Base drains have shown fluctuations in 2022 attributed to wetter weather and increased surface water flows, however, the overall distribution is considered unchanged.

Conclusions

Following a review of the data collected during the monitoring period, some uncertainties have been identified regarding the lateral extent of PFAS in groundwater down-gradient of source areas and boundary locations. Although no changes have been identified to the understanding of risks associated with the nature and extent of PFAS in the RAAF Base Amberley Management Area, additional data would need to be collected to address the uncertainties and meet the objectives of the SAQP and OMP.

Overall, the concentrations of PFAS across the different sample types and locations are consistent and of the same order of magnitude as historical data. Given the remaining PFAS concentrations at the on-

Base source areas, it is recommended that the ongoing monitoring program of groundwater, surface water and sediment is continued to monitor the extent of PFAS, potential migration and any associated risk changes.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) (Defence, 2020) at the Royal Australian Airforce (RAAF) Base Amberley (the 'Base') and Management Area. The locations of the Base and Management Area are shown in **Figure 1**, **Appendix A**.

To meet the objectives of the OMP, the monitoring was undertaken in accordance with the most recent version of the *Sampling Analysis and Quality Plan* (SAQP) (AECOM, 2021a, 2022b, c, 2023b) in place at the time of sampling. The most recent version of the SAQP for April /May 2023 is provided in **Appendix E**.

This Ongoing Monitoring Report (OMR) has been prepared in general accordance with the Defence (2022) *PFAS OMP Annual Interpretive Report Guidance* (Version 0.4) issued in October 2022 (Defence, 2022). The report summarises the results of the monitoring completed in the monitoring period from March 2021 to May 2023 (hereafter referred to as "the monitoring period").

1.1 Purpose and Objective

The objective of the OMP is to set out a program of monitoring to continue to assess the changes in the nature and extent of PFAS within the environment, where Defence's historical use of legacy aqueous film forming foam (AFFF) has led to an identified potentially elevated risk to a receptor, or potential future risk to a receptor within the Management Area.

The OMP (Defence, 2020) aims to achieve the following:

- An evidence base for targeted and effective risk management of PFAS contamination to protect human health and environmental receptors
- An early indication that additional management of PFAS contamination may be warranted in areas not currently affected by PFAS.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2020).

1.2 Scope of Work

The scope of work for this OMR is to assess changes to the nature and extent of selected PFAS over the monitoring period and evaluate if these changes have implications for the understanding of the conceptual site model (CSM) and the risk profile with respect to PFAS impacts at the RAAF Base Amberley Management Area. The locations of confirmed primary source areas (CPSAs) are shown in **Figure 2**, **Appendix A**.

The scope of work included the evaluation of data reported in the following factual reports, which are included in **Appendix F**:

- *Sampling Event Factual Report, March/April 2021 – PFAS OMP – RAAF Base Amberley*, February 2022 (AECOM, 2021c).
- *Sampling Event Factual Report, October 2021 – PFAS OMP – RAAF Base Amberley*, February 2022 (AECOM, 2022a).
- *Sampling Event Factual Report, March/April 2022 – PFAS OMP – RAAF Base Amberley*, September 2022 (AECOM, 2022d).
- *Sampling Event Factual Report, October/November 2022 – PFAS OMP – RAAF Base Amberley*, January 2023 (AECOM, 2023a).
- *Sampling Event Factual Report, April/May 2023 – PFAS OMP – RAAF Base Amberley*, June 2023 (AECOM, 2023c – in draft and therefore not included in **Appendix F**).

AECOM also compared data presented in this OMR to the data presented in the 2020 Annual Interpretive Report (AIR) (AECOM, 2021b).

2.0 Site Setting

2.1 Base Description and Setting

Table 1 provides a summary of the Base identification and setting, as presented in the PMAP (Defence, 2020).

Table 1 Base identification and setting summary (Defence, 2020)

Element	Description
Base ID	0861
Base Location	The Base is located at Southern Amberley Road, Amberley, Queensland approximately 7 kilometres (km) west of Ipswich and 50 km southwest of Brisbane. The Base consists of 716 property lots. The facility occupies approximately 2,030 hectares (ha) and includes the Base itself (**Figure 1** in **Appendix A**) and several parcels of Defence-owned land to the east and south of the Base. Approximately 1,600 ha are used for operational purposes with the remaining 430 ha leased for agricultural or commercial use.
Regional Climate	The climate in the Amberley area is warm and temperate with annual average day-time temperatures ranging from 21°C in July to 31°C in January. There is a wet season from December through to March, with the months from April to November being relatively dry.
Topography	The Base is mostly located in the floodplains of the Bremer River, and Purga and Warrill Creeks. The runways, taxiways and hangars are located below the 30 m Australian Height Datum (metres AHD) contour line, within the flood plains, where the topography is very flat (with surface gradients of 0.003 to 0.005), in the eastern portion of the Base. In the central west of the Base, the topography rises above the floodplain to topographical highs of 50 m AHD in the south (south of Frog's Hollow Gully) and 60 m AHD in the west, at the Fire Fighting Training School. Most of the other operational areas and accommodation are located in the central western area, above the floodplains.
Geology	The following geological units are present at the Base: • Quaternary Floodplain Alluvium, comprising silt, gravel, and clay in the eastern and lower elevation portions of the Base. • Tertiary Formation consisting of claystone, siltstone, sandstone, and basalt in the west-central at higher elevation portions of the Base and basalt, in the northwestern-central and southwestern-central portions of the Base. • Jurassic Walloon Coal Measures comprising shale, siltstone, sandstone, and coal seams, cropping out along the western Base boundary. • Quaternary (Holocene) Terrace Alluvium, lowest river terrace comprising gravel, sand, silt and clay along Bremer River and Warrill Creek at the northern, southern, and eastern boundaries, respectively.
Hydrogeology	Water-bearing units underlying the Base include the Quaternary Floodplain Alluvium, Tertiary Formation, and the Walloon Coal Measures. The Alluvium and Tertiary Formation are connected and are considered a single hydrogeological unit. The detailed site investigation (DSI) (CH2M Hill, 2018) identified that there was hydraulic connection between the Alluvium-Tertiary Formation and underlying Walloon Coal Measures. The geological data indicated vertical and horizontal flow in the Walloon Coal Measures may be restricted by lower hydraulic conductivity zones between coal seams, which may mean flow in the Walloon Coal Measures is not

Element	Description
	continuous across the Base. Groundwater at the Base has generally been encountered at depths between 10 to 15 metres below ground level (mbgl). Groundwater flow in both the Quaternary-Tertiary Formation and the Walloon Coal Measures is predominantly from the higher elevation central-west areas of the Base north and east towards Bremer River and southeast towards Warrill Creek. Based on groundwater and surface water elevations within and adjacent to the Bremer River and Warrill Creek, the DSI (CH2M Hill, 2018) identified that these watercourses were potentially both gaining and losing streams depending on the watercourse reach and season. An ephemeral water body, Frog's Hollow Gully, is present in the southwest portion of the Base and connects with Warrill Creek at the Base boundary. Based on the climatic conditions and groundwater recharge there is a rise of the groundwater table during the wet season. This increase in water table elevation has the potential to increase contaminant migration towards the surface water bodies during the wetter months.
Surface Water	The Base and Management Area are within the Bremer River sub-catchment. The Bremer River sub-catchment covers approximately 2,036 square kilometres (km^2) and is a major sub-catchment of the Brisbane River catchment. The main watercourses in the Bremer River sub-catchment include the Bremer River, Purga Creek and Warrill Creek. Purga and Warrill Creeks run in a south-to-north direction and follow the southern boundary of the Base before joining the Bremer River to the east of the Base. The Bremer River flows from west-to-east and borders the northwest, northern and eastern extents of the Base. Warrill Creek originates 50 km southwest of the Base, with a catchment area of 920 km^2. Flow into Warrill Creek is partly controlled by the Moogerah Dam on Reynolds Creek, a tributary of Warrill Creek. The Bremer River enters the Brisbane River 8 km downstream and to the northeast of the Base.
Base Management Drainage	There is an extensive stormwater drainage system across the Base originally constructed in the 1940s with various upgrades over time. The drainage system comprises open, lined, and unlined drains, covered lined drains, underground drainpipes and grated lined drains to direct water from operational areas to discharge points off-Base. Discharge points for the drainage system to Bremer River and Warrill Creek and catchments are shown on **Figures 3** & **5**, **Appendix A**.
Current and Previous Land Use (including AFFF use)	European settlement occurred around 1826, coinciding with the discovery of limestone in the area. Historical land use post-settlement included, an aboriginal mission and some areas of cotton farming and livestock rearing. The property was purchased by the Commonwealth between 1865 and 1938 and was developed as an airfield in 1940. The current Base is an operational air force facility and operates two runways. The main runway runs approximately north to south, parallel to the eastern boundary. The second runway is shorter and runs southwest to northeast and is in the southern part of the Base. Parallel to the main runway is a taxiway that services both runways and provides access to the main hangars. Most of the operational areas, historical and current, are located to the west of the runways and taxiways. Operational areas where AFFF has or is being used (see **Figure 2** in **Appendix A**) include: • The main hangars for 1 Squadron, 6 Squadron and 38 Squadron which house fire suppression systems • The redeveloped fire training area pad and AFFF holding tank • The fire-fighter training school • Fuel facilities • Engine test facilities

Element	Description
	• Temporary stockpile facility for PFAS impacted soils.
Land uses surrounding the Base	Land to the north, south and west of the Base is surrounded largely by rural residential areas and several urban suburbs. Warrill Creek and Bremer River form part of the boundary of the Base to the south and north, respectively with Purga Creek to the southeast of the Base. The surrounding land is used for grazing, cropping, mining and small acreages/hobby farms. East of the Base, land use changes from rural to industrial and residential approaching the City of Ipswich. Residential development and parkland areas are present adjacent to the Bremer River, downstream of the Base. Kayaking, canoeing, fishing and swimming are popular recreational activities in the waterways east of the Base.

2.2 Management Area

The Management Area includes the Base as well as off-Base areas where potential risks have been identified that require management, refer to **Figure 1**, **Appendix A**.

In addition to the Base, the Management Area encompasses the following specific areas where potential human health or ecological risks were identified in the PMAP (Defence, 2020):

- Warrill Creek – this area comprises Warrill Creek riparian zone adjacent to the southern boundary of the Base and extends as far downstream as the point of confluence with the Bremer River. This area includes private properties adjacent to the Base along this stretch of the creek. Private properties that lie within this area are used for agriculture and rural residential purposes. Note: this represents the area previously referred to as Area 1 in the DSI (CH2M Hill, 2018), human health risk assessment (HHRA) (EnRiskS, 2019) and ecological risk assessment (ERA) (EnRiskS, 2020) documents.
- Bremer River – this area comprises the Bremer River riparian zone adjacent to the northern and eastern boundaries of the Base and extends as far downstream as Woodend Road Reserve. Private properties within this area are used for agriculture and rural residential purposes.

The Management Area does not include the Bremer River and adjacent properties to the north and northwest of the Base (upstream of the section of Bremer River referred to above), or Purga Creek, south of the Base.

2.3 PFAS Source Areas

The DSI (CH2M Hill, 2018) identified 29 CPSAs for PFAS on-Base which are shown in **Figure 2** in **Appendix A** and listed in the table below:

Table 2 Summary of CPSAs

CPSA Type	CPSA	Description
Major	A	Former Topside Aviation Fire Training Area (FTA) and current FTA Pad
	B	Hangar 410 (Building 410) and Former Landfill
	C	Frogs Hollow Former Fire Training School Location
	D	Sewage Treatment Plant (STP)
	G	Former FTA and Operations Testing Area
	J	Former FTA and Operations Testing Area
	M	Former Fuel Farm 1 and Triple Interceptor Pit
	N	Fire Station, FTA training
	U	38 Squadron Hangar

CPSA Type	CPSA	Description
	V	AFFF Wastewater Holding Tank[8]
	W	Fire Fighting Training School
	X	Former Structural and Open Pit FTA
	Y	Former Secondary FTA
	DD	HS748 Former FTA on Disused Runway
Moderate	E	Historic Containment Pond
	CC	Former Landfill
	FF	Buried PFAS impacted stockpile from CPSA A
	S	AFFF Store / Truck Washdown at Fuel Farm 2/2A
Minor	BB	Areas used for irrigation – former grassed runways
	F	Potential former FTA and Landfill
	Q	1 Squadron Hangar and 6 Squadron Hangar
	Z	Fuel UST with AFFF listing
Insignificant	H	Potential Former FTA and Landfill
	I	Potential Former FTA and Landfill
	L	Potential Former Fire Training and Operations Testing Area
	O	Potential location of F1-11 2006 incident
	P	Potential location of 1978 Skyhawk incident
	R	K Store- potential AFFF storage
	T	Potential Location of Aircraft F-4E Incident

The DSI identified two secondary impact areas:

- AA – triple interceptor pits at engine test cell facilities 1 and 2, which receive wastewaters from a variety of on-Base facilities.
- EE – former sports ovals – potentially irrigated with PFAS contaminated wastewater.

Following completion of the HHRA (EnRiskS, 2019), 15 of these source areas were considered relevant from the perspective of contributing materially towards risk, identified below:

Source areas with a high relative contribution toward risk:

- CPSA A – Former Topside Aviation FTA and current FTA Pad
- CPSA D – Sewage Treatment Plant

Source areas with a moderate relative contribution toward risk:

- CPSA N – Former Fire Station
- CPSA V – AFFF Wastewater Holding Tank
- CPSA W – Fire Fighting Training School
- CPSA X – Former Structural and Open Pit FTA

Source areas with a low relative contribution toward risk:

- CPSA B - Hangar 410 (Building 410) and Former Landfill
- CPSA C – Frogs Hollow Former Fire Training School

[8] Revised from Moderate to Major following a recommendation in CH2M Hill (2020a).

- CPSA G – Former FTA and Operations Testing Area
- CPSA J – Former FTA, Operations Testing Area and Bomb Replacement Apron
- CPSA M – Former Fuel Farm 1
- CPSA U – 33 Squadron Hangar
- CPSA Y – Former Secondary FTA
- CPSA CC – Former Landfill
- CPSA DD – HS748 Former FTA on Disused Runway.

3.0 Sampling and Analytical Methodology

3.1 Sampling Methodology

The sampling methodology is presented in the SAQP, presented in **Appendix E**.

The SAQPs (AECOM, 2021a, 2022b, c, 2023b) outline the proposed schedule and rationale for sampling, prescribing six-monthly groundwater, surface water and sediment sampling within the Management Area.

The sampling events conducted between March 2021 and May 2023 included the collection of selected groundwater, surface water and sediment samples from across the Management Area. On-Base and off-Base groundwater sampling locations are shown in **Figure 4** in **Appendix A** and surface water and sediment sampling locations are shown in **Figure 5**, **Appendix A**.

Table 3 provides a summary of the groundwater sampling locations including the approximate source areas up-gradient of the well and aquifer monitored to give context to the information presented in **Section 7.0**.

Table 3 Groundwater sampling locations

Monitoring Well	Approximate source area up-gradient of monitoring well	Aquifer Monitored
MW002	Major CPSA A Former Topside Aviation FTA and current FTA Fire Pad	Walloon Coal Measures
MW033		Walloon Coal Measures
MW047	Major CPSA B Hangar 410 and Former Landfill	Tertiary Formation
MW037	Major CPSA C Frogs Hollow Former Fire Training School Location	Alluvium
MW021	Major CPSA D Sewage Treatment Plant	Alluvium
MW032		Alluvium
MW048	Moderate CPSA E Historical Containment Pond	Alluvium
MW050	Major CPSA G Former FTA and Operational Testing Area	Alluvium
MW005	Major CPSA J Former FTA and Operational Testing Area	Alluvium
MW006	Major CPSA M Former Fuel Farm 1 and Triple Interceptor Pit and Major CPSA N Fire Station	Alluvium
MW023		Alluvium
MW028		Alluvium
MW029		Alluvium
MW036		Alluvium
MW309		Tertiary Formation
MW046	Minor CPSA V AFFF Wastewater Holding Tank	Tertiary Formation
MW026	Major CPSA W Fire Fighting Training School	Tertiary Formation
MW030		Walloon Coal Measures
MW031		Tertiary Formation
MW042		Walloon Coal Measures
MW043		Walloon Coal Measures
MW041	Major CPSA X Former Structural and Open Pit FTA	Walloon Coal Measures

Monitoring Well	Approximate source area up-gradient of monitoring well	Aquifer Monitored
MW020	Minor CPSA Z Fuel underground storage tank (UST) with AFFF listing	Tertiary Formation
MW007	Moderate CPSA AA Triple Interceptor Pits at Engine Test Cell Facilities 1 and 2	Alluvium
MW012	Minor CPSA BB Areas used for irrigation- former grassed runways	Tertiary Formation
MW022	Moderate CPSA CC Former Landfill	Alluvium
MW049	Major CPSA DD HS748 Former FTA on Disused Runway	Alluvium
MW054S	Wells are adjacent to off-Base Warrill Creek. These locations are down-gradient of multiple source areas.	Alluvium
MW054D		Walloon Coal Measures
MW057S		Alluvium
MW057I		Tertiary Formation
MW024	Wells are adjacent to on-Base Bremer River. These locations are down-gradient of multiple source areas.	Alluvium
MW025		Alluvium
MW034		Alluvium
MW035		Alluvium
MW044		Alluvium
MW055S		Alluvium
MW055D		Walloon Coal Measures
MW056S	Wells are adjacent to off-Base Bremer River. These locations are down-gradient of multiple source areas.	Alluvium
MW056I		Tertiary Formation

Table 4 presents the surface water and sediment sampling locations and surface water feature sampled, with the locations presented in **Figure 5**, **Appendix A**.

Table 4 Surface water and sediment sampling locations

Area	Sampling Locations	Number of Locations
On-Base Drains	SD/SW002, SD/SW003, SD/SW008, SD/SW011, SD/SW021, SD/SW027, SD/SW028, SD/SW030, SD/SW033, SD/SW037, SD/SW038, SD/SW041, SD/SW048, SD/SW049, SD/SW053, SD/SW056, SD/SW059, SD/SW064, SD/SW067, SD/SW076, SD/SW079, SD/SW080	22
Warrill Creek	SD/SW004, SD/SW005, SD/SW009, SD/SW015, SD/SW016, SD/SW018, SD/SW020, SD/SW026, SD/SW034, SD/SW043, SD/SW099, SD/SW100	12
Bremer River	SD/SW025, SD/SW036, SD/SW039, SD/SW040, SD/SW045, SD/SW047, SD/SW050, SD/SW051, SD/SW052, SD/SW088, SD/SW089, SD/SW090, SD/SW091, SD/SW094, SD/SW098	15

A summary of the OMP monitoring events completed in accordance with the SAQPs between March 2021 and May 2023 is provided in **Table 5**.

Table 5 Summary of monitoring events

Monitoring Event (Sampling dates)	Scope as per SAQP	Samples Collected	Analysis
Biannual Sampling – March/April 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2021c) (30 March – 21 April 2021)	46 GW samples	38 GW samples	PFAS suite
	49 SW samples	48 SW samples	
	49 SD samples	49 SD samples	
	Download 7 data loggers	Download 7 data loggers	None
Biannual Sampling – October 2021 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022a) (18 – 28 October 2021)	46 GW samples	40 GW samples	PFAS suite
	49 SW samples	48 SW samples	
	49 SD samples	49 SD samples	
	Download 7 data loggers	Download 6 data loggers	None
Biannual Sampling – March/April 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2022d) (28 March – 6 April 2022)	40 GW samples	40 GW samples	PFAS suite
	49 SW samples	48 SW samples	
	49 SD samples	49 SD samples	
	Download 7 data loggers	Download 6 data loggers	None
Biannual Sampling – October/November 2022 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2023a) (18– 28 October and 9 November 2022)	40 GW samples	38 GW samples	PFAS suite
	49 SW samples	45 SW samples	
	49 SD samples	45 SD samples	
	Download 7 data loggers	Download 5 data loggers	None
Biannual Sampling – April/May 2023 Groundwater, Surface Water and Sediment Sampling Event (AECOM, 2023c) (17 April – 23 May 2023)	40 GW samples	38 GW samples	PFAS suite
	49 SW samples	47 SW samples	
	49 SD samples	49 SD samples	
	Download 7 data loggers	Download 6 data loggers	None

3.2 Deviations from SAQP requirements

The work undertaken during the monitoring period complied with the most recent version of the SAQPs (AECOM, 2021a, 2022b, c, 2023b) except for the deviations summarised in **Table 6** below. In addition, a discrepancy has been identified on the SAQPs for the upstream monitoring location along Warrill Creek. Figure 3 in the SAQPs shows the sampling location to be SD/SW043, however, Section 4.3 identifies the location as SD/SW070. SD/SW043 is the correct sampling location and was monitored in all five sampling events during the monitoring period.

Table 6 Deviation from SAQP during biannual sampling events – March 2021 to May 2023

SAQP Requirement	Sampling Event Description	Impact of Deviation on Data Set
March/April 2021 Sampling Event		
Collection of groundwater samples from 46 locations	Eight monitoring wells identified in the SAQP were not sampled as discussed below: • MW015, MW039, MW040 and MW056, were destroyed during construction of new infrastructure. • MW008 and MW009 were damaged and could not be sampled. • MW041 and MW049 could not be located due to the presence of long grass (at MW041) and a fallen tree (MW049).	The 2020 annual IR (AECOM, 2021b) identified that the loss of the six wells impacts the ongoing monitoring program by reducing the availability of groundwater monitoring data down-gradient of one of the main potential source areas, the former topside aviation FTA and current FTA pad (CPSA A). There are limited data available for assessment of the extent of PFAS in groundwater. The non-sampling of two wells (MW041 and MW049) is considered of low significance as down-gradient wells were monitored during the sampling event.
Collection of surface water samples from 49 locations	One on-Base drain location was dry (SW048).	As the location was dry, there were no PFAS migrating in surface water at the time of the visit.
Collection of groundwater samples by Hydrasleeve™	The groundwater sample from monitoring well MW054S was collected by bailer as there was insufficient water for Hydrasleeve™ sampling.	There is not expected to be an impact by using the bailer to collect the groundwater sample as this is an accepted method for groundwater sample collection in instances where low well volumes are present.
October 2021 Sampling Event		
Collection of groundwater samples	Six wells identified in the SAQP were not sampled: • MW015, MW039, MW040 and MW056, were destroyed during construction of new infrastructure. • MW008 and MW009 were damaged and could not be sampled.	The 2020 AIR (AECOM, 2021b) identified that the loss of the six wells impacts the program by reducing the availability of groundwater monitoring data down-gradient of one of the main potential source areas, the former topside aviation FTA and current FTA pad (CPSA A). There are limited data available for assessment of the extent of PFAS in groundwater.
Collection of 49 surface water samples	One on-Base drain location was dry (SW048).	As the location was dry, there were no PFAS migrating in surface water at the time of the visit.
Collection of groundwater samples by Hydrasleeve™	The groundwater samples collected from monitoring wells MW048 and MW049 were collected by bailer as there was insufficient water for Hydrasleeve™ sampling.	There is not expected to be an impact by using bailing.

SAQP Requirement	Sampling Event Description	Impact of Deviation on Data Set
Collection of water quality parameters at all groundwater sampling locations	Quality parameters for groundwater at MW031 were inadvertently not collected prior to the sampling of the well.	The non-collection of these data has minimal impact on the sampling program as a large dataset has been collected to date.
Collection of field blank for each day fieldwork is complete.	A field blank was inadvertently not collected during a resampling visit conducted on 26 November 2021 to verify groundwater analytical results in two of the monitoring wells.	No impact to the program. PFAS are not volatile so are unlikely to be detected in field blanks.
March/April 2022 Sampling Event		
Collection of 49 surface water samples	One on-Base drain location was dry (SW067).	As the location was dry, there were no PFAS migrating in surface water at the time of the visit.
Download of seven dataloggers	The datalogger in MW032 was found to be not functioning. This was replaced in June 2022.	No groundwater level data were collected for MW032 between the previous sampling event in October 2021 and June 2022 and fluctuations in groundwater level during this period are not known. This reduces understanding of the groundwater elevations in this portion of the Management Area.
Collection of sediment samples from 49 locations	Sediment samples were collected by grab sample using a clean pair of nitrile gloves rather than being collected using a trenching shovel or piston sampler, as specified in the SAQP.	There is not expected to be an impact due to the use of a different sampling technique.
Collection of field parameter data	The SAQP did not specify whether field parameters should be collected before or after collection of the water sample. During the sampling event, all field measurements were collected before sampling. The probe on the water quality meter was decontaminated prior to measurements being collected from each water sample.	There is not expected to be an impact on the program as field measurements can be collected before or after sampling.
October / November 2022 Sampling Event		
Collection of 40 groundwater samples and download of seven dataloggers	Due to the presence of dense vegetation, off-Base monitoring wells MW056S and MW056I were unable to be sampled and the dataloggers within these wells could not be retrieved and downloaded.	The non-sampling of these locations reduces the spatial coverage of the groundwater monitoring network to the east of the Base. The non-retrieval of the data during this event delays the evaluation of groundwater elevations.

SAQP Requirement	Sampling Event Description	Impact of Deviation on Data Set
Collection of 49 surface water samples and 49 sediment samples	Two surface water / sediment locations were not accessible as they were in construction zones (SW/SD011, and SW/SD076) and one location (SW/SD050) was not accessible due to Base conditions.	The non-sampling of SW/SD011 and SW/SD076 means there are no data available to evaluate PFAS concentrations at these drain locations. The non-sampling of SW/SD050, which is located along the Bremer River, is of lower significance as there are data available from sampling locations further downstream.
Analysis of all surface water and sediment samples for PFAS	The sample bottles for samples SW028 and SD009 were transferred to the laboratory but could not be found for analysis.	The non-analysis of these samples, which are located along Warrill Creek is of low significance as there are data available from sampling locations further downstream.
Installation of Hydrasleeves™ to the target depth in the SAQP	The Hydrasleeve™ installed in monitoring well MW023 was installed at 8.7 metres below top of casing (m bTOC) compared to the target depth of 11 m bTOC.	The Hydrasleeve™ was still within the screened interval so there was no impact on the quality of the data.
Collection of samples in October 2022	Due to the wet conditions during October 2022, five groundwater monitoring wells could not be safely accessed and were sampled approximately two weeks later in November 2022.	The delay of two weeks in sampling five of the wells is considered to be a relatively short period and is unlikely to impact the ongoing monitoring program.
Download of seven dataloggers	Dataloggers from MW056S and MW056I could not be retrieved as the wells could not be found due to the presence of heavy vegetation. Data from all other locations were downloaded. During the sampling event in April 2022, the datalogger in MW032 was found to be not functioning. The datalogger was replaced in June 2022.	Dataloggers download at MW056S and MW056I will be attempted during the next sampling event. The non-retrieval of the data during this event delays the evaluation of groundwater elevations. Groundwater level data in MW032 were not available for the period April to June 2022. As groundwater level data were not available, this reduces the understanding of groundwater level changes in 2022 at this portion of the Base near the Warrill Creek.
LOR for water samples	Due to matrix interference during the analysis of the groundwater sample from MW044, the LOR were raised for sum of PFHxS and PFOS above the drinking water guideline value and PFOS above the ecological 95% freshwater species protection guideline value.	No impact to OMP program. Duplicate and triplicate samples were also collected from MW044. The triplicate sample, analysed at NMI was not affected by matrix interference and consequently the triplicate results were used for assessment purposes in this report.
April / May 2023 Sampling Event		
Collection of 40 groundwater samples	Due to the presence of dense vegetation, off-Base monitoring wells MW056S and MW049 were unable to be sampled.	The non-sampling of these locations reduces the spatial coverage of the groundwater monitoring network to the south and east of the Base.

SAQP Requirement	Sampling Event Description	Impact of Deviation on Data Set
Collection of 49 surface water samples	Surface water samples SW033 and SW038 were not collected as these locations as they were dry at the time of sampling.	The non-sampling of these wells means no data were available to evaluate PFAS concentrations at these locations. The absence of water means there was no PFAS migrating at the time of the visit.
Download of seven dataloggers	The datalogger in MW055S was found to be not functioning. Groundwater level data in MW028 and MW056I between February and April 2023 were not available. The datalogger within MW056S could not be retrieved and downloaded as the well could not be found.	The datalogger in MW055S was replaced in May 2023. The dataloggers in MW028 and MW056I were retrieved and reinstalled. The non-collection of groundwater level at MW055S, MW056S, MW028 and MW056I reduces the understanding of groundwater level changes in 2023 at the eastern portion of the Base near Bremer River.
Collection of groundwater samples by Hydrasleeve™	Two monitoring wells, MW024 and MW031, were sampled by bailing.	Overall, there is not expected to be an impact by using bailing. However, the groundwater sample from MW024 reported a new maximum sum of PFAS and PFHxS concentration. As the laboratory reported the limits of reporting (LOR) for PFAS were raised due to matrix interference, the elevated concentrations may be due to the presence of sediment in the bailed sample. Whilst bailing is an acceptable sample collection method, the reliability of the data may be affected.
Collection of samples in April 2023	Due to military exercises during the sampling event, access to one portion of the Base (Hansens Farm Conservation Area) was restricted until 23 May, delaying the collection of ten samples by three weeks.	The relatively short delay is unlikely to impact the ongoing monitoring program.
Collection of dissolved oxygen measurements	Due to a fault with the dissolved oxygen sensor on the water quality meter, dissolved oxygen measurements could not be collected for 12 water samples.	The non-collection of these data has minimal impact on the sampling program as a large dataset has been collected to date.
Collection of 49 surface water samples	Sample SW018 was collected from the drainage channel entering Warrill Creek instead of from Warrill Creek.	An elevated PFAS concentration was detected in the sample. The sample results from this location have been disregarded as the sample is not considered representative of sample location SW018. The result has been removed from the dataset.

4.0 Quality Assurance and Quality Control

Data validation pertaining to the data in this report has been previously completed and discussed within the individual factual reports presented in **Appendix F** and listed below:

- Sampling Event Factual Report, March/April 2021 – PFAS OMP – RAAF Base Amberley, February 2022 (AECOM, 2021c).
- Sampling Event Factual Report, October 2021 – PFAS OMP – RAAF Base Amberley, February 2022 (AECOM, 2022a).
- Sampling Event Factual Report, March/April 2022 – PFAS OMP – RAAF Base Amberley, September 2022 (AECOM, 2022d).
- Sampling Event Factual Report, October/November 2022 – PFAS OMP – RAAF Base Amberley, January 2023 (AECOM, 2023a).
- Sampling Event Factual Report, April/May 2023 PFAS OMP – RAAF Base Amberley, September 2023 (AECOM, 2023c).

Data validation procedures employed in the assessment of the field and laboratory quality assurance/quality control (QA/QC) data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of the factual and interpretive reports.

5.0 Assessment Criteria

Adopted assessment criteria references national guidance in the form of the PFAS National Environmental Management Plan (NEMP), Heads of Environmental Protection Agencies (HEPA) (2020), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. At the time of preparing this report, a number of guidance documents were available in Australia including:

- PFAS NEMP, version 2.0, January 2020 (HEPA, 2020).
- National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999, Schedule B1, as amended in 2013 (NEPC, 2013).

The adopted PFAS assessment criteria to assess the data generated as part of the monitoring are presented in **Table 7** below. The adopted assessment criteria are in accordance with the PFAS screening criteria nominated in the PMAP (Defence, 2020).

Table 7 Summary of adopted assessment criteria

Pathway	Compound	Criteria	Comment / reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values are from the PFAS NEMP (HEPA, 2020) and adopted PFAS Screening Criteria in the OMP. *All groundwater results were compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values presented are from PFAS NEMP (HEPA, 2020), which are sourced from National Health and Medical Research Council (NHMRC) (2019) and adopted PFAS Screening Criteria in the OMP. *All surface water results were compared to these criteria.*
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (95% species protection values)	PFOS	0.13 µg/L	The values are from the PFAS NEMP (HEPA, 2020) and adopted PFAS Screening Criteria in the OMP. *All surface water and groundwater results were compared to these criteria.*
	PFOA	220 µg/L	
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	
	PFOA	19 µg/L	

At the time this report was prepared no HEPA (2020) endorsed criteria were available in Australia for PFAS in sediment.

It is noted that for the purpose of presenting data within this report, AECOM has focussed on PFOA, PFOS and sum of PFOS and PFHxS, i.e., those PFAS for which there is either human health and/or ecological assessment criteria available in Australia.

6.0 Contextual and Ancillary Information

6.1 Remediation Projects

No remediation projects in response to PMAP actions (Defence, 2020) were completed during the monitoring period.

During 2022, soil investigation activities were completed at CPSA A (former topside aviation fire training area) and CPSA D (sewage treatment plant) to close out data gaps and support the development of a remediation action plan (RAP) for these CPSAs in 2023. Over the next year, Defence will develop RAPs for soil and groundwater for the main source areas at the Base as part of the PMAP delivery project. Remediation activities are estimated to commence within the next two years, following the finalisation of the RAPs. A mass flux study to understand transport pathways is being conducted by Defence and is in preparation at the time of preparing this report.

A small amount of data were available in the Defence database for sediment samples collected in August 2021 as part of the PMAP delivery project from on-Base drainage feature discharge points. These data have been considered in this report. **Table 8** below summarises the location of the samples and discharge points and sum of PFHxS and PFOS concentrations. Full results are presented in **Table T5**, **Appendix B**. The locations of the discharge points are shown on **Figure 5**, **Appendix A**.

Table 8 Sediment samples collected as part of the PFAS Delivery Project in August 2021

Sediment Sample	Discharge Point	Discharge Location	Sum of PFHxS and PFOS (mg/kg)
SD518	DP1	Bremer River	<0.0002
SD520	DP8	Bremer River	0.0191 - 0.024
SD521	DP14	Warrill Creek	0.258
SD522	DP15	Warrill Creek	0.0212
SD523	DP16	Warrill Creek	0.0907
SD524	DP17	Warrill Creek	0.0838
SD525	DP18	Warrill Creek	3.15
SD526	DP19	Warrill Creek	0.012
SD527	DP20	Warrill Creek	0.0089
SD528	DP21	Warrill Creek	0.0353
SD529	DP23	Warrill Creek	0.0648
SD530	DP24	Warrill Creek	0.0232

6.2 Infrastructure Projects

A summary of recent and planned infrastructure projects on Base is provided in **Appendix C**. The details were originally provided by the Environment and Sustainability Manager South Queensland – RAAF Base Amberley in February 2021 with updates provided by the RAAF Base Amberley Environment and Sustainability Manager in February 2022 and April 2023.

During the monitoring period, none of the infrastructure projects identified in **Appendix C** involved excavation or remediation of PFAS impacted soils from the key CPSA, in particular CPSA A, D, N and V. Therefore, these infrastructure projects are unlikely to have affected the PFAS OMP data.

A project to design and construct a STP reached the 100% final design in 2023. The existing STP (CPSA D) was identified as having a high relative contribution to risk, refer to **Section 2.3**. Construction of the new STP commenced in April 2023 and is expected to be completed by the end of 2024. The old STP will be decommissioned (but not remediated) following commissioning of the new plant.

Any infrastructure works involving soil disturbance and reuse, movement and stockpiling of soil on-Base are managed as per Defence environmental guidelines including the Defence PFAS Construction and Maintenance Framework (Defence, 2021), the Defence Contamination Management Manual (Defence, 2018 amended 2021) (in particular Annex K which details the management, reuse and stockpiling of PFAS impacted soil) and the Pollution Prevention Management Manual (Defence, 2017).

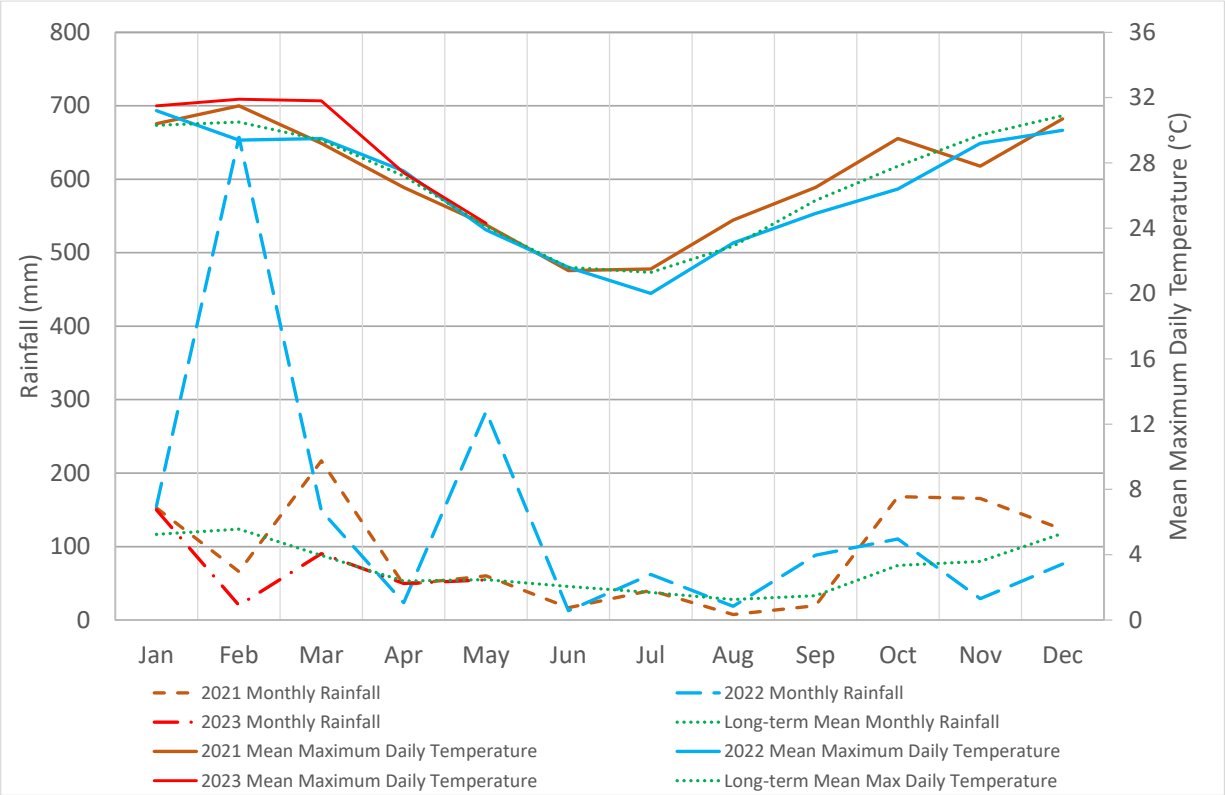
6.3 Significant Weather Events

Rainfall and temperature measurements in the period March 2021 to May 2023 from the Bureau of Meteorology (BoM) monitoring station at Amberley (Station Number 04004) are shown in **Chart 1** together with long term (1941 to 2023) mean monthly total rainfall and long term mean maximum daily temperatures. The mean annual rainfall at Amberley is 867.7 millimetres (mm) per year.

The BoM monitoring station (040004) reported higher than average rainfall for 2021 with 1083.9 mm recorded during the year. The recorded rainfall in March and April 2021, during the post-wet season sampling event was 265 mm which was 1.9 times higher than the mean rainfall for this period of 140.8 mm. The reported rainfall during October 2021 was 167.8 mm which was 2.2 times higher than the mean rainfall of 73.8 mm.

The BoM monitoring station (040004) reported approximately double the annual average rainfall for 2022 with 1,666.0 mm recorded. The higher rainfall totals are due to the occurrence of a La Niña event between 2021 and 2022. La Niña is a phase of the natural climate cycle (El Nino-Southern Oscillation) and results in increased rainfall in Australia.

Chart 1 Monthly rainfall and mean maximum temperatures at Amberley monitoring Station (04004) from April 2021 to May 2023



The recorded rainfall in March and April 2022 was 172.4 mm which was slightly higher than the mean rainfall for this period of 141.8 mm. The reported rainfall during October 2022 was 110.4 mm which was higher than the mean rainfall of 74.3 mm.

An intense rainfall event (574 mm) occurred between 25 and 28 February 2022 which caused localised flooding along Frog's Hollow Gully, Bremer River and Warrill Creek. The extent of the flooding is uncertain. Another large rainfall event occurred between 12 and 15 May 2022 with 178.8 mm recorded.

The 2023 data indicate lower than average rainfall during the first five months of the year compared to the long-term mean rainfall, indicating a change to El Niño (drier) conditions.

The higher-than-average rainfall conditions recorded during most of the monitoring period has the potential to impact on the interpretation of the data in the following ways:

- In rainfall dependent aquifers, such as the regional setting of the Base, higher than average rainfall can result in higher water tables causing dilution of the aquifer, and potentially affecting the distribution of PFAS compounds within the water column. This may result in lower than previously reported concentrations of PFAS in affected monitoring well locations (see **Section 8.3**).
- Higher than average rainfall can result in higher flow rates in surface water bodies resulting in an increased mass flux of PFAS migration from the Base via surface water, resulting in lower reported concentrations in these water bodies due to dilution with rainwater (see **Section 8.3**).

7.0 Monitoring Data Summary

The following five scheduled biannual monitoring events were completed by AECOM over the monitoring period (26 months):

- March/April 2021 Sampling Event, February 2022 (AECOM, 2021c).
- October 2021 Sampling Event, February 2022 (AECOM, 2022a).
- March/April 2022 Sampling Event, September 2022 (AECOM, 2022d).
- October/November 2022 Sampling Event, January 2023 (AECOM, 2023a).
- April/May 2023 Sampling Event, June 2023 (AECOM, 2023c in draft).

The sample locations are shown on **Figure 4** and **Figure 5** (**Appendix A**). Groundwater elevations for the monitoring period are shown on **Figure 6** to **Figure 15** (**Appendix A**). Results are summarised in following sections and on **Figures 16** to **55** (**Appendix A**).

The monitoring and analytical results are provided in **Tables T1** to **T5** in **Appendix B**.

In addition to the OMP data, AECOM also considered a small amount of sediment data for the Base that were available in the Defence database during the monitoring period, refer to **Section 6.1**.

7.1 Groundwater Results

7.1.1 Groundwater field observations

The groundwater field observations recorded in the sampling events between March 2021 and May 2023 are presented in **Table T1** in **Appendix B**. In summary:

- Oil sheens were not observed in any of the samples.
- In 2021, organic odours were recorded in six wells (MW022, MW033, MW047, MW55S, MW056I, MW057I) with sulfuric odours recorded in five wells (MW042, MW043, MW046, MW047, MW055D).
- In 2022, a hydrocarbon odour was recorded in two wells (MW041 and MW042), sulfuric odours were recorded in four wells (MW002, MW034, MW044, MW057I) and weak septic odours in two wells (MW056S and MW056I).
- In April/May 2023, groundwater in one well (MW033) recorded a sulfuric odour and groundwater from five wells recorded an organic odour (MW041, MW043, MW044, MW046 and MW56I).

7.1.2 Groundwater elevations

Groundwater elevations calculated from the gauging data collected during the sampling events are summarised in **Table 9**, and presented in **Table T1** in **Appendix B** and on **Figures 6 to 15 in Appendix A**. The groundwater elevations in the Alluvium – Tertiary Formation and Walloon Coal Measures aquifers during the sampling events are similar, indicating that there are no large differences in groundwater level between wet and dry season conditions. Note that groundwater in the Alluvium and Tertiary Formation aquifers are in hydraulic continuity. Groundwater in the Walloon Coal Measures is considered to represent a separate aquifer.

The groundwater elevations are generally consistent with previous sampling events DSI (CH2M Hill, 2018), 2019 monitoring reports (CH2M Hill, 2020a, b) and 2020 AIR (AECOM, 2021b).

Table 9 Summary of groundwater elevations during the sampling events between March 2021 and May 2023

Sampling Event	Range in groundwater elevation (mAHD) (No. of wells)	
	Quaternary Alluvium - Tertiary Formation	Walloon Coal Measures
March/April 2021	5.164 to 28.726 (31)	15.481 to 34.562 (6)
October 2021	5.322 to 28.805 (30)	15.566 to 36.362 (7)
March/April 2022	9.783 to 28.795 (32)	14.056 to 36.638 (7)
October / November 2022	9.767 to 28.976 (30)	14.311 to 39.619 (7)
April/May 2023	8.730 to 28.997 (30)	14.040 to 38.093 (7)

Note: **Section 3.1** outlines the groundwater wells within each aquifer.

7.1.3 Data loggers

Continuous level logging was recorded at targeted groundwater monitoring wells as outlined in the SAQPs. Hydrographs are presented in **Appendix D** (**Chart D1** to **D4**) to assist in evaluating and interpreting hydrogeological conditions at the time of monitoring. Rainfall data from Amberley (BoM station 040004) are also presented. Observations are summarised in **Table 10**.

Table 10 Continuous level logging location observations

Type	Well	Aquifer unit	Hydrograph observations
Ground-water hydraulic gradients	MW025	Alluvium	This well showed a response in groundwater elevation of 2.45 m following an intense rainfall event in February 2022. A smaller response in groundwater elevation of 1.23 m occurred between 12 and 15 May 2022 in response to a rain event in May 2022. Refer to **Chart D2**.
	MW028	Alluvium	A large increase in groundwater elevation (6.5 m) was observed during the intense rainfall event in February 2022. A smaller response (increase of 1.44 m) occurred on 26 June 2022. Other months during the monitoring period were stable, neither increasing nor decreasing. Refer to **Chart D2**. The change in groundwater elevation is likely to be associated with surface water effects and connectivity of the aquifer with the nearby Bremer River.
	MW032	Alluvium	There was a large response following wet season rain events in March 2021. Refer to **Chart D2**. Data were not collected during the first part of 2022 as the logger malfunctioned. The logger was replaced in June 2022; however, data were not recorded until September 2022. The reason for this is unknown.
Receiving environment (groundwater paired locations)	MW055S	Alluvium	Showed a response in groundwater elevation of 4.78 m following an intense rainfall event in February 2022. Refer to **Chart D3**. A smaller response in groundwater elevation of 2.78 m occurred between 11 and 15 May 2022. in response to a large rainfall event at this time.
	MW055D	Walloon Coal Measures	The logger in this well was found to have failed and stopped recording data at the beginning of March 2021. The logger was replaced in January 2022. No response to rainfall was recorded during the intense rainfall event in February 2022, however, a change in groundwater elevation of 1.7 m occurred

Type	Well	Aquifer unit	Hydrograph observations
			in May 2022 (at the same time as the increase in MW055S and MW025), in response to a large rainfall event. See **Chart D3**.
	MW056S	Alluvium	Both MW056S and MW056I show similar hydrograph profiles with large changes in groundwater level following the rainfall event in February 2022. MW056I, screened in the Tertiary Formation, showed larger changes in groundwater elevation (13.2 m in February 2022) compared to the groundwater level in MW056S, up to March 2022, refer to **Chart D4**. The change in groundwater elevation is likely to be associated with surface water effects and connectivity of the aquifer with the nearby Bremer River. The change in elevation has the potential to affect contaminant migration. This is discussed in **Section 8.1**.
	MW056I	Tertiary Formation	

7.1.4 Groundwater flow directions

Inferred groundwater contour maps for the Alluvium – Tertiary Formation aquifer for the five sampling events are presented in **Appendix A** in **Figure 6** (April 2021), **Figure 8** (October 2021), **Figure 10** (March/April 2022), **Figure 12** (October 2022), **Figure 14** (April/May 2023).

The inferred groundwater contours for all five sampling events were similar with the contours indicating radial flow in the central western portion of the Base with flow towards the northeast, east and southeast in the directions of Bremer River and Warrill Creek.

Inferred groundwater contours maps for the Walloon Coal Measures aquifer for the five sampling events are presented in **Appendix A** in **Figure 7** (April 2021), **Figure 9** (October 2021, **Figure 11** (March/April 2022), **Figure 13** (October/November 2022), **Figure 15** (April/May 2023). The inferred groundwater contours for both monitoring periods were similar with the contours indicating flow is generally from west to east.

The inferred flow directions are consistent with previous sampling events reported in the DSI (CH2M Hill, 2018), 2019 monitoring reports (CH2M Hill, 2020a, b) and 2020 AIR (AECOM, 2021b). This is further discussed in **Section 8.1.1**.

7.1.5 Groundwater Quality Parameters

The water quality parameters measured during sample collection at RAAF Base Amberley during the monitoring period are presented in **Table 11** and **Table 12**, respectively, and in **Table T1** in **Appendix B**.

Table 11 Summary of quality parameters in groundwater from monitoring wells screened in the Alluvium – Tertiary Formation

	DO (mg/L)					EC (µS/cm)

Mean	23.5	25.2	24.8	23.9	23.4					

Notes: DO = dissolved oxygen, EC = electrical conductivity, Eh = corrected oxidation reduction potential, Temp = temperature.

Based on the mean groundwater parameter results over the sampling period, the aquifer units at RAAF Base Amberley can be characterised as follows:

- **Alluvium – Tertiary Formation** is near neutral, poorly to mildly oxygenated, mildly reducing and fresh to brackish.
- **Walloon Coal Measures** is near neutral, poorly oxygenated, mildly reducing and brackish to saline.

New minimum electrical conductivity measurements in April/May 2023 were recorded in 19 water samples with eight of the samples recording approximately one order of magnitude decreases, affecting samples from all aquifers. The reason for the decrease is unknown and potentially may indicate a faulty sensor on the water quality meter.

Notwithstanding the issue with electrical conductivity measurements in April/May 2023, the parameter results for the monitoring period are generally consistent with previous findings (CH2M Hill, 2018, CH2M Hill, 2020b, AECOM 2021b) and therefore the higher-than-average rainfall in 2021 and 2022 does not appear to have affected the groundwater quality parameters.

7.1.6 Groundwater Analytical Results

Groundwater analytical results are presented in **Table T2** in **Appendix B** and monitoring activities are summarised in the OMP Sampling Event Factual Reports provided in **Appendix F**.

Groundwater sample results from March/April 2021, October/November 2021, March/April 2022, October/November 2022, and April/May 2023 are presented spatially on **Figures 16** to **Figure 35** in **Appendix A**.

The interpretive assessment of these results is discussed in **Section 8.0**.

A summary of analytical results for PFOA, PFOS and Sum of PFOS and PFHxS concentrations in groundwater collected between March 2021 and May 2023 is provided in **Table 13**.

Deviations from the historical dataset for groundwater are summarised in **Table 14**, below and graphically on the temporal trend graphs for different geographical areas of the Base (**Chart D5** to **D9**) in **Appendix D**.

Table 13 Summary of PFOA, PFOS and Sum of PFOS and PFHxS concentrations in groundwater

Sampling Event	No. of Samples	Compound	Concentration Range (µg/L) in Sampling Event	No. of Samples with Concentration > LOR	No. of Exceedances of Human Health Criteria (Drinking Water)	No. of Exceedances of Ecological Criteria (99% species protection)	No. of Exceedances of Ecological Criteria (95% species protection)
March/April 2021	38	PFOA	<0.01 to 40.3 µg/L	15	7	1	0
		PFOS	<0.01 to 293 µg/L	29	NA	29	16
		PFOS+PFHxS	<0.01 to 420 µg/L	30	20	NA	NA
October 2021	40	PFOA	<0.01 to 21.7 µg/L	18	8	1	0
		PFOS	<0.01 to 194 µg/L	26	NA	26	15
		PFOS+PFHxS	<0.01 to 277 µg/L	27	20	NA	NA
March/April 2022	40	PFOA	<0.01 to 22.1 µg/L	18	6	1	0
		PFOS	<0.01 to 179 µg/L	27	NA	27	21
		PFOS+PFHxS	<0.01 to 264 µg/L	30	23	NA	NA
October/November 2022	38	PFOA	<0.01 to 31.6 µg/L	16	6	1	0
		PFOS	<0.01 to 215 µg/L	25	NA	25	16
		PFOS+PFHxS	<0.01 to 335 µg/L	27	22	NA	NA
April/May 2023	38	PFOA	<0.01 to 7.8 µg/L	18	8	0	0
		PFOS	<0.01 to 92.8 µg/L	28	NA	28	20
		PFOS+PFHxS	<0.01 to 142 µg/L	29	22	NA	NA

Notes:

NA = Not applicable, No. of samples does not include QA samples. Concentration ranges includes QA samples.

7.2 Surface Water Results

7.2.1 Surface water field observations

The surface water field observations recorded in the sampling events between March 2021 and May 2023 are presented in **Table T3** in **Appendix B**. In summary:

- In March/April 2021, organic odours were recorded at eight sample locations (SW021, SW037, SW038, SW041, SW045, SW059, SW064, SW079) with biosheens observed in eight sample locations (SW008, SW011, SW025, SW027, SW041, SW059, SW079, SW080).
- In October 2021, organic odours were recorded at eight sample locations (SW008, SW021, SW030, SW033, SW037, SW041, SW056, SW059). Sulfuric odours were observed at two locations (SW076 and SW080). Sheens were observed at seven locations (SW002, SW030, SW037, SW038, SW041, SW067, SW080).
- In 2022 sampling events, no odours or sheens were observed.
- In April/May 2023, organic odours were recorded at SW015, SW025, SW026, SW040, SW043, SW045, SW051, SW053, SW064, SW067, SW079, SW080, SW098, SW099, SW100). A slight biosheen was observed during monitoring of SW041.

Most odours and sheens were observed at drain locations where water was stagnant.

7.2.2 Surface water quality parameters

Surface water quality parameters were measured prior to collecting surface water samples. The stabilised readings for the sampling events during the monitoring period are presented in the sampling event factual reports (**Appendix F**) and in **Table T3**, **Appendix B**. A summary of the water quality parameters in Bremer River, Warrill Creek and on-Base drains for the sampling events are presented in **Table 15**, **Table 16** and **Table 17**.

Table 15 Summary of surface water quality parameter results: Bremer River

Notes: DO = dissolved oxygen, EC = electrical conductivity, Eh = corrected oxidation reduction potential, Temp = temperature.

Based on the mean results the drainage channel water and creek water are comparable and can be characterised as near neutral, moderately to well oxygenated, mildly reducing and fresh. This is consistent with previous results (CH2M Hill, 2018, CH2M Hill, 2020b, AECOM, 2021b).

7.2.3 Surface water analytical results

Surface water analytical results for the sampling events are presented in **Table T4** in **Appendix B**. Monitoring activities and laboratory analytical reports are presented in the OMP sampling event factual reports in **Appendix F**. A summary of the surface water analytical results during the monitoring period is provided in **Table 18**. Deviations from the historical dataset are provided in **Table 19**.

Surface water sample results for sum of PFOS and PFHxS and PFOA[9] for each of the five sampling events between March 2021 and May 2023 are presented in **Figure 36** to **Figure 45** in **Appendix A**.

Historical surface water concentrations of sum of PFOS and PFHxS have been displayed graphically on temporal trend charts by water body type (**Charts 10** to **12**, **Appendix D**) and are discussed in **Section 8.3**.

[9] Figures showing PFOS have not been included as the data presented would be similar to the sum of PFOS and PFHxS figures.

Table 18 Summary of PFOA, PFOS and PFOS+PFHxS Concentrations in Surface Water

Sampling Event	No. of Samples[1]	Compound	Concentration Range (µg/L) in Sampling Event	No. of Samples with Concentration > LOR	No. of Exceedances of Human Health Criteria	No. of Exceedances of Ecological Criteria (99% species protection)	No. of Exceedances of Ecological Criteria (95% species protection)
March/April 2021	48	PFOA	<0.01 to 7.7 µg/L	20	0	0	0
		PFOS	<0.01 to 63.8 µg/L	38	NA	38	20
		PFOS+PFHxS	<0.01 to 108 µg/L	38	16	NA	NA
October 2021	48	PFOA	<0.01 to 2.7 µg/L	19	0	0	0
		PFOS	<0.01 to 78.6 µg/L	35	NA	35	21
		PFOS+PFHxS	<0.01 to 101 µg/L	35	12	NA	NA
March/April 2022	48	PFOA	<0.01 to 4.5 µg/L	21	0	0	0
		PFOS	<0.01 to 31.4 µg/L	38	NA	38	21
		PFOS+PFHxS	<0.01 to 60 µg/L	38	13	NA	NA
October/November 2022	45	PFOA	<0.01 to 1.9 µg/L	17	0	0	0
		PFOS	<0.01 to 17.5 µg/L	30	NA	30	24
		PFOS+PFHxS	<0.01 to 24.6 µg/L	30	7	NA	NA
April/May 2023	47	PFOA	<0.01 to 1.1 µg/L	20	0	0	0
		PFOS	<0.01 to 23.9 µg/L	38	NA	38	22
		PFOS+PFHxS	<0.01 to 45.9 µg/L	38	15	NA	NA

Notes:

NA = Not applicable, No. of samples does not include QA samples. Concentration ranges includes QA samples.

7.3 Sediment Results

7.3.1 Sediment field observations

Sediment field observations are presented in **Table T4** in **Appendix B**. The sediment observations during the monitoring period generally comprised sandy silt, sand, silty clay or silt which were light brown to dark brown or light grey to grey, and generally included organic matter in the form of rootlets and/or algae and/or leaves.

7.3.2 Sediment analytical results

Sediment samples were co-located and collected with surface water samples during the sampling events between March 2021 and May 2023. Sediment PFAS analytical results are presented in **Table T5** in **Appendix B**. Monitoring activities and laboratory analytical certificates are presented in the sampling event factual reports in **Appendix F**. Sediment sample results for sum of PFOS and PFHxS and PFOA during the monitoring period are presented in **Figure 46** to **Figure 55**, in **Appendix A**. A summary of the sediment results is presented in **Table 20**. Deviations from the historical dataset for sediment are provided in **Table 21**.

There were no first-time detections of PFAS in sediment samples collected during the monitoring period. Trend analysis has not been conducted for sediment samples.

Table 20 Sediment analytical results summary

Sampling Event	No. of Samples	Compound	Concentration Range in Sampling Event	No. of Samples[1] with Concentration > LOR
March/April 2021	49	PFOA	<0.0002 – 0.0195 mg/kg	18
		PFOS	<0.0002 – 0.915 mg/kg	45
		PFOS+PFHxS	<0.0002 – 1.000 mg/kg	43
August 2021 (PMAP Delivery)	14	PFOA	<0.0002 – 0.0059 mg/kg	7
		PFOS	<0.002 – 3.13 mg/kg	13
		PFOS+PFHxS	<0.0002 – 3.15 mg/kg	13
October 2021	49	PFOA	<0.0002 – 0.0116 mg/kg	20

8.0 Interpretive Analysis

8.1 Hydrogeology

8.1.1 Groundwater elevation and flow

The inferred groundwater flow directions in the Alluvium - Tertiary Formation aquifer and Walloon Coal Measures in the five sampling events during the monitoring period were consistent with previous reports with groundwater predominantly flowing towards the east, as discussed in **Section 7.1.4**. Close to the western boundary of the Base, there is the potential for groundwater in the Walloon Coal Measures to flow to the west towards the coal mine which is located beyond the western Base boundary. Additional monitoring points beyond the western boundary would be required to confirm this flow direction. The area of the coal mine to the west was considered in the 2018 DSI (CH2M Hill, 2018) to have a lower risk profile and no complete source-pathway-receptor linkages have been identified.

The hydrographs for targeted groundwater monitoring wells are presented in **Appendix D** (**Chart D1** to **D4**) and show responses of variable magnitude in groundwater elevation to the wet season rainfall events during the monitoring period. Historical groundwater level data (e.g., AECOM, 2021b) have shown that the groundwater elevation across the Base decreases during the dry season before recharging and increasing in elevation in the following wet season. This occurred during 2021 with a decrease in elevation of approximately 2 m. In 2022, this did not occur due to the above average rainfall due to the La Niña conditions (refer to **Section 6.3**) with groundwater elevations rising in the wet season and remaining steady during the dry season (April to October). Regular rainfall events occurred during the dry season 2022, which recharged the aquifer and maintained the elevated groundwater levels.

The hydrographs show responses in groundwater level in monitoring wells screened in all aquifer types (Alluvium, Tertiary Formation and Walloon Coal Measures). Monitoring well MW055S is screened in the Alluvium close to the Bremer River and showed a greater response to rainfall events. This is likely to be due to water flow in the river losing surface water to groundwater and recharging the aquifer. The groundwater elevation in monitoring well MW055D, screened in the Walloon Coal Measures, also showed a relatively large response in May 2022 but did not show a change in groundwater elevation during the large rainfall event in February 2022. The reasons for the variable responses are not known and may relate to the connectivity between surface water and groundwater.

Overall, the logger data indicated responses to rainfall events (or lack of response) that are consistent with datalogger results for 2019 to 2020. The higher seasonal rainfall amount in 2022 relative to annual averages, as noted in **Section 6.3**, resulted in slightly higher groundwater elevations in all wells compared to the 2020 to 2021 period. Relatively lower PFAS concentrations were detected in wells located close to surface water features. Sum of PFOS and PFHxS in groundwater samples from MW055S in 2021 and 2022 were between 0.14 and 0.81 µg/L compared to 2019 to 2021 (sum of PFOS and PFHxS was between 0.85 and 2.0 µg/L). The October 2022 concentration at MW055S was a new minimum concentration recorded demonstrating the dilution effect of large amounts of rainfall on PFAS concentrations within the aquifer. PFAS groundwater concentrations in MW028 in 2022 were also relatively lower with sum of PFOS and PFHxS in the range 4.9 to 16.3 µg/L compared to the range between 2019 and 2021 (30.7 to 60.1 µg/L).

The 2021 to 2023 data provide a line of evidence that the higher rainfall may have resulted in localised decreases in PFAS concentrations in groundwater from wells likely to be hydraulically connected to surface water due to dilution within the aquifer. Conversely, MW025, located close to the Bremer River, showed response to rainfall events and recorded new maximum PFAS concentrations in 2022 (sum of PFOS and PFHxS was 2.44 µg/L).

8.1.2 Vertical gradients

There are three sets of paired monitoring wells at the Base which provide information on vertical flow and potential connectivity between hydrogeological units. An evaluation of the groundwater elevation data is presented in **Table 22** below. The Alluvium / Walloon Coal Measures paired wells MW055S and MW055D indicate hydraulic connection between the aquifers.

Table 22 Paired monitoring wells and vertical gradient interpretation

Well	Aquifer	GW elevation (m AHD) April 2021	GW elevation (m AHD) October 2021	GW elevation (m AHD) March / April 2022	GW elevation (m AHD) October / November 2022	GW elevation (m AHD) April / May 2023	Screen interval (mbgl)	Vertical gradient (m/m)	Direction
MW055S	Alluvium	15.420	15.486	14.505	14.728	13.657	9-12	04/21: -0.003 10/21: -0.004 04/22: 0.022 10/22: 0.020 03/23: -0.002	No gradient.
MW055D	Walloon Coal Measures	15.481	15.566	14.056	14.311	14.044	28-34		
MW056S	Alluvium	8.143	8.275	9.783	Not gauged	Not gauged	6.5-9.5	04/21: 0.350 10/21: 0.347 03/22: -0.003	Potential downward vertical gradient from Alluvium to Tertiary Formation in 2021. Hydraulic connection in March/April 2022.
MW056I	Tertiary Formation	5.164	5.322	9.812	Not gauged	8.730	15-18		
MW057S	Alluvium	9.454	9.499	11.979	12.487	10.787	6.5-9.5	04/21: -0.090 10/21: -0.123 04/22: 0.150 10/22: 0.252	Potential for downward vertical gradient from Alluvium to Tertiary Formation or upward vertical gradient from Tertiary Formation to Alluvium
MW057I	Tertiary Formation	9.991	10.234	11.084	10.974	10.822	12.5-15.5		

A slight upward vertical flow direction between Alluvium and Walloon Coal Measures was reported at MW055S/D in the DSI (CH2M Hill, 2018) and 2020 AIR, and 2021 to 2023 data indicate the aquifers are connected at this location. One Alluvium/Tertiary Formation pair (MW056S/I) indicated potential downward vertical gradient from Alluvium to Tertiary Formation during 2021, however, in March 2022, the measurements did not indicate a gradient and indicated the aquifers were connected. It is noted that the groundwater level in MW056I, which is screened in the Tertiary Formation rose by over 4.5 m compared to 2021 measurements. The change is attributed to the high rainfall event during February 2022, which appears to have affected the groundwater level in MW056I more significantly compared to MW056S. Another pair (MW057S/I) indicated potential for both upward and downward vertical flow between Alluvium and Tertiary Formation. The hydrogeological measurements indicate the potential for flow between the different geological formations. PFAS in groundwater will migrate off-base in flowing groundwater, through interaction between aquifers in accordance with the hydraulic gradient.

8.2 Groundwater Temporal Trends

Groundwater results for sum of PFOS and PFHxS compared to assessment criteria are provided in **Figure 16** to **Figure 25** in **Appendix A** with PFOA results presented in **Figure 26** and **Figure 35**. The relationship between the current (first-time detection or new exceedance) and historical results (range, historical maximum and minimum) is summarised in **Table 13** and **Table 14**, in **Section 7.1.6**.

PFAS concentrations were generally similar to previous (historical) results reported in the DSI (CH2M Hill, 2018), 2019 monitoring reports (CH2M Hill, 2020a, b) and 2020 AIR (AECOM, 2021b).

Temporal changes in PFOS, sum of PFOS and PFHxS and PFOA concentrations have been evaluated using Mann-Kendall analysis (refer to **Appendix D**). Temporal changes in sum of PFOS and PFHxS are also shown on **Charts D5** to **D9** also presented in **Appendix D**. A summary of the Mann-Kendall results is presented in **Table 23**. Overall, most wells have either a stable trend, no trend or a decreasing trend. Fourteen wells have an increasing, or probably increasing, trend of either PFOS, sum of PFOS and PFHxS and PFOA, as summarised in **Table 23**. Mann-Kendall trend analysis was only completed on wells where sufficient historical data are available (equal or greater than eight datapoints at each location) and where at least 20% of the sample results are at detectable concentrations above the LOR.

Table 23 Summary of Mann-Kendall statistical analysis

Analyte	Wells with an increasing trend	Wells with a decreasing trend	Wells with a stable trend or no trend
PFOS	MW012, MW025, MW029, MW030, MW032, MW037, MW043, MW047, MW050, MW054S	MW006, MW007, MW042, MW046, MW048, MW049, MW055S	MW002, MW005, MW020, MW021, MW022, MW023, MW026, MW028, MW031, MW033, MW034, MW036, MW041, MW054D, MW056I, MW056S, MW057S
Sum of PFOS+PFHxS	MW012, MW021, MW024, MW025, MW029, MW030, MW032, MW043, MW047, MW050, MW054S, MW056I	MW006, MW007, MW022, MW042, MW046, MW048, MW049	MW005, MW020, MW023, MW024, MW026, MW028, MW031, MW033, MW034, MW036, MW037, MW041, MW044, MW054D, MW055S, MW056S, MW057I, MW057S
PFOA	MW021, MW029, MW030, MW032, MW047, MW057S	MW007, MW042, MW046, MW048, MW049	MW006, MW020, MW022, MW023, MW028, MW037, MW055S

The highest PFAS concentrations during the monitoring period were detected in monitoring wells located down-hydraulic gradient of the CPSAs identified during the previous investigations. This is consistent with results from 2019 and 2020. The results indicate that sum of PFOS and PFHxS concentrations close to source areas have been variable. The following subsections provide a summary

of the spatial distribution and concentration trends of PFAS in groundwater, at and down-gradient of, each major, moderate and minor source area as listed in **Section 2.3.1**. Monitoring wells are located approximately down-gradient of all major and moderate CPSAs with two exceptions. Due to the loss of MW015, there are no monitoring wells close to CPSA Y. Due to the loss of MW039 and MW040, MW008 and MW009, there are limited groundwater data available down-gradient of CPSA A. This has been considered when assessing the data.

Further discussion of the groundwater results for the major source areas is provided in **Section 8.2.1** to **8.2.12**.

8.2.1 CPSA A Former Topside Aviation Training Area and Current FTA Pad

The PMAP identified the former topside aviation training area and current FTA pad to be one of the key PFAS source areas at the Base, presenting a high relative contribution to risk. Groundwater beneath CPSA A flows to the northeast. Due to the loss of monitoring wells close to CPSA A (e.g. MW039, MW040) and down-gradient (i.e. MW009), there is limited monitoring well coverage adjacent to and down-gradient of this source area, refer to **Figure 2** in **Appendix A**. There is currently one well within the CPSA A (MW033) and two wells on the CPSA A boundary (namely MW002 and MW046).

Monitoring wells MW002 and MW033 are screened in the Walloon Coal Measures to the northwest and cross-hydraulic gradient of CPSA A, respectively. Except for trace concentrations of sum of PFOS and PFHxS (0.02 µg/L) in MW002 in April 2021 and MW033 in October 2022 and April 2023, PFAS were not detected above the LOR in these wells, refer to **Table 24**. This indicates PFAS have not migrated vertically to the Walloon Coal Measures beneath CPSA A and therefore there is no change to the risk profile.

PFAS was detected in groundwater in two monitoring wells (MW025 and MW034), located further northeast, adjacent to Bremer River, approximately 1.7 km northeast of CPSA A. Both wells are screened in the Alluvium. The concentration of sum of PFOS and PFHxS at MW025 in April 2022 and October 2022 was 1.63 µg/L and 2.44 µg/L, respectively. These new maximum concentrations (which are slighlty higher compared to the previous maximum concentration of 1.59 µg/L in October 2017), indicate concentrations have slightly increased over the monitoring period, which potentially could be natural variability within the expected laboratory variability. Concentrations of sum of PFOS and PFHxS in the April 2023 monitoring round have decreased. Analysis of results using Mann-Kendall, confirmed an increasing trend in groundwater at MW025.

Monitoring well MW035 is located approximately 1.7 km to the east of CPSA A and approximately 1.0 km south of MW025. PFAS have not been detected in any of the 11 groundwater samples collected from this well between 2017 and 2023, indicating PFAS in groundwater sourced from CPSA A does not extend as far east as MW035. Monitoring well MW035 is also the closest well down-gradient (to northeast) of CPSA U (33 Squadron Hangar). As PFAS were not detected in groundwater from MW035, this supports the finding in the DSI (CH2M Hill, 2018) that this source area has a relatively low contribution to risk.

PFAS concentrations in monitoring well MW034 were variable during the monitoring period and above the historical range. This monitoring well is screened in Alluvium and located close to discharge point 5 (DP5) along the Bremer River, where surface water may be discharging to groundwater. Dataloggers installed in wells along the Bremer River have shown mixed responses following rainfall events (refer to **Section 8.1.1**) indicating the potential for interaction between surface water and groundwater at locations close to the Bremer River. Sum of PFOS and PFHxS have been detected in post-wet season sampling (in April / May) in 2021, 2022 and 2023 suggesting the detections are related to seasonal fluctuations, refer to **Chart D9, Appendix D**. PFAS is not detected during dry season sampling events at MW034. The temporary increase in PFAS concentration at MW034 in post-wet season sampling events is noted to have followed a change in groundwater elevation after rainfall events. Following the large rainfall event in February 2022, PFAS concentrations decreased (being reported at the detection limit), potentially due to dilution effects from surface water infiltration from the Bremer River.

Due to the loss of source area and some down-gradient monitoring wells (including MW008, MW009, MW039 and MW040), the extent of PFAS in groundwater between the key Base source area (CPSA A) and MW025, MW034 and MW035, close to the Bremer River is currently uncertain. Based on the available groundwater results from down-gradient wells, no changes have occurred to the risk profile presented in the PMAP (Defence, 2020).

Table 24 CPSA A Former Topside Aviation Training Area and Current FTA Pad

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW002	PFOS+PFHxS	<0.01-<0.05	<0.01-0.02	-	-
	PFOA	<0.01-<0.05	<0.01	-	-
MW033	PFOS+PFHxS	<0.01-0.06	<0.01-0.02	No trend	69.4%
	PFOA	<0.01-<0.05	<0.01-<0.02	-	-
MW025	PFOS+PFHxS	<0.01-1.59	0.72-2.44	Increasing	99.4%
	PFOA	<0.01-0.08	0.02-0.17	-	-
MW034	PFOS+PFHxS	<0.01-0.21	<0.01-0.59	No trend	54.0%
	PFOA	<0.01	<0.01	-	-
MW035	PFOS+PFHxS	<0.01	<0.01	-	-
	PFOA	<0.01	<0.01	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.2 CPSA B Hangar 410 and Former Landfill

CPSA B Hangar 410 and former landfill is in the southern portion of the Base, refer to **Figure 2** in **Appendix A**. There are no groundwater wells located within the CPSA B boundary. Groundwater is inferred to flow towards Warrill Creek, approximately 400 m to the south/southeast, as shown on inferred groundwater contour maps (e.g. **Figure 6** in **Appendix A**)[10].

Monitoring well MW047 is located approximately 175 m down-gradient of CPSA B and reported sum of PFOS and PFHxS concentrations between 2.8 µg/L (in April 2021) and 16.7 µg/L (in October 2022) during the monitoring period, refer to **Table 25**. The October 2022 result was a new maximum concentration, slightly exceeding the previous maximum of 13.5 µg/L (from April 2020). As shown on the temporal graph for sum of PFOS and PFHxS (see **Chart D7** in **Appendix D**), MW047 has exhibited variability with concentrations increasing and decreasing with occasional order of magnitude changes. Sum of PFOS and PFHxS concentrations have fluctuated between 0.64 and 16.7 µg/L during the monitoring period. Analysis using Mann-Kendall confirmed increasing trends in PFOS, sum of PFOS and PFHxS and PFOA at this location. There does not appear to be a clear wet / dry season trend with concentration peaks reported in both seasons. Overall, the results do not indicate notable changes to PFAS concentrations down-gradient of CPSA B and therefore there are no changes to the risk profile as presented in the PMAP (Defence, 2020).

Table 25 CPSA B Hangar 410 and Former Landfill

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW047	PFOS+PFHxS	0.03 -13.5	2.64 – 16.7	Increasing	99.2%
	PFOA	<0.01-0.26	0.025-0.52	Increasing	99.9%

[10] Note that groundwater flow direction is perpendicular to the contours shown, with flow from the higher groundwater level to the lower groundwater level.

8.2.3 CPSA C Frog's Hollow Former Fire Training School

The former Fire Training School is in the southwestern portion of the Base. Groundwater in the Alluvium is inferred to flow southeast towards Warrill Creek, which is 450 m from CPSA C. Monitoring well MW037 is screened in the Alluvium aquifer between 5 and 10 mbgl. The concentration of sum of PFOS and PFHxS and PFOA in this well is stable as indicated by Mann-Kendall analysis, refer to **Table 26**. Conversely, the PFOS trend was identified to be increasing. The difference is due to relative changes in PFHxS and PFOS concentrations. The temporal graph **Chart D7** in **Appendix D** indicated concentrations have decreased since the peak in late 2017 and have since stabilised. There is no change to the nature of PFAS or the risk profile. Results for wells down-gradient of CPSA C are discussed in the following sections.

Table 26 CPSA C Frog's Hollow Former Training School

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW037	PFOS+PFHxS	4.28-6.54	3.63-6.82	Stable	69.4%
	PFOA	0.02-0.04	0.03-0.12	No trend	82.1%

8.2.4 CPSA D Sewage Treatment Plant and CPSA E Historic Containment Pond

CPSA D is located adjacent to Frog's Hollow Gully and CPSA E is located approximately 500 m to the east of CPSA D. Groundwater in this area is inferred to flow to the southeast. MW021 is located within CPSA D with MW032 located approximately 200 m down-gradient. MW048 is located approximately 500 m cross/down-gradient of CPSA D, within CPSA E. All wells are screened in the Alluvium.

Sum of PFOS and PFHxS concentrations in groundwater samples from monitoring well MW021 during the monitoring period were higher relative to 2019 to 2020 with three new maximum concentrations recorded in April 2021 (81.3 µg/L), October 2022 (88.0 µg/L) and April 2023 (142 µg/L), refer to **Table 27**. Mann-Kendall analysis indicated an increasing trend at MW021.

MW032, located further down-gradient reported relatively lower concentrations of sum of PFOS and PFHxS (34.8 µg/L in March/April 2022 and 37.4 µg/L in October/November 2022). Sum of PFOS and PFHxS concentrations in MW032 reported new maximums on three occasions, indicating some variability in the concentrations, refer to **Chart D7** in **Appendix D**. The April/May 2023 were within the historical range. Mann-Kendall analysis indicated increasing trends in this well for PFOS, sum of PFOS and PFHxS and PFOA.

PFAS in groundwater at MW048, located cross/down-gradient of CPSA D and within CPSA E reported PFAS concentrations within the historical range. Mann-Kendall results indicated decreasing concentrations at this location for PFOS, sum of PFOS and PFHxS and PFOA.

MW054S/D are located further down-gradient of CPSA D and E, beyond the Base boundary and on the southern side of Warrill Creek. An increase in sum of PFOS and PFHxS concentration occurred in MW054S in 2022 (screened in the Alluvium) with new maximum sum of PFOS and PFHxS concentrations recorded (0.24 µg/L in April 2022 and 0.38 µg/L in November 2022), relatively higher than the previous range (<0.01 to 0.14 µg/L). A consistent sum of PFOS and PFHxS concentration of 0.35 µg/L was recorded in April/May 2023. The increase is potentially due to surface water containing PFAS recharging to groundwater. This is based on the surface water sampling locations in Warrill Creek having detectable PFAS (nearby surface water sampling location SW005 reported sum of PFOS and PFHxS at 1.7 µg/L in October/November 2022) and Warrill Creek being previously identified as potentially a losing system, as reported in the DSI (CH2M Hill, 2018). Ongoing monitoring will indicate if the PFAS in groundwater is extending within the Alluvium-Tertiary Formation aquifer south of Warrill Creek. As no wells are present further south, the extent is uncertain.

MW054D is screened in the deeper Walloon Coal Measures and PFAS were not detected above the limit of reporting in groundwater samples collected during the monitoring period, indicating the groundwater impacts have not migrated vertically from the Alluvium to Walloon Coal Measures.

Although the PFAS groundwater data indicate increasing trends in groundwater down-gradient of these CPSAs, the PFAS concentrations are reported in the same order of magnitude as previous results, and the risk profile is therefore unchanged.

Table 27 CPSA D Sewage Treatment Plant and CPSA E Historic Containment Pond

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW021	PFOS+PFHxS	53.9-75.3	59.9-142	Probably Increasing	91.0%
	PFOA	1.44-1.72	2.19-4.45	Increasing	99.9%
MW032	PFOS+PFHxS	24.8-29.8	27.8-37.4	Increasing	98.8%
	PFOA	1.63-2.01	1.86-2.67	Probably Increasing	94.0%
MW048	PFOS+PFHxS	14.7-25.3	2.34-20.9	Decreasing	97.7%
	PFOA	0.29-0.76	0.04-0.26	Decreasing	99.9%
MW054S	PFOS+PFHxS	<0.01-0.14	0.07-0.38	Increasing	99.9%
	PFOA	<0.01-<0.10	<0.01-0.01	-	-
MW054D	PFOS+PFHxS	<0.01-0.07	<0.01-0.01	No trend	72.9%
	PFOA	<0.01	<0.01	-	-

8.2.5 CPSA G Former FTA and Operations Testing Area and CPSA CC Former Landfill

CPSA G and CPSA CC are located adjacent to the central southern base boundary adjacent to Warrill Creek, refer **Figure 2**, **Appendix A**. CPSA AA and FF are also located in this area. The concentration of sum of PFOS and PFHxS in groundwater samples from MW050 during the monitoring period, which is screened in the Alluvium aquifer, had two new maximum concentrations in April 2021 and April 2023 and Mann-Kendall analysis indicated an increasing trend at this location, refer to **Table 28**. The trend potentially indicates migration of PFAS in groundwater at relatively low concentrations from an up-gradient source, potentially CPSA G or CC. A nearby up-gradient monitoring well, MW022 located within CPSA CC (former landfill), recorded new minimum sum of PFOS and PFHxS concentrations in 2022 (4.2 µg/L in April and 1.6 µg/L in November) compared to the historical range (9.0 to 31.9 µg/L) indicating a decreasing trend (as supported by Mann-Kendall analysis), refer to **Chart D7** in **Appendix D**. This indicated that PFAS concentrations at CPSA G and CC (and CPSA AA and FF) are likely to be stable and the risk profile is unchanged to that presented in the PMAP (Defence, 2020).

Table 28 CPSA G Former FTA and Operations Testing Area and DPSA CC Former Landfill

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW050	PFOS+PFHxS	<0.01-0.024	0.08-0.35	Increasing	99.7%
	PFOA	<0.01	<0.01	-	-
MW022	PFOS+PFHxS	9.3-31.9	1.64-18.1	Decreasing	98.8%
	PFOA	0.23-0.35	0.03-0.56	Stable	72.8%

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.6 CPSA J Former FTA, Operations Testing Area and Bomb Replacement Apron

CPSA J is a Former FTA, Operations Testing Area and Bomb Replacement Apron located in the southeastern portion of the Base. Monitoring well MW005 is located down-gradient (east) of CPSA J and reported similar sum of PFOS and PFHxS concentrations, between 0.05 µg/L and 0.08 µg/L, in monitoring rounds between October 2021 and April 2023, refer to **Table 29**. PFOA was not detected above the limit of reporting. The reported concentrations are within the historical range for MW005, refer to **Chart D8** in **Appendix D**. Mann-Kendall analysis did not identify a trend. The results indicate there has been no change in the nature of PFAS in groundwater during the monitoring period at this location and no change to the risk profile presented in the PMAP (Defence, 2020).

Table 29 CPSA J Former FTA, Operations Testing Area and Bomb Replacement Apron

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW005	PFOS+PFHxS	<0.01-0.41	<0.01-0.08	No trend	87.5%
	PFOA	<0.01-0.02	<0.01	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.7 CPSA M Fuel Farm and CPSA N Fire Station

CPSA M and N are located adjacent to each other in the centre of the Base. MW056 previously provided groundwater monitoring data at these source areas, however, this bore was lost in 2019 and has not been replaced so no proximal groundwater data are available for CPSA M and N. Up-gradient monitoring well (MW309) is located to the west of CPSA M and N and monitors the Tertiary Formation. Sum of PFOS and PFHxS have not been detected in groundwater at this location since 2019. A cross-gradient well (MW012) is located to the south, also screened within the Tertiary Formation, and in April 2022 a new maximum sum of PFOS and PFHxS was recorded (0.17 µg/L), which increased by one order of magnitude compared to October 2021 (0.02 µg/L). The concentration decreased to 0.06 µg/L in October 2022 and April 2023, however, Mann-Kendall analysis indicates an increasing trend for PFOS and sum of PFOS and PFHxS in this well, refer to **Table 30**. This may indicate a previously unknown minor local source to the west or south of CPSA M and N.

The nearest down-gradient monitoring well (MW006), is located approximately 1 km to the east-southeast (across the runway), slightly cross-gradient to the source areas and screened within the shallow Alluvium aquifer. This well reported sum of PFOS and PFHxS within the historical range during the monitoring period, with concentrations between 52.5 and 56.7 µg/L. Monitoring wells MW023, MW028, MW029, MW056S and MW056I are further east and potentially down-gradient of MW006 and the CPSAs.

Historical PFAS concentrations in MW028 (sum of PFOS and PFHxS in the range 30.7 to 83 µg/L) have been similar to concentrations in MW006, however, since October 2022 relatively lower concentrations were reported (between 4.9 and 26.4 µg/L).

Lower concentrations were recorded in groundwater samples from MW023 during the monitoring period (0.4 to 1.2 µg/L PFOS and PFHxS), with these results within the historical range for this well. New maximum sum of PFOS and PFHxS concentrations were recorded at MW029 in 2022 (11.2 to 11.8 µg/L PFOS and PFHxS), which is a slight increase compared to the historical range (4.3 to 9.9 µg/L) and Mann-Kendall analysis confirmed an increasing trend at this location.

The collection of groundwater samples from MW056S and MW056I was variable during the monitoring period due to the presence of dense vegetation preventing access on occasion. The wells are located off-Base, approximately 750 m to the east of MW028 and MW029 and have occasionally detected PFAS at concentrations close to detection limits. Statistical analysis did not identify a trend in MW056S, while MW056I had a probably increasing trend for sum of PFHxS and PFOS. The occasional detections are considered to be natural variability within the expected laboratory varaibility and may indicate surface water and groundwater interaction following the intense rainfall events in 2022.

Based on the above results, the most likely PFAS source for groundwater at MW006, MW023, MW028 and MW029 is considered to be CPSAs M and N. Other CPSA including CPSA BB, L and O are also potential source areas contributing to PFAS concentrations, however, they have not been identified as having a high, moderate or low relative contribution to risk, refer to **Section 2.3**. **Chart D8** in **Appendix D** indicates concentrations in the down-gradient wells have been broadly stable (of a similar magnitude) since 2017. Based on these results, the extent of PFAS and risk profile associated with these CPSAs is unchanged from the PMAP (Defence, 2020).

Table 30 CPSA M Fuel Farm and CPSA N Fire Station

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW309	PFOS+PFHxS	<0.01-1.4	<0.01-<0.05	-	-
	PFOA	<0.01-0.04	<0.01-<0.05	-	-
MW012	PFOS+PFHxS	<0.01-<0.05	0.01-0.17	Increasing	99.7%
	PFOA	<0.01-<0.05	<0.01-<0.02	-	-
MW006	PFOS+PFHxS	56.3-187	52.2-56.7	Decreasing	99.9%
	PFOA	0.75-2.46	0.99-1.07	Stable	56.0%
MW023	PFOS+PFHxS	<0.01-0.38	0.23-1.15	No trend	69.4%
	PFOA	<0.01-0.02	<0.01	Stable	58.0%
MW028	PFOS+PFHxS	30.7-83.0	4.87-66.5	Stable	82.1%
	PFOA	0.87-2.10	0.13-1.98	Stable	82.1%
MW029	PFOS+PFHxS	5.79-8.91	8.27-11.8	Increasing	99.7%
	PFOA	0.14-0.27	0.20-0.32	Increasing	99.8%
MW056S	PFOS+PFHxS	<0.01-0.02	<0.01-0.01	No trend	58.0%
	PFOA	<0.01-<0.02	<0.01	-	-
MW056I	PFOS+PFHxS	<0.01-0.02	<0.01-0.03	Probably Increasing	94.6%
	PFOA	<0.01	<0.01	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.8 CPSA V AFFF Wastewater Holding Tank

The highest PFAS concentration detected in groundwater at the Base during the monitoring period was recorded at MW046 (121 to 420 µg/L sum of PFOS and PFHxS), located adjacent to, and down-gradient of CPSA V, the AFFF wastewater holding tank, refer to **Table 31**. The concentrations reported during the monitoring period was within the historical range for MW046. This monitoring well also recorded the highest PFAS concentration at the Base in 2020. Mann Kendall analysis indicates a decreasing trend in sum of PFOS and PFHxS (as well as PFOS and PFOA) and a new minimum was recorded in April 2023, refer to **Chart D5** in **Appendix D**. The reduction may reflect attenuation and dispersion of PFAS.

Groundwater beneath CPSA V flows to the northeast towards the Bremer River. Sum of PFOS and PFHxS in groundwater directly east of MW046 on the eastern side of the runway, at MW007, was reported between 6.0 and 53.4 µg/L during the monitoring period. Relatively lower concentrations were recorded during 2022 monitoring events (including a new minimum in April 2022), refer to **Chart D9**, **Appendix D**. The decrease may be due to dilution of the aquifer from surface water infiltration and recharge following the high rainfall events during 2022. As the results during the monitoring period are broadly consistent with historical results, the extent of PFAS and risk profile associated with CPSA V is unchanged from the PMAP (Defence, 2020).

Table 31 CPSA V AFFF Wastewater Holding Tank

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW046	PFOS+PFHxS	381-520	121-420	Decreasing	98.4%
	PFOA	32.4-36.0	7.75-40.3	Probably Decreasing	91.1%
MW007	PFOS+PFHxS	47.7-109	5.95-53.4	Decreasing	99.7%
	PFOA	1.23-2.0	0.11-1.35	Probably Decreasing	94.0%

8.2.9 CPSA W Fire Fighting Training School

PFAS concentrations in groundwater samples from monitoring wells installed within the Walloon Coal Measures at CPSA W, have generally been reported close to, or less than, the limit of reporting except in samples from MW030 located on the northern boundary of CPSA W. Increasing trends were identified at MW030 for sum of PFOS and PFHxS, PFOS and PFOA.

Sum of PFOS and PFHxS concentrations have steadily increased from a 0.32 µg/L in February 2017 to 12.9 µg/L in May 2023, with each event since April 2020 recording a new maximum concentration, refer to **Chart D6** in **Appendix D** and **Table 32**. The samples from MW030 are dominated by PFHxS (98%). PFOA has increased from a non-detect in 2017 to 1.37 µg/L in May 2023. Due to the limited number of wells and variability in groundwater elevation recorded in the Walloon Coal Measures in this portion of the Management Area, the localised groundwater flow directions are uncertain. As there is potential for localised flow to the west, the spatial distribution of PFAS at this location is uncertain.

Two other monitoring wells are located within this source area, MW042, located to the south along the western boundary of the source area, and MW043 located further south of MW042. An increasing trend was identified for sum of PFOS and PFHxS and PFOS in MW043 with a new maximum sum of PFOS and PFHxS concentration reported in April 2023 (0.70 µg/L). Conversely, a decreasing trend was identified at MW042 with concentrations of sum of PFOS and PFHxS during the reporting period between 0.01 and 0.07 µg/L. The results indicate MW043 may be close to a localised source.

PFAS concentrations in the monitoring well cross-gradient to the north (MW033), reported sum of PFOS and PFHxS concentrations that did not exceed, or were close to, the limit of reporting (up to 0.02 µg/L) during the monitoring period. No trend was identified for MW033. This indicates the increase in PFAS concentrations at MW030 has not impacted the location of MW033.

Overall, the results indicate the PFAS source at CPSA W is locally affecting groundwater quality in the Walloon Coal Measures aquifer with impacts extending to the north (at MW030) and the south (at MW043). The potential for groundwater flow, and PFAS migration, down-gradient to the west/northwest is uncertain as there are no wells in this direction and a down-gradient monitoring well would be required to address this data gap. Ongoing monitoring will provide information about the nature of PFAS to the north and southwest at CPSA W.

Table 32 CPSA W Fire Fighting Training School

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW030	PFOS+PFHxS	0.32-2.91	2.96-12.9	Increasing	>99.9%
	PFOA	<0.01-1.37	0.2-0.32	Increasing	99.8%
MW033	PFOS+PFHxS	<0.01-0.06	<0.01-0.02	No trend	69.4%
	PFOA	<0.01-<0.05	<0.01-<0.02	-	-

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW042	PFOS+PFHxS	<0.01-424	<0.01-0.07	Decreasing	96.4%
	PFOA	<0.01-38.0	<0.01	Decreasing	95.5%
MW043	PFOS+PFHxS	<0.01-0.15	0.01-0.70	Increasing	98.2%
	PFOA	<0.01-<0.10	<0.01-0.02	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.10 CPSA X Former Structural and Open Pit FTA

CPSA X is the Former Structural and Open Pit FTA located along the central portion of the western boundary. MW041 is located in the vicinity of CPSA X and east of CPSA W. Groundwater from this well recorded a new maximum concentration of 0.44 µg/L sum of PFOS and PFHxS in April 2022, refer to **Table 33**. The previous maximum was 0.08 µg/L. The concentration subsequently decreased and did not exceed the limit of reporting in April 2023. Mann-Kendall analysis indicated no trend in this well. The relatively low concentration of the key contaminants, PFHxS, PFOS and PFOA compared to other source areas indicated that this area is not a large source of PFAS to groundwater. Sum of PFOS and PFHxS has been detected four times in MW041 since 2018, refer to **Chart D6** in **Appendix D**. As the results are broadly consistent with historical results, there is no change to the nature and extent of PFAS in groundwater over the monitoring period and the risk profile remains unchanged from that presented in the PMAP (Defence, 2020).

Table 33 CPSA X Former Structural and Open Pit FTA

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW041	PFOS+PFHxS	<0.05-0.08	<0.01-0.44	No trend	69.4%
	PFOA	<0.01-<0.1	<0.01-<0.02	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.11 CPSA Z Fuel UST with AFFF listing

CPSA Z is located in the central southern portion of the Base. Monitoring well MW020 is located down-gradient of this source area and screened within the Tertiary Formation, refer to **Figure 4**, **Appendix A**. PFAS concentrations have consistently been detected at this location since monitoring commenced in 2017. MW020 results have exhibited variability, by an order of magnitude, which is attributed to seasonal effects, refer to **Chart D8** in **Appendix D**. New maximum concentrations for sum of PFOS and PFHxS were reported in April 2021, April 2022 and April 2023 (40.9 to 134 µg/L), however, much lower concentrations were recorded during October sampling events in 2021 and 2022 (12.8 and 3.25 µg/L, respectively), refer to **Table 34**. Due to the variability, Mann-Kendall analysis did not identify a trend in this well. The reason for the seasonal change in concentration is not known but is likely to be due to increased leaching during the wet season of a secondary soil source area. The groundwater table elevation is stable with less than 1 centimetre (cm) difference between three gauging events between April 2021 and April 2022.

As groundwater flow is inferred to be to the southeast at this location, the only down-gradient monitoring wells (MW005, MW057S and MW057I) are located 1.5 to 2.0 km away. PFAS concentrations in groundwater from these distal monitoring wells have been typically reported close to the limit of reporting. During the monitoring period, concentrations in MW005 and MW057I were consistent with the historical results. Sum of PFOS and PFHxS at MW057S reported a new maximum of 2.6 µg/L in October/November 2022, which decreased to 1.3 µg/L in April/May 2023, however, no trend was identified in this well by Mann-Kendall analysis.

The concentration detected in MW057S in October/November 2022 represented a new exceedance of the recreational water use guideline value (HEPA, 2020). MW057S is located immediately adjacent to Warrill Creek. Although the wells do not have a logger installed it is likely that MW057S is hydraulically connected to Warrill Creek. There are no nearby surface water sampling locations to MW057S, with the nearest upstream (SW020) and downstream (SW100) locations recording much lower sum of PFOS and PFHxS concentrations (up to 0.11 µg/L) compared to the concentrations recorded at MW057S. There is a discharge point upstream of MW057S (DP13), however, there are no surface water data available for this location.

The increase in PFAS concentration at MW057S, is potentially related to migration of PFAS from up-gradient sources or could potentially relate to discharge from on-Base drains from DP13, or alternatively, the increase may be temporary and reflect mobilisation of PFAS during flooding following the large rainfall event in February 2022. The increase in concentrations may indicate the extent of PFAS in groundwater has migrated laterally further east beyond Warrill Creek, however, as there are no wells further east, the extent is uncertain. Mann Kendall analysis did not identify a trend.

PFAS concentrations at MW057I (which is screened in the deeper Tertiary Formation) were reported to be at, or less than, the limit of reporting during the monitoring period, which is consistent with historical results indicating limited vertical migration in the connected aquifer.

Ongoing monitoring will provide information about the nature of PFAS at these locations. The risk profile remains unchanged for CPSA Z.

Table 34 CPSA Z Fuel UST with AFFF Listing

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW020	PFOS+PFHxS	6.82-22.7	3.25-134	No trend	69.4%
	PFOA	0.52-1.33	0.06-2.60	No trend	76.2%
Down-gradient locations					
MW005	PFOS+PFHxS	<0.01-0.41	0.05-0.08	No trend	87.5%
	PFOA	<0.01-0.02	<0.01	-	-
MW057S	PFOS+PFHxS	0.06-0.2	0.05-2.57	No trend	59.0%
	PFOA	<0.01	<0.01-0.11	Increasing	99.4%
MW057I	PFOS+PFHxS	<0.01-0.01	<0.01-0.01	Stable	45.1%
	PFOA	<0.01	<0.01	-	-

Notes: - Data could not be analysed due to results not exceeding the LOR or not meeting the criteria for analysis.

8.2.12 CPSA DD HS748 Former FTA on Disused Runway

Monitoring well MW049 is located along the central southern base boundary within CPSA DD. Sum of PFOS and PFHxS in April 2022 reported a new minimum concentration with 4.8 µg/L with another relatively low concentration of 15.9 µg/L in October 2022. The well was unable to be located for the April 2023 monitoring round. The historical range between 2018 and 2021 was 20.1 to 46.7 µg/L, refer to **Chart D7** in **Appendix D** and **Table 35**. PFAS results for the monitoring period were variable. PFAS concentrations in groundwater from a down-gradient monitoring well (MW022) reported new minimum concentrations in both March/April (4.2 µg/L) and October/November 2022 (1.6 µg/L), although the April 2023 concentration was within the historical range (9.0 µg/L). As the results during the monitoring period were within the same order of magnitude, there has been no change in the nature of PFAS in groundwater during the monitoring period at CPSA DD and no change to the risk profile presented in the PMAP (Defence, 2020).

Table 35 CPSA DD HS748 Former FTA on Disused Runway

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann-Kendall Trend	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW049	PFOS+PFHxS	20.1-46.7	4.83-25.9	Decreasing	99.8%
	PFOA	0.60-1.95	0.4-1.07	Decreasing	96.9%

8.2.13 Summary

The temporal evaluation indicates stable or variable PFAS concentrations in groundwater in most on- and off-Base monitoring wells. 20 of the 40 monitoring wells during the monitoring period recorded new maximum sum of PFOS and PFHxS. A notable difference in the 2022 results was the magnitude and range of concentration increases indicating increased variability. Five wells in 2022 reported maximum sum of PFOS and PFHxS concentrations that were more than double the historical maximum concentration. As a comparison, in 2021, none of the concentrations doubled. These five wells included:

- two wells located in the western portion of the Base and screened in the Walloon Coal Measures (MW030 [11.6 µg/L in October/November 2022] and MW041 [0.44 µg/L in April 2022] close to CPSA W and X, respectively).
- two wells located off-Base, screened in Alluvium close to the Warrill Creek (MW054S [0.38 µg/L in October] and MW057S [2.57 µg/L in October/November 2022] down-gradient of CPSA D and E in the southern portion of the Base)
- one well located in the central southern portion of the Base (MW020 [85.9 µg/L in April 2022 and 134 µg/L in April 2023]) close to CPSA Z.

As the sum of PFOS and PFHxS concentration in groundwater from three wells (MW041, MW054S and MW057S) decreased in October/November 2022 and April/May 2023, this indicates variability in these wells. The temporary increases may be influenced by the higher-than-average rainfall in 2022, which may have mobilised PFAS contamination via infiltration or surface water transport along the drainage network and creeks.

PFAS concentrations at MW020 show seasonal changes with post-wet season concentrations increasing, approximately doubling each year since 2020, which suggests increased PFAS mobilisation during the wet season. Due to the presence of the runway, there are no down-gradient wells for 1.5 km and the localised extent of impact is uncertain.

Based on groundwater level data collected during the monitoring period, groundwater in wells located close to creeks has been demonstrated to be in hydraulic connection with surface water which may transport PFAS in surface water to groundwater. As PFAS concentrations in 2022 temporarily increased at MW054S and MW057S, this may indicate migration of PFAS in groundwater laterally to the south and east of Warrill Creek.

The exceedance of the recreational water use guideline value for sum of PFHxS and PFOS in MW057S in October 2022 is considered to be of low significance as the exceedance was temporary and the concentration was below the guideline in the next sampling event in April 2023. In addition, groundwater is unlikely to be used for recreational uses at the location of MW057S.

The extent of PFAS in groundwater down-gradient of monitoring wells MW030, MW054S and MW057S is uncertain as there are no off-Base monitoring wells further west of MW030 or further south and east of MW054S and MW057S, respectively.

Decreasing trends in PFOS and PFHxS groundwater concentrations were identified in seven on-Base wells (MW006, MW007, MW022, MW042, MW046, MW048 and MW049) and no excavation or remediation activities are known to have occurred in these areas. The risk profile across the Management Area remains unchanged to that presented in the PMAP (Defence, 2020).

A review of the risk profile is presented in **Section 9.2**.

8.3 Surface Water and Sediment Results

The surface water drainage consists of 11 main catchments with 24 discharge points located along the Bremer River and Warrill Creek, refer to **Figure 3** and **Figure 5**, **Appendix A**. The table below summarises the CPSAs and discharge points for the different catchments and the sampling locations, at or downstream of the discharge points.

Table 36 Catchment areas and discharge points for CPSA

Catchment Area (refer Figure 3, Appendix A)	Receiving Watercourse	CPSA in Catchment	Discharge Points (DP)	Sampling locations
1	Bremer River	W, A	1-4	SW039, SW052, SW088-SW091
2	Warrill Creek	DD, F	18-20	SW005
3	Bremer River	N, J, M, BB	8-9	SW041
4	Warrill Creek	DD	21	SW005
5	Warrill Creek	B, E	22	SW004
6	Warrill Creek	B, E	23	SW004
7	Warrill Creek	C, D	24	SW008, SW009
8	Bremer River	A, X, Y, S, V	5	SW036, SW047, SW094
9	Bremer River	U, Q	6	SW050
10	Warrill Creek	J, CC, FF	14-17	SW015, SW016, SW018, SW034, SW020
11	Bremer River	-	7	SW051

8.3.1 Bremer River

The Bremer River forms the northern and eastern boundary for the Base. During the monitoring period, PFAS were close to[11] or below the limit of reporting in surface water from sampling locations in catchment 1 downstream of DP1 to DP4 and upstream of DP5 (SW039, WS052, SW088-SW091), refer to **Figure 5** in **Appendix A**.

Downstream of DP5, PFAS has historically been detected at concentrations exceeding the ecological assessment criteria indicating discharge of water from source areas within Catchment 8 as outlined in **Table 36**, above. Historically, PFAS concentrations have decreased with increasing distance downstream from DP5. PFAS were detected at SW047 (located close to DP5) in five sampling events between June 2017 and October 2020, recording between 0.39 and 5.47 µg/L sum of PFOS and PFHxS, however, PFAS were not detected above the limit of reporting during the 2021-2023 monitoring period, refer to **Chart D10** in **Appendix D**. At SW094, which is further downstream, sum of PFOS and PFHxS exceeded the recreational water guideline value for the first-time in April 2022 (2.27 µg/L), however, this appears to be a temporary spike as PFAS were not detected in October 2022 with sum of PFOS and PFHxS at 0.21 µg/L in May 2023. In addition, groundwater is unlikely to be used for recreational use at the location of SW094, and overall, the risk profile is unchanged. The analytical results indicates variability in PFAS concentrations. Further downstream of DP5 (at SW036 and

[11] During the monitoring period, the only detection was 0.03 µg/L sum of PFOS and PFHxS at SW052 in April 2023.

SW050), PFAS concentrations were within the historical range. Overall, the results do not indicate PFAS concentrations are increasing downstream of DP5.

The exceedance of the recreational water use guideline value for sum of PFHxS and PFOS in SW094 in April 2022 is considered to be of low significance as the exceedance was temporary with non-exceedance in the next sampling event in April 2023.

SW051 and SW098 are located downstream of DP6 and DP7. During the monitoring period, PFAS concentrations were lower than the historical maximums at these two locations. New minimum concentrations were recorded in April 2022.

Sampling location SW041 is located along a drain that discharges to Bremer River (DP9) and has historically reported sum of PFOS and PFHxS in the range 4.5 to 48.2 µg/L indicating PFAS is migrating in surface water along this drain, which includes major and moderate CPSAs including M, N and J. A new minimum sum of PFOS and PFHxS (1.78 µg/L) was recorded during the October/November 2022 sampling event. This may indicate dilution due to the large rainfall events during 2022. PFAS concentrations in April 2023 were within the historical range.

Surface water samples from two downstream sampling locations (SW040 and SW045), beyond the confluence of Warrill Creek with Bremer River, were reported within the historical range during the monitoring period.

In summary, sum of PFOS and PFHxS concentrations along the Bremer River have been variable with no correlations identified between individual locations. The variability may relate to the intermittent nature of flow along Bremer River and is affected by seasonal changes due to increased rainfall during the wet season, in particular in February 2022, following which, relatively lower PFAS concentrations were detected. The surface water concentrations in the Bremer River during the monitoring period are generally consistent with historical concentrations and do not indicate increasing PFAS concentrations. Therefore, the data do not indicate changes to the nature and extent of PFAS and the risk profile remains unchanged.

8.3.2 Warrill Creek

Warrill Creek forms the southern and southeastern boundary for the Base. PFAS were not detected in the samples collected along Warrill Creek, upstream of the Base (SW043) indicating there are no upstream PFAS sources in the Warrill Creek catchment.

Sampling locations SW028 and SW008 are located along Frog's Hollow Gully which discharges into Warrill Creek at approximately the location where Warrill Creek forms the southern Base boundary. Frog's Hollow Gully receives surface water from CPSA C (fire training school) and CPSA D (sewage treatment plant). Surface water from both locations reported new minimum sum of PFOS and PFHxS concentrations in 2022, which may reflect dilution effects following high rainfall and localised flooding along Frog's Hollow Gully in 2022.

Sampling locations SW009 and SW004 are located downstream of the confluence of Frog's Hollow Gully with SW004 also downstream of DP22 which receives surface water from Catchment 5. Both SW009 and SW004 recorded new maximum sum of PFOS and PFHxS concentrations in 2022 of 1.8 µg/L (SW009) and 0.14 µg/L (SW004), which suggest increased mobilisation of PFAS in surface water due to discharge. These were temporary spikes with concentrations decreasing to the historical range in subsequent sampling events. Sampling location SW005 is downstream of DP20 and DP21 and recorded a maximum sum of PFOS and PFHxS concentration of 17.6 µg/L in April 2023, which is four times higher than the historical maximum indicating an upstream source of PFAS, possibly from CPSA DD or F, which are located within the catchment (catchment 2 as shown in **Figure 3**, **Appendix A**).

Sampling locations SW015, SW016, SW018, SW020 and SW034 are located along a stretch of Warrill Creek where DP14 to DP17 are located, which discharge in catchment 10. Reported concentrations in surface water from these sampling locations were similar during the monitoring period (sum of PFOS and PFHxS were between <0.01 and 0.50 µg/L) and generally within the historical ranges[12].

[12] Elevated PFAS concentrations (12 µg/L sum of PFOS and PFHxS) was detected in SW034 in June 2017 but all concentrations since this date have been one to two orders of magnitude below this concentration.

Sampling locations SW099, SW100 and SW026 are located upstream to the confluence of Warrill Creek with the Bremer River and downstream of the confluence with the Purga Creek. Sum of PFOS and PFHxS concentrations in these sampling locations were in similar range (<0.02 to 0.58 µg/L) during the monitoring period. New maximums were recorded in all three wells, in October 2022 at SW026 (0.58 µg/L) and SW099 (0.12 µg/L) and at SW100 in April 2023 (0.28 µg/L). The subsequent sampling events at SW026 and SW099 reported relatively lower PFAS concentrations indicating variability in the dataset.

There were no first-time detections of sum of PFOS and PFHxS during the monitoring period with one first-time detection of PFOA at SW026 in October 2022 (0.02 µg/L). **Chart D11** in **Appendix D** shows sum of PFOS and PFHxS concentrations in Warrill Creek are variable with periods of increasing and decreasing concentrations across the catchment. The charts show that most surface water samples along Warrill Creek correlate with each other with concentrations increasing or decreasing at the same time and showing the same degree of variability, with the exception of SW026 and SW005 that show relatively higher variability. This suggests the migration of PFAS along Warrill Creek may be related to temporal effects and surface water flow rates. SW026 is close to the confluence with the Bremer River, which potentially affects PFAS concentrations depending on the predominant flow and possibly localised flooding in this area. Based on the results collected during the monitoring period, the nature and extent of PFAS concentrations in Warrill Creek and the associated risk profile remain unchanged from the PMAP (Defence, 2020).

8.3.3 On-Base catchment areas

PFAS has been detected in all surface water samples collected within drainage channels across the Base, which are downstream of identified CPSAs. The distribution of PFAS in surface water during the monitoring period is generally similar to historical results (CH2M Hill, 2018 and 2020b) except for SW033 and SW027.

SW033 is in the northeastern corner of CPSW W at the rear of a plastic lined holding dam. Concentrations of sum of PFOS and PFHxS increased by an order of magnitude in 2021 (108 and 101 µg/L in March/April and October/November 2021, respectively), with relatively lower concentrations recorded in 2022 (22.4 and 60 µg/L in April and October 2022, respectively). Refer to **Chart D12**, **Appendix D**. SW033 is located within a known PFAS contamination hotspot within an identified PFAS source area. No clear seasonal variations are apparent.

Sampling location SW027 is located close to CPSA Q. Sum of PFOS and PFHxS concentrations in 2022 were variable with both new maximum and minimum concentrations recorded. In March/April 2022, a new maximum concentration was recorded (35.5 µg/L), which was an order of magnitude increase compared to historical results. In October/November 2022, a new minimum concentration was recorded (0.24 µg/L). CPSA Q has a large proportion of hard surfaces and therefore drains in this area readily respond to rainfall. There is a limited dataset (four rounds of data) for this location due to the short-lived nature of surface water flows and small catchment area for this drain. As SW027 is located at the top section of the drain, there is limited flow into this section and the surface water is not likely to be diluted by inflows from other parts of the catchments.

PFAS concentrations in surface water samples from the other on-Base drains during the monitoring period were within the historical range. The range in sum of PFOS and PFHxS concentrations for 2022 (<0.01 to 60 µg/L) and April/May 2023 (<0.02 to 45.9 µg/L) were similar to the 2017 to 2020 range (<0.01 to 63.4 µg/L), refer to **Chart D12**, **Appendix D**.

There were no new exceedances or first-time detections of sum of PFOS and PFHxS and PFOA in drain samples during the sampling events (other than the detections/exceedances in a sample (SW304) that was collected from DP14 for the first-time in April 2023). Based on these results, the risk profile remains unchanged.

8.3.4 Off-Base upstream catchment areas

SW025 is a sampling point indicative of background conditions upstream of the Base along Bremer River. Since 2019, when a possible false positive was reported at the detection limit, PFAS have not been detected at this sampling location indicating there are no upstream off-Base sources of PFAS impacting Bremer River.

8.3.5 Sediment

The highest sum of PFOS and PFHxS concentrations recorded in samples collected from the on-Base drains during the monitoring period were from SD079 (1.94 mg/kg) and SD056 (1.93 mg/kg), which are located downstream of known source areas on-Base, CPSA M / N and CPSA U, respectively, refer to **Figure 2**, **Appendix A**). Both concentrations were new maximum concentrations for the sample locations. Sum of PFOS and PFHxS were detected in all drain samples with 14 of the 22 samples reporting new maximum concentrations during the monitoring period. PFOA was detected in most sediment samples and new maximum concentrations were reported in seven sampling locations. The increase in PFAS concentrations at multiple drain locations may be associated with the higher rainfall totals during 2022, which may have increased the transportation of impacted sediment from source areas.

The sediment sample from SD059, located downstream of CPSA A showed variability with sum of PFOS and PFHxS at <0.0002 mg/kg in March/April 2022, with the sample collected in October/November 2022 reporting a new maximum of 1.10 mg/kg.

Sediment quality data for on-Base drains was reported in the Defence database during a sampling event conducted as part of the PMAP Delivery project in August 2021. Analytical results for sediment samples collected from drains close to the discharge points to Warrill Creek (DP18-24, refer to **Figure 5**, **Appendix A**) indicated sample SD525, from DP18, adjacent to CPSA DD had 3.15 mg/kg sum of PFHxS and PFOS. This is one of the highest concentrations recorded for sediment samples in the dataset. Sum of PFHxS and PFOS concentrations in the other samples were in the range 0.009 to 0.26 mg/kg. This indicates PFAS is migrating in sediment along the discharge points to Warrill Creek. This could be due to the transport of sediment along the drains or, alternatively, due to high PFAS concentrations in surface water sorbing onto sediment. As discussed in **Section 6.1**, ongoing PMAP Delivery activities include a mass flux study to understand transport pathways.

PFAS were detected in all downstream sampling locations along Bremer River and Warrill Creek in 2022 with 10 of the 27 sediment sampling locations (SD004, SD009, SD020, SD036, SD039, SD045, SD051, SD052, SD090, SD091) recording new maximum concentrations of either sum of PFOS and PFHxS or PFOA. The magnitude of the increases in concentration was relatively minor (i.e., increase of sum of PFOS and PFHxS from 0.04 to 0.06 mg/kg).

The maximum sum of PFOS and PFHxS concentrations in sediment from Bremer River was at SD051 (0.0397 mg/kg) adjacent to the central eastern portion of the Base, downstream of DP6, which is itself downstream of the discharge of several major source areas including CPSA A. The maximum sum of PFOS and PFHxS sediment concentration reported along Warrill Creek during the monitoring period, was at SD005 (0.353 mg/kg) located adjacent to the southern boundary, downstream of Frog's Hollow Gully and CPSA D (sewage treatment plant) at DP24.

PFOA was rarely detected above the LOR in sediment from along the creeks, with a maximum concentration of 0.0008 mg/kg detected at SD016.

Sum of PFHxS and PFOS were detected in the upstream sampling locations SD025 (Bremer River) in April 2023 for the first-time, however, the concentration was only slightly above the detection limit and may be a false positive. PFAS were not detected in sediment at sampling location SD043 (Warrill Creek), which is consistent with historical results.

9.0 Discussion

9.1 Conceptual Site Model

The CSM was developed during the DSI (CH2M Hill, 2018) and summarises the linkages between sources, exposure pathways and receptors.

The OMP has provided additional data to further understand the changing conditions and extent of PFAS in groundwater, surface water and sediment at the Base. Key observations include:

- Mann-Kendall trend analysis of groundwater monitoring data from different locations indicated variable trends, including stable, decreasing or increasing trends. New maximum concentrations and new detections were reported at selected locations and the changes are inferred to be potentially associated with increased rainfall during the monitoring period. In particular, variability in PFAS groundwater concentrations were observed along the central western boundary at the fire training school (MW030), at CPSA Z (Fuel UST with AFFF listing) (MW020) and in wells adjacent to the Warrill Creek (MW054S and MW057S), where new maximum concentrations were recorded during the monitoring period.
- New maximum PFAS concentrations in sediment at some of the sampling locations along the drains, with new maximum concentrations recorded in approximately two-thirds of sampling locations. This is possibly related to higher-than usual surface water flows, due to the high rainfall conditions in 2022, mobilising sediment from known source areas along drainage lines, creeks and rivers.
- Despite new maximums and new detections, the inferred PFAS transport mechanisms and the groundwater, surface water and sediment concentrations are generally similar to those reported in CH2M Hill (2018) and AECOM (2021a).
- Other groundwater and surface water / sediment sampling locations along Bremer River, Warrill Creek and drains have shown generally stable concentrations during the monitoring period. The PFAS transport mechanism and the general extent are similar to that reported in the DSI, (CH2M Hill, 2018) and 2020 AIR (AECOM, 2021a). Although some monitoring wells have been lost close to some source areas in the central portion of the Base, PFAS concentrations in groundwater in down-gradient monitoring wells and surface water in Bremer River and Warrill Creek have generally indicated steady concentrations.

During the monitoring period, no PFAS remediation or management activities have taken place. Following a review of the CSM, interpretation of the data collected during the monitoring period does not affect the understanding of the CSM and no changes to the PFAS primary and secondary sources, pathways and receptors have been identified. Future monitoring will continue to contribute to an evaluation of potential changes to the CSM understanding.

9.2 Risk Profile

The potentially elevated risks identified in the PMAP (Defence, 2020) are listed in **Table 37**. Based on the data collected during OMP monitoring between March 2021 and May 2023, the risk profile to human health receptors within the Management Area remains unchanged since the publication of the HHRA (EnRisks, 2019).

Table 37 Potentially elevated risks identified in the PMAP (Defence, 2020)

ID	Risk	Description in the PMAP	Nature of risk	Relevant Risk Group	Risk Timescale
1	Incidental direct contact with PFAS in soil and sediment	Soils within CPSA A and N contain elevated concentrations of PFAS which presents a risk to Base personnel and contractors who are involved in regular soil disturbance activities.	Human health	Risk Group 1 – CPSA A and N, located within the RAAF Base Amberley Management Area	Current
2	Human consumption of fish caught from local waterways	PFAS has historically been detected in fish and crustaceans collected from Warrill Creek and Bremer River. Current Queensland Health advice is not to consume fish caught in the Investigation Area due to presence of PFAS.	Human health	Risk Group 3 – Warrill Creek Risk Group 5 – Bremer River	Current. Queensland Government has precautionary advice in place
3	Consumption of eggs by children	PFAS has been detected in soils on private properties and in water that has historically been used for irrigation. This exposure risk applies to properties where chickens have regular access to PFAS in soil or where water containing PFAS is used for irrigation.	Human health	Risk Group 4 – Properties adjacent to Warrill Creek	Current
4	Consumption of home-slaughtered beef meat	PFAS has been detected in soils on private properties and in water that has historically been used for irrigation. This exposure risk applies to properties where cattle have regular access to PFAS in soil / sediment / pasture, or where water containing PFAS is used for irrigation.	Human health	Risk Group 4 – Properties adjacent to Warrill Creek	Current
5	Consumption of home-slaughtered beef offal (liver and / or kidney)	PFAS has been detected in soils on private properties and in water that has historically been used for irrigation. This exposure risk applies to properties where cattle have regular access to PFAS in soil / sediment / pasture, or where water containing PFAS is used for irrigation.	Human health	Risk Group 4 – Properties adjacent to Warrill Creek	Current
6	Multiple exposure pathways	Multiple exposure pathways that relate to the cumulative risks associated with the consumption of fish, eggs and beef products as identified in Risk ID 3 - 6 above and the incidental direct contact with water and swimming in the Bremer River and Warrill Creek.	Human health	Risk Group 3 – Warrill Creek Risk Group 4 – Properties adjacent to Warrill Creek Risk Group 5 – Bremer River Risk Group 6 – Properties adjacent to Bremer River	Current
7	Direct toxicity to terrestrial ecosystems	Concentrations of PFOS in soils, sediments and some grass samples on-Base exceeded investigation criteria for ecological direct exposure	Ecological risk	Risk Group 2 – CPSA A, C, G, W, X, DD, located within	Current

ID	Risk	Description in the PMAP	Nature of risk	Relevant Risk Group	Risk Timescale
		(HEPA, 2018). As such, adverse effects on ecological receptors cannot be excluded.		RAAF Base Amberley Management Area	
8	Bioaccumulation and effects on higher order consumers within terrestrial ecosystems	Concentrations of PFOS in soils, sediments and some grass samples on- and off-Base exceeded investigation criteria for ecological direct exposure (95% species protection) (HEPA, 2020). As such, adverse effects on ecological receptors cannot be excluded.	Ecological risk	Risk Group 2 – CPSA A, C, G, W, X, DD, located within RAAF Base Amberley Management Area	Current
9	Direct toxicity to aquatic ecosystems	Concentrations of PFOS in surface water exceeded investigation criteria for ecological direct exposure (HEPA, 2020) during the monitoring period. As such, adverse effects on ecological receptors cannot be excluded.	Ecological risk	Risk Group 3 – Warrill Creek Risk Group 5 – Bremer River	Current
10	Bioaccumulation and effects on higher order consumers within aquatic ecosystems	Concentrations of PFOS in surface water exceeded investigation criteria for ecological direct exposure (HEPA, 2020) during the monitoring period. As such, adverse effects on ecological receptors cannot be excluded.	Ecological risk	Risk Group 3 – Warrill Creek Risk Group 5 – Bremer River	Current

The following aspects were considered in assessment of the risk profile:

Groundwater

The extent of PFAS in groundwater is generally similar to the historical dataset. The dataset indicates broadly steady or variable PFAS concentrations at, or down-gradient, of most source areas. New maximum PFAS concentration in groundwater were detected at three boundary locations during the monitoring period as follows:

- Monitoring well MW030, screened in the Walloon Coal Measures, located along the western Base boundary close to CPSA W (Fire Fighting Training School). The sum of PFOS and PFHxS concentration at MW030 increased from 3.4 µg/L in 2021 to 12.9 µg/L in April 2023. The groundwater flow direction in the Walloon Coal Measures in this portion of the Management Area is uncertain as there are no monitoring wells further west. The potential for migration of PFAS in groundwater towards the west/northwest is uncertain. Although these are identified as data gaps, revision of the OMP will consider additional monitoring required to address the data gaps.
- Monitoring well MW057S, screened in the Alluvium, adjacent to Warrill Creek. The sum of PFOS and PFHxS concentration at MW057S was 2.6 µg/L in October/November 2022 (exceedance of recreational water guideline value) compared to the previous maximum concentration of 0.1 µg/L in 2021. The increase was temporary, as a lower concentration 1.3 µg/L was reported in the sample collected in April 2023 and was below the recreational water guideline value. As there are no monitoring wells further down-gradient (i.e., to the east), the extent of PFAS in the Alluvium aquifer in the southeastern portion of the Management Area is uncertain. It is likely that the temporary increase was a seasonal effect due to higher rainfall in 2022 and surface water and groundwater interaction. PFAS were not detected in the deeper well at this location, MW057I, screened in the Tertiary Formation. Revision of the OMP will consider additional monitoring required to address the data gaps.
- Monitoring well MW054S, screened in the Alluvium, adjacent to Warrill Creek. The sum of PFOS and PFHxS concentration at MW057S was 0.38 µg/L in November 2022 and 0.35 µg/L in April 2023 compared to the previous maximum concentration of 0.14 µg/L in 2020/21. As there are no wells further south, the extent of PFAS in the Alluvium aquifer in the southern portion of the Management Area is uncertain. It is likely that the temporary increase was a seasonal effect due to higher rainfall in 2022 and surface water and groundwater interaction. PFAS were not detected in the deeper well at this location, MW054D, screened in the Walloon Coal Measures. Revision of the OMP will consider additional monitoring required to address the data gaps.

Additionally, the dataset has indicated variable PFAS concentrations in monitoring well MW020, located down-gradient of CPSA Z (fuel UST with AFFF). Concentrations increase in post-wet season monitoring events with PFAS concentrations doubling each year since 2020.

Surface Water and Sediment

- PFAS concentrations in surface water along Bremer River, Warrill Creek and drains have shown stable or variable concentrations during the monitoring period and were generally similar to historical results. One new exceedance of the recreational water guideline value was recorded in 2022 at SW094, along Bremer River in March/April 2022, however, PFAS were not detected at this location in October 2022.
- PFAS concentrations in most sediment samples from creeks during the monitoring period showed similar concentrations to historical results. New maximum concentrations were recorded in 14 sampling locations along on-Base drains, in particular following the high rainfall event in 2022, which suggests increased transport of impacted sediment in surface water flows. Guideline values have not been established for PFAS in sediment.
- Precautionary advice issued by the Queensland Government for the consumption of fish caught from Warrill Creek and Bremer River adjacent to the Base remains in place.

Following a review of the data collected during the monitoring period, some uncertainties have been identified regarding the lateral extent of PFAS in groundwater down-gradient of source areas and at boundary locations. Although no changes have been identified to the understanding of risks associated with the nature and extent of PFAS in the RAAF Base Amberley Management Area, additional data

would need to be collected to address the uncertainties to verify that the CSM and conclusions made in the DSI (CH2M Hill, 2018) still apply and the known human health and ecological risk profile of the Management Area is unchanged. Additional refinement of the monitoring network would improve the understanding of the extent of PFAS, as discussed in **Section 9.3**.

9.3 Assessment of Current OMP

Following a review of the data collected during the current monitoring period, there are three boundary locations at the RAAF Base Amberley Management Area where new maximum concentrations have been observed and increasing trends identified during the monitoring period and the spatial distribution of PFAS is uncertain. If the PFAS concentrations detected are verified during October 2023 and April 2024 sampling events, additional monitoring wells may be required to delineate the extent of PFAS in groundwater within the Management Area.

Due to the loss of some of the on-Base groundwater monitoring wells, there is limited information on groundwater quality down-gradient of three of the main source areas (CPSA A former topside aviation fire training area and current fire training area pad CPSA M fuel farm 1 and triple interceptor pit and CPSA Y, a former secondary FTA). There is also a data gap for PFAS concentrations in groundwater down-gradient of three boundary locations.

The monitoring network could be refined (including replacement of lost wells and new wells at down-gradient locations) to target the program on key areas of the Management Area. Due to the non-detection or low concentration of PFAS detected in some of the surface water and sediment sampling locations, it is considered that there is scope to refine the monitoring network to target locations that consistently report PFAS detections and reduce the frequency of sediment sampling.

The uncertainties identified above triggers the requirement to complete a review of the OMP.

10.0 Conclusions

Groundwater, surface water and sediment sampling was completed in general accordance with the SAQP (AECOM, 2023b) and to meet the objectives of the OMP (Defence, 2020) between March 2021 and May 2023.

- During the monitoring period, the concentrations of PFAS in groundwater at most groundwater sampling locations, were similar to previous results. During the monitoring period, the highest PFAS groundwater concentrations were detected at monitoring wells located down-gradient of previously identified primary PFAS source areas. The inferred extent of PFAS in groundwater is generally similar to that which was presented in the DSI (CH2M Hill, 2018), 2019 seasonal monitoring event reports (CH2M Hill, 2020a, b), 2020 AIR (AECOM, 2021b), however some uncertainties have been identified based on the dataset. These are as follows:
    - The extent of PFAS in groundwater to the west of MW030 at CPSA W along the western Base boundary.
    - The extent of PFAS in groundwater beyond Warrill Creek to the southeast of MW057S and south of MW054S.
    - The extent of PFAS in groundwater between the key Base source area (CPSA A) and boundary monitoring wells (such as MW034). This is due to the loss of down-gradient monitoring wells (MW008, MW039, MW040).
    - The extent of PFAS in groundwater close to CPSA M. This is due to the loss of monitoring well MW056.
    - The extent of PFAS in groundwater close to CPSA Y. This is due to the loss of monitoring well MW015.
    - Analysis of temporal trend data indicates some groundwater monitoring locations have seasonal changes. For example, groundwater samples collected from MW020, screened in the Tertiary Formation between 16.5 and 23.5 mbgl have shown higher PFAS concentrations during the post-wet season sampling events with concentrations doubling each year since 2020. Shallow monitoring wells located near creeks such as MW054S and MW057S had increases in PFAS concentrations following the high rainfall events in 2022 and the increases may be related to surface water and groundwater interactions with PFAS migrating with surface water being lost to groundwater.

  Revision of the OMP will consider additional monitoring required to address the data gaps.
- PFAS concentrations at surface water sampling locations were generally similar to historical results. Concentrations of PFAS in surface water vary between locations and over time. Temporal charts generally do not indicate any trends for PFAS concentrations (i.e., no clear linkage between the season of monitoring and increasing or decreasing PFAS concentrations). Changes in PFAS concentrations appear to be more directed to surface water and groundwater flow rates rather than seasonality. For sediment, the concentration ranges for PFOS and PFHxS have remained relatively consistent with historical data for creek locations. The detection of new maximum PFOS and PFHxS concentrations in two-thirds of sediment samples in drains during the monitoring period may relate to the increased flow rates associated with heavy rainfall transporting more impacted sediment along the drains.
- The CSM was reviewed, and based on the results presented within this report, no changes were identified to source, pathway or receptors at the Management Area. Due to the loss of on-Base wells and concentration increases in groundwater at some boundary locations there are some uncertainties regarding the lateral extent of PFAS.
- Although no changes have been identified to the understanding of risks associated with the nature and extent of PFAS in the RAAF Base Amberley Management Area, additional data would need to be collected to address the uncertainties and meet the objectives of the SAQP and OMP. Revision of the OMP will consider additional monitoring required to address the data gaps. Ongoing monitoring in accordance with the OMP is required to facilitate the decision-making process.
- No updates to the PMAP are proposed based on no changes to the CSM and risk profile.

I	Former FTA and Landfill (CSR_QLD_460)
J	Former FTA and Operations Testing Area and current location of Bomb Replenishment Apron
L	Former Fire Training and Operations Testing Area (CSR_QLD_478)
M	Former Fuel Farm 1 (CSR_QLD_000465) and Triple Interceptor Pit (CSR_QLD_000484)
N	Fire Station
O	F1- 11 2006 Incident
P	1978 Skyhawk Incident
Q	1 Squadron Hangar (CSR_QLD_000144) and 6 Squadron Hangar
R	K Store (CSR_QLD_000148)
S	AFFF Store, Washdown at Fuel Farm 2,2A (CSR_QLD_000468)
T	Aircraft F-4E Incident (CSR_QLD_472)
U	38 Squadron Hangar
V	AFFF Wastewater Holding Tank (CSR_QLD_000476)
W	Fire Fighting Training School (CSR_QLD_000464), inc. AFFF ponds and tanks, and AFFF pads
X	Former Structural and Open Pit FTA, currently occupied by 21 CONST SQN, incl. potential runoff area to the south and east
Y	Former Secondary Fire Training Area (CSR_QLD_000479)
Z	Fuel UST, with AFFF listing (CSR_QLD_485)
AA	Triple Interceptor pits at Engine Test Cell facilities 1 and 2
BB	Areas used for irrigation - former grass runways (CSR_QLD_000486 and CSR_QLD_000477)
CC	Former Landfill (CSR_QLD_000466)
DD	HS748 Former FTA on Disused Runway
EE	Former Sports Oval
FF	Buried PFAS impacted stockpile

Notes
All Hydrasleeves™ were installed a minimum of 24 hours prior to sampling
m - metres
m btoc - metres below top of casing
m AHD - metres above Australian Height Datum
TOC - Top of Casing
DO - Dissolved Oxygen
EC - Electrical Conductivity
Eh - Corrected Oxidation Reduction Potential
` - no data
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolts
°C - degrees Celsius

Notes
DO - Dissolved Oxygen
EC - Electrical Conductivity
Er - Uncorrected Oxidation Reduction Potential
Eh - Corrected Oxidation Reduction Potential
` - no data
Er converted to Eh by adding 205 based on a YSI with Ag/AgCl sensor calibrated to a 3.5 molar KCL solution
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolts
°C - degrees Celsius
*Insufficient sample volume to collect water quality parameters

LOR is limit of reporting
mg/kg is milligrams per kilogram
'-' denotes no analysis undertaken
'<' denotes concentration is less than
Sample results for SD518-SD530 are from PMAP Delivery project

Appendix C

Infrastructure Projects

Appendix C Infrastructure Projects

The table below presents a summary of recent infrastructure projects at the Base since 2019. The information was provided by the RAAF Base Amberley Environmental Sustainability Manager and the Estate Manager during the monitoring period.

Project	Works Dates	Location	Approx. volume of soil disturbed	Other comments
EST00736 Hangar 410 fire system repair/upgrade works	Mid 2019 to Oct 2020	Hangar 410	6000 m^3	Majority of earth works were completed in 2019 and were associated with the construction of a collection tank for wastewater from the fire suppression system.
EST03312 MWD works package	Aug 19 - Aug 20	Military Working Dog Kennel precinct, AP-2	100 m^3	Douglas Partners, Oct 2018, Report on Pre-construction Contamination Assessment Military Working Dog Works.
EST03306 EO Area Building Works	Dec 19 - Apr 20	EO precinct	3 m^3	Disturbed soil re-used on-Base.
EST01170 RAAFSFS Fire School Works	From end 2019 ongoing	Fire Training School AP-2	1100 m^3	Works include the upgrade of the fire training system, including road infrastructure, trenching and refurbishment of the holding ponds. Including soil, asphalt and concrete
EST03313 AP1-1 Building refurbishment	Jan - Nov 20	Property 1, Frog's Hollow	250 m^3	Douglas Partners, Feb 2019, Report on Pre-construction Contamination Assessment Amberley ADFIS.
LAND121 AdBlue facility works	Apr-Oct 2020	Base Vehicle Fuel Point	Unknown	Lendlease, LAND 121 Stage 2A Unite Sustainment Facilities, RAAF Base Amberley, Contamination Management Sub Plan, 11 March 2020.
25m Range works EST03293	Mar to Jul 2020	25 metre range	Unknown	Topsoil stripped and re-used, some earth disturbance for footings, contaminated sand from the bullet catcher removed.
Battlefield Airlifter project	2015 to 2022	Multiple sites	5,000 m^3	Laing O'Rourke is contractor. Multiple projects including evaporation ponds and fire main works.
Canberra bomber shelter works	May 2020	Old Front Gate	Minor	

Project	Works Dates	Location	Approx. volume of soil disturbed	Other comments
EST5909 DFI Operations and EST05334 9FSB works initial Base contamination investigation	Jul 2020	9FSB and adjacent to DFI	Unknown	Report, Aurecon, 27 July 2020, EST05334 RAAF Amberley 9RSG Workshop Pre-Construction Contamination Assessment
EST06218 HQ CSG compound	Jul to Aug 2020	Near BLD 901	Unknown	Investigation completed by Douglas Partners.
EST04769 EOD storage works	Started 2020	Compounds 470 and 633	1,023 m^3	Aurecon, 2 December 2019, Amberley Ordnance Storage Works - waste classification of soils.
EST06218 HQ CSG compound site investigation	Started 2020	Near BLD 901	200 m^3	Technical Memorandum, Golder to St Hilliers, Proposed Movement of Soil on-base at RAAF Amberley, 9 Oct 2020.
EST04138 Defence Fuel Transformation Program Risk Reduction Works	Oct 20 to Mar 21	FF2	20 m^3	Sampling will occur during works. Soil disturbance is associated with excavation of a slab for new tank footings.
6ESR Replacing Gravel driveway with concrete within unit lines	Oct - Dec 20	6ESR	< 10 m^3	Material re-used on-Base.
P1005 NAPMP Pavement Maintenance Works	2021 – 2022	Airfield	Unknown	Pavement repairs etc. PMCA was Aurecon. Contractor was Fulton Hogan.
P1005 NAPMP Apron Reconstruction Hangar 832	2021 - 2022	Hangar 832	>4,000m^3	Refer Epic Environmental Material Classification BLD 832 Apron, 18 Dec 2020.
EST03298 Base Roads upgrade	2021	Roads	Unknown	Cardno, 4 June 2020, EST03298 Amberley Base Roads Maintenance, Soil Characterisation Report.
Construction of new STP	Q2 2023-2024	STP	Unknown	PMCA is Jacobs, contractor is St Hilliers. Major facility upgrade.
P10 Runway upgrade	2022 ongoing	Airfield	Unknown	Fulton Hogan is contractor. Location for asphalt batching plant is being selected. Beneficial reuse of asphalt for perimeter tracks.
EST5349PH6 Growler	2022 ongoing	Various	Unknown	PMCA is Jacobs. Construction of offices. Design phase complete, site selection in process. One site environmentally sensitive area

Project	Works Dates	Location	Approx. volume of soil disturbed	Other comments
				identified (Koalas). Report in process.
DFI office works	2022-2023	Next to DFI	Unknown	Habitat clearance and excavation. PMCA Aurecon. Contractor is Apollo.
Air traffic control project	2015 ongoing	Airfield	Unknown	Location of new build has required removal of thousands of trees around the old air traffic control tower and significant excavation.
Northern perimeter fence around airfield	2022- 2023	Northern airfield	Unknown- small volume	Security fence being erected with 300-450 plinths with 600-1000mm deep postholes. Low volume of soil excavated and battered against fence.

Table of Contents

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has prepared this Sampling and Analysis Quality Plan (SAQP) for the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at RAAF Base Amberley (the Base) in the South Queensland Region.

The SAQP supports the PFAS OMP which was included in the Royal Australian Air Force (RAAF) Base Amberley PFAS Management Area Plan (PMAP) (Defence, 2020a), here-in referred to as the OMP.

The purpose of the OMP program is to collect data that will enable Defence to maintain an up-to-date understanding of the distribution, concentration and transport (migration pathways and flow) of PFAS at the RAAF Base Amberley Management Area. The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

1.2 SAQP Objectives

The objectives of this SAQP are to:

- Define the proposed scope of works in detail.
- Outline the proposed sampling methodology to be adopted.
- Outline the proposed data quality assurance and quality control (QA/QC) measures to be adopted.
- Define the data collection requirements for the project.

1.3 Scope of Works

To meet the project objectives, the following scope of works are proposed as per the OMP (Defence, 2020a):

- Sampling biannually (April 2020, October 2020, April 2021, October 2021, April 2022, October 2022, April 2023, October 2023, April 2024) at:
    - 40 groundwater monitoring wells.
    - 49 co-located surface water (where present) and sediment sampling locations.

  Preparation of reports including a sampling event factual report (following each biannual sampling event) and annual interpretive reports following the completion of each 12-month sampling period.

Since the OMP was issued in 2020 there have been some minor changes in the number of groundwater sampling locations due on-site monitoring wells being destroyed. **Section 4.3.2** to **Section 4.3.4** provides the updated list of sampling locations.

1.4 Guidelines and Legislation

The SAQP has been developed with reference to the following guidelines and legislation:

- PFAS National Environmental Management Plan (NEMP), Heads of Environmental Protection Agencies (HEPA), version 2.0, 2020.
- National Environment Protection (Assessment of Site Contamination) Measure (NEPM), National Environment Protection Council (NEPC), 2013.
- Department of Defence, Routine Environment Water Quality Monitoring Manual, 2016.
- Department of Defence, Contamination Management Manual (DCMM), 2018 amended 2021.

- Department of Health (DoH), Health Based Guidance Values for PFAS for use in site investigations in Australia, 2019.
- National Health and Medical Research Council (NHMRC), Guidance on PFAS in Recreational Water, August 2019.
- Standards Australia 1998. AS/NZ 5667:1998 Water Quality – Sampling.
- Australian and New Zealand Guidelines, 2018. Australian and New Zealand Guidelines for Fresh and Marine Water Quality.
- Environmental Protection Policy (Water and Wetland Biodiversity), 2019.

2.0 Site Identification and Conceptual Site Model

2.1 RAAF Base Amberley

The Base is the largest operational air force base in the Defence estate with over 7,000 personnel. It is located 7 kilometres (km) west of Ipswich and 50 km southwest of Brisbane. The facility is approximately 2,030 ha in area and includes the Base itself as well as several parcels of Defence-owned land to the east and south of the Base.

The Base operates two runways. The main runway runs approximately north to south, parallel to the eastern boundary. The second runway is shorter and runs southwest to northeast and is located in the southern part of the Base. Parallel to the main runway is a taxiway that services both runways and provides access to the main hangars. The majority of the operational areas, historical, current and 'planned for the future' are located to the west of the runways and taxiways.

2.2 RAAF Base Amberley Management Area

The RAAF Base Amberley Management Area is identified in the PMAP (Defence, 2020a) and has identified risks of exposure to PFAS that require management by Defence, refer to **Figure 1** in **Appendix A**. The extent of the Management Area is the geographical boundaries of the Base. Within this area there are specific PFAS source areas identified as contributing most significantly towards elevated risks that require management. The confirmed primary source areas (CPSA) relevant to this OMP include:

- CPSA A – Former topside aviation fire training area (FTA) and current FTA pad.
- CPSA B – Hangar 410 (Building 410) and former landfill.
- CPSA C – Frogs Hollow former fire training school.
- CPSA D – Sewage treatment plant.
- CPSA E – Historical containment pond.
- CPSA G – Former FTA and operational testing area.
- CPSA J – Former FTA and operational testing area.
- CPSA L – Potential former FTA and operations testing area.
- CPSA M – Former fuel farm 1 and triple interceptor pit.
- CPSA T – Potential location of aircraft F4E incident.
- CPSA V – AFFF wastewater holding tank.
- CPSA W – Fire fighting training school.
- CPSA X – Former structural and open pit FTA.
- CPSA Y – Former secondary FTA.
- CPSA Z – Fuel UST with AFFF listing.
- CPSA AA – Triple interceptor pit at Engine Test Cell facilities 1 and 2.
- CPSA BB – Areas used for irrigation- former grassed runways.
- CPSA CC – Former landfill.
- CPSA DD – HS748 Former fire training area on disused runway.

2.3 Conceptual Site Model

The conceptual site model (CSM) for RAAF Base Amberley is presented in detail in the detailed site investigation (DSI) (CH2M Hill, 2018[1]) which summarises the linkages between sources, pathways and receptors. The CSM is reviewed annually, as part of the annual interpretive report (AIR). The most recent AIR was the 2021 AIR, which was issued in February 2023 (AECOM, 2023).

[1] CH2M Hill, 2018, RAAF Base Amberley PFAS Investigation – Detailed Site Investigation, Rev. 6, November 2018.

3.0 Data Quality Assessment

3.1 Data Quality Objectives

The amended NEPM, Schedule B [2] Guideline on Site Characterisation (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process (EPA QA/G-4 EPA/240/B-06/001), February 2006.*

The US EPA defines the process as *'a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect'.*

The process of establishing appropriate DQOs is defined according to the following seven steps:

Table 1 The seven steps in defining DQOs

Step	Data Quality Objective Step
1	***State the problem*** – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	***Identify the goal of the study*** – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	***Identify information inputs*** – Identify data and information needed to answer study questions.
4	***Define the boundaries of the study*** – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	***Develop the analytic approach*** – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	***Specify performance or acceptance criteria*** – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	***Develop the plan for obtaining data*** – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed below. This incorporates the DQO information presented in the PMAP (Defence, 2020a).

3.1.1 Step 1 – State the Problem

PFAS source zones in soil and groundwater at the Base are contributing to PFAS discharges in surface water and drains from the Base. These discharges present elevated risks to human health and the environment.

Actions will be implemented to reduce these discharges and provide precautionary advice to the community in order to limit exposures. Monitoring is needed to assess the effectiveness of these actions, and to enable informed risk management decisions to protect human health and the environment.

Monitoring will also provide data to evaluate temporal variability and seasonal influence in PFAS concentrations in groundwater and surface water / sediment on- and off-base. This will facilitate refinement of the CSM, allow update of the human health and ecological risk assessment and inform management decisions by Defence and government agencies.

3.1.2 Step 2 – Identify the Goal of the Study

The overall goal of the study is to establish a systematic routine groundwater and surface water / sediment sampling and analysis program to provide current and ongoing information on the distribution and migration of PFAS contaminants of potential concern in groundwater and surface water / sediment in the RAAF Base Amberley Management Area.

Specific goals of the program are to:

- Understand the changes and trends in the nature, extent and magnitude of PFAS concentrations in the groundwater, surface water and sediment within RAAF Base Amberley Management Area to further refine the understanding of the distribution and variability of PFAS in the environment.
- Understand if the nature, extent and magnitude of PFAS concentrations has changed significantly due to management actions and other conditions to warrant a revision to the human health and environmental risk assessments.
- Provide an early warning as PFAS impacted surface water and groundwater migrates off-Base and discharges to surface water in the Bremer River and Warrill Creek.
- Collect additional data to inform future management actions and potential refinement of the RAAF Base Amberley CSM for PFAS.
- Monitor PFAS concentrations in Warrill Creek and in groundwater south of the Base, before and after construction and commissioning of the proposed new sewage treatment plant (STP), which will be designed to extract PFAS from effluent before it is discharged to the watercourse.
- Assess temporal and seasonal variation in the nature and extent of PFAS at the Base.

3.1.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the study goals listed in Step 2 above, the following inputs will be considered:

- Physical site setting.
- Meteorological data including rainfall.
- Previous and new data relevant to PFAS in soil, waters and biota obtained through the detailed site investigation (DSI) (CH2M Hill, 2018).
- Location and types of human and environmental receptors as defined in the DSI CH2M Hill, 2018).
- Surface water and groundwater flow regimes identified in the DSI CH2M Hill, 2018)and its CSM, and further refined as part of the 2019 monitoring events (CH2M Hill, 2019).
- Groundwater, surface water and sediment data collected and analysed for PFAS, per the SAQP.
- Groundwater and surface water elevation data.
- Field observations.
- Advances in laboratory analytical approaches and changes in regulatory requirements.
- Adopted assessment criteria for groundwater, sediment and surface water.

3.1.4 Step 4 – Define the Boundaries of the Study

The spatial and temporal boundaries that apply for data collection are detailed below and will influence the decision-making process for ongoing monitoring:

- The spatial boundary for data collection and decision making is the RAAF Base Amberley Management Area (refer to **Appendix A**), in particular the key surface water drainage pathways and groundwater between the Base and the Bremer River and Warrill Creek.
    - Surface water and sediment sampling will focus on discharges from the Base to the north east of the Base into the Bremer River and to the south of the Base into Frogs Hollow and Warrill Creek.

- Surface water and sediment sampling is also proposed upstream of the Base in both the Bremer River and Warrill Creek to monitor for potential transport of PFAS into the Management Area, from upstream polluters to the river and the creek.
- For groundwater, on-Base sampling will include wells screened in the Alluvium-Tertiary formations (shown to be relatively well connected and can be treated as one hydrogeological unit) and the Walloon Coal Measures.
- The off-Base sampling will focus on nested wells installed on public land that will monitor hydraulic migration of PFAS to the east and the nested pairs will allow monitoring of vertical migration between hydrogeological units. Nested wells to the south of the Base on State Government owned land (and privately leased) have also been included. Groundwater on this property is used for stock watering and the human health risk assessment (HHRA) has indicated elevated human health risk for consumption of home slaughtered beef on properties to the south of the Base.

- The sampling completed as part of the SAQP includes groundwater, surface water and sediment, at the frequencies defined in **Section 4**. In addition, ad hoc sampling for biota may also be required if changes in PFAS concentration in sediment indicate the need for assessment of the risk to biota.
- The requirements for long term monitoring (beyond three years) will be determined in the OMP review following the initial implementation period.

The SAQP will also cover the initial implementation period (two years) of the OMP (Defence, 2020a). The SAQP will also cover the extended implementation period to the extent required by specific characteristics of the Base and surrounds, and behaviour of the plume, measured against specified data trends.

3.1.5 Step 5 – Develop the Analytical Approach

The decision rules can be defined as:

- Analytical selection; all samples will be analysed for the extended PFAS suite.
- Analytical method selection for PFAS is based on achieving appropriate laboratory limits of reporting (LOR) in the various media to be analysed. Standard LOR will be used for the OMP Implementation.
- Sample locations have been selected with the objective of monitoring PFAS trends (temporal and seasonal), providing early warning of changes in the migration of PFAS in surface water and groundwater.
- If the laboratory QA/QC data are within the acceptable ranges, the data will be considered suitable for use.
- If PFAS concentrations are reported above the laboratory LOR, where it was previously <LOR, then it will be considered whether further assessment of the data will be required.
- If the PFAS is reported at a concentration that is above drinking water guideline in groundwater, then it will be considered that further assessment is required and / or notification.
- If the PFAS is reported at a concentration that is inside a trigger value or acceptable range, then it will be considered whether monitoring is continued or reduced, this assessment will be undertaken after two years of monitoring.
- If the data indicate a change to the risks defined in the DSI, human health risk assessment (HHRA) and ecological risk assessment (ERA), this may warrant further consideration, potentially via further investigation and review of the OMP.
- If the data does not conform with the CSM as outlined in the PMAP, this may warrant further consideration, potentially via further investigation and review of the OMP.

The decision on the acceptance of the analytical data will be made on the basis of the DQIs as follows:

- **Precision:** A quantitative measure of the variability (or reproducibility) of data.
- **Accuracy**: A quantitative measure of the closeness of reported data to the “true” value.

- **Representativeness**: The confidence (expressed qualitatively) that data are representative of each media present on site.
- **Completeness**: A measure of the amount of useable data from a data collection activity.
- **Comparability**: The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.

If the DQIs indicates the data to be suitable, then monitoring should be continued as per the OMP. If not, then a revision to the OMP should be undertaken, refer to **Section 3.2** for further details.

3.1.6 Step 6 – Specify Performance or Acceptance Criteria

Specific limits for the works included in the OMP (Defence, 2020a) are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and standard procedures for field sampling and handling.

It is expected that the most up-to-date investigation criteria endorsed by state and national regulations will be used to determine if data collected as part of the OMP indicates a change in the risk to human health or environmental receptors.

This step also examines the certainty of conclusive statements based on the available new data collected. This should include the following points to quantify tolerable limits:

- A decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative.
- A decision error in the context of the decision rule presented above would lead to either underestimation or overestimation of the risk level associated with a particular sampling area.
- Sampling errors may occur when the sampling program does not adequately detect the variability of a contaminant from point to point across the site. To address this, the OMP outlines minimum numbers of samples proposed to be collected from each media.
- As such, there may be limitations in the data if aspects of the OMP cannot be implemented. Some examples of this scenario include but are not limited to:
    - Proposed surface water sample locations may be dry at the time of sampling
    - Proposed groundwater well locations are damaged or destroyed and therefore cannot be sampled
    - Proposed samples are not collected due to access being restricted to a given location.
- Limitations in ability to acquire useful and representative information from the data collected. The data are proposed to be collected from multiple locations and sample media. Some examples of this scenario include:
    - Some of the data are proposed to be collected from landholder bores, which are not purpose-built for groundwater monitoring. In some cases, there is limited information on the bore construction, and the likely presence of dedicated pumps or windmills may prevent groundwater depths being accurately recorded while also preventing groundwater being sampled using low flow techniques.
- Measurement errors can occur during sample collection, handling, preparation, analysis and data reduction. To address this the following measures are proposed:
    - Collection of sufficient sample mass to facilitate analysis reported to standard laboratory detections limits. Collection of insufficient sample mass may result in raised detection limits.
    - Field staff to follow a standard procedure when collecting samples, including decontamination of tools, and use of appropriate sample containers and preservation methods.
    - Laboratories to follow a standard procedure when preparing samples for analysis and undertaking analysis.
    - Laboratories to report QA/QC data for comparison with the DQIs established for the SAQP.

As data are collected for the OMP, an analysis of trends will be undertaken with potential outliers identified. This analysis will include data collected as part of the DSI, HHRA and ERA as well as consideration of whether the data is reasonable in relation to the CSM. As more time series data is collected, a statistical approach to determining acceptance criteria may become possible, refer to **Section 3.2** for acceptance criteria for data quality.

3.1.7 Step 7 – Optimise the Design for Obtaining Data

The methodology presented in this SAQP is designed to meet the project objectives described in **Section 1.2** and to achieve the nominated DQOs. Optimisation of the data collection process will be achieved by:

- Working closely with the analytical laboratories and sampling equipment suppliers to ensure that appropriate procedures and processes are developed and implemented prior to and during the fieldwork, to ensure that sample handling, and transport to and processing by the analytical laboratories is appropriate.
- Conducting sampling according to Defence and Australian Standards for the type of sampling being conducted (i.e. groundwater monitoring well sampling versus landholder bore water sampling). These standards are as follows:
  - Department of Defence, DCMM, (July 2018, Amended August 2019).
  - Standards Australia (AS/NZS5667.11–1998) *Water Quality – Sampling, part 11: Guidance on sampling of groundwater.*
  - Standards Australia (AS 4482.1-2005) *Guide to the sampling and investigation of potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds.*
  - Standards Australia (AS 4482.2-1999) *Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile Substances.*
- Conducting sampling in accordance with AECOM's internal PFAS Sample Collection Guidance.
- Sampling conducted by suitably qualified and experienced field staff.
- Basing the sampling upon a CSM developed using the information available at the implementation of the SAQP. Updating the CSM as new data becomes available in the course of the implementation of the SAQP, as required.
- Progressive review of the data throughout the initial three-year OMP period and modification of sampling programs to optimise the value of data generated.

If the objectives of the SAQP are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of Data Quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

- Documentation and data completeness.
- Data quality – comparability, representativeness, precision and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use.

The acceptance criteria for DQIs for samples are specified in **Table 2**.

Table 2 Acceptance Criteria for Data Quality Indicators for Sample Analysis

Data Quality Indicators	Acceptance Criteria
Water and Sediment Samples	
Rinsates (where sampling equipment is reused) and Field blanks	Less than the laboratory LOR.
Field duplicates/Inter-lab duplicates	The relative percentage distributions (RPDs) will be assessed as acceptable if less than or equal to 30% as per the NEPM Schedule B3. Where the results shows greater than 30% difference a review of the cause will be conducted (NEPM, 2013). It is noted that RPDs that exceed this range may be considered acceptable where: • Results are less than 10 times the LOR (no limit). • Results are less than 20 times the LOR and the RPD is less than 50%. • Heterogeneous materials are encountered.
Laboratory duplicates	RPDs less than: • 20% for high level laboratory duplicates (i.e. >20 x LOR). • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR).
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's QC report, based on their historical database.
Method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between laboratories specified range for each particular analyte / analytical suite.

4.0 Sampling Location Rationale and Methodology

4.1 OMP

The OMP (Defence, 2020a) presents an overview of specific monitoring works to be undertaken and provides the basis for the preparation of this SAQP. This scope of work presented in this SAQP is consistent with that detailed in the OMP (Defence, 2020a), with the exception of those points of deviation presented in **Section 4.15**.

4.2 Proposed Schedule

4.2.1 Sampling Events

Groundwater, surface water and sediment sampling from across the RAAF Base Amberley Management Area will be performed biannually in April and October, with the first sampling event scheduled to be completed in April 2020.

The proposed schedule of fieldworks is presented in **Table 3** below.

Table 3 Proposed Fieldwork Schedule

Sampling Round No.	Description of works	Proposed Schedule
1	Biannual groundwater, surface water and sediment sampling event	April 2020
2		October 2020
3		April 2021
4		October 2021
5		April 2022
6		October 2022
7		April 2023
8		October 2023
9		April 2024

Groundwater level monitoring at the Base to date has shown variability between end of wet season and end of dry season sampling events with up to 3 m difference.

During the dry season (October 2020), opportunities to collect surface water samples can be limited on-Base as drains are likely to be dry. During the OMP dry season monitoring event, if there is rainfall during the six weeks prior to the scheduled event, then opportunistic sampling of surface water from the Base drains should be conducted to ensure samples are collected.

4.3 Sample Location Rationale

4.3.1 Groundwater Sampling Locations

Groundwater monitoring will be undertaken on selected monitoring wells. The rationale for monitoring well selection for each area is summarised in **Table 4** below.

Table 4 Rationale for Groundwater Monitoring Locations

Area	Rationale
On-Base Alluvium, Tertiary Formation and Walloon Coal Measures aquifers	• Monitor spatial and temporal variations in PFAS concentrations in groundwater concentrations up, down and cross-gradient of source areas. • Assess if groundwater PFAS concentrations in bores to the north, east, west and south of the Base change in response to management measures over time. • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations. • Monitor groundwater parallel and perpendicular to the PFAS plume to assist with understanding changes in concentrations in these alignments. • Monitor surface water quality in Bremer River and Warrill Creek to assess PFAS migrating from the source areas via drainage channels. • Monitoring groundwater quality adjacent to the Bremer River and Warrill Creek to assess PFAS migrating from surface water to groundwater. • Assess if groundwater PFAS concentrations in bores to the south of the Base change following redevelopment of the Sewage Treatment Plant.
Off-Base Alluvium, Tertiary Formation and Walloon Coal Measures aquifers	• Monitor spatial and temporal variations in PFAS concentration in the groundwater down gradient of the Base. • Continue to monitor groundwater bores with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations. • Assess if groundwater and surface water PFAS concentrations in change in response to management measures over time. • Monitoring groundwater quality adjacent to the Bremer River and Warrill Creek to assess PFAS migrating from surface water to groundwater.

Note: Off-base sampling on private land will require the agreement of the landholder/leaseholder.

4.3.2 Groundwater Sampling Locations

The groundwater locations to be monitored as part of the sampling events are provided in **Table 5** below and are presented in **Figure 2** in Appendix A.

Table 5 Groundwater sampling locations

Location		Monitoring Well	No. of locations
Source Areas	Major CPSA A Former Topside Aviation FTA and current FTA Fire Pad	MW002*, MW033	2
	Major CPSA B Hangar 410 and Former Landfill	MW047	1
	Major CPSA C Frogs Hollow Former Fire Training School Location	MW037	1
	Major CPSA D Sewage Treatment Plant	MW021, MW032	2
	Moderate CPSA E Historical Containment Pond	MW048	1

Note: *Italics* indicates well in private property, * MW002 was formerly known as MW2.

4.3.3 Groundwater Level Monitoring

During the DSI (CH2M Hill, 2018), pressure/water level transducers were installed to assess the interconnectivity between surface water and groundwater. The transducers are installed in MW28, MW32, MW34, MW55D, MW55S, MW56I and MW56S. These locations were selected to collect time series measurements of potentiometric head in wells nearest the river gauges (owned by Ipswich City Council or SEQ Water). These locations have been surveyed using high accuracy techniques. Standing water levels and surface water levels will be recorded during the biannual sampling events. Data from pressure/water level transducers at these locations will be downloaded during each biannual sampling event to assist in the assessment of surface water/groundwater connectivity.

One barometer logger was also installed during the DSI to allow for the adjustment of the effects of atmospheric pressure changes on water levels. Only one barologger was installed at the Base, since atmospheric conditions do not vary laterally. Data from the barologger should be collected to correct the loggers if major atmospheric pressure changes occur during the logging period (e.g. storms/fronts).

4.3.4 Surface Water and Sediment Sampling Locations

The surface water and sediment sampling locations to be monitored as part of the sampling events are provided in **Table 6** below and are presented on **Figure 3** in Appendix A. A table showing historical and current sample identification numbers is presented in Appendix B.

Table 6 Surface Water and Sediment Sampling Locations

Area	Sampling Locations	Number of Locations
On-Base Drains	SD/SW002, SD/SW003, SD/SW008, SD/SW011, SD/SW021, SD/SW027, SD/SW028, SD/SW030, SD/SW033, SD/SW037, SD/SW038, SD/SW041, SD/SW048, SD/SW049, SD/SW053, SD/SW056, SD/SW059, SD/SW079, SD/SW064, SD/SW067, SD/SW076, SD/SW080	22
Warrill Creek	SD/SW004, SD/SW005, SD/SW009, SD/SW015, SD/SW016, SD/SW018, SD/SW020, SD/SW026, SD/SW034, *SD/SW070*, SD/SW099, SD/SW100	12
Bremer River	SD/SW025, SD/SW036, SD/SW039, SD/SW040, SD/SW045, SD/SW047, SD/SW050, SD/SW051, SD/SW052, SD/SW088, SD/SW089, SD/SW090, SD/SW091, SD/SW094, SD/SW098	15

Note: *Italics* indicates well in private property

4.4 Sample Collection and Handling

4.4.1 Groundwater Sampling

The groundwater sampling methodology and schedule are presented in **Table 7**.

Table 7 Groundwater Sampling Methodology and Schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured in each monitoring well immediately prior to collection of groundwater samples. Gauging of the wells will take place in as short a time as possible, however, it is noted that due to access constraints due to ongoing operations and the large number of wells (40), it is difficult to collect gauging data from all the wells in a short timeframe and may take a few days to complete the gauging.
Sample Collection Methodology	Groundwater samples will be collected from all monitoring wells using no-purge methodology HydraSleeves™, which will be installed to the target depths specified in Appendix B, within the screened interval of the wells for a minimum of 24 hours prior to the sampling round. Monitoring well construction details are presented in Appendix B. Once sampling is completed, new HydraSleeves™ will be deployed to the target depths specified in Appendix B, within the screened interval depth in preparation for the next sampling round.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), equipment rinsate blank (rinsate) samples and field blank samples. Duplicate samples are to be collected at a minimum frequency of 1 in 10 primary samples. Rinsate samples are to be collected at a rate of one sample per fieldwork day by pouring laboratory supplied PFAS-free deionised water over the decontaminated sampling equipment.

Item	Details
Field Parameters	Field observations, temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality will be recorded for all samples.
Decontamination Procedures	Non-dedicated equipment in contact with groundwater (i.e. interface probe and water quality meter probe) will be decontaminated by being cleaned with a PFAS-free detergent and PFAS-free deionised water supplied by the analytical laboratory.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.
Sampling Schedule	The monitoring at RAAF Base Amberley will include two biannual monitoring events in April and October. Both sampling events will include the sampling of up to 40 groundwater monitoring wells.

4.4.2 Surface Water Sampling

The surface water sampling methodology and schedule is presented in **Table 8**.

Table 8 Surface Water Sampling Methodology and Schedule

Item	Details
Sample Collection Methodology	Samples to be collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container will be lowered into the water with the cap immediately applied once the container is full.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), equipment rinsate blank (rinsate) samples and field blank samples. Duplicate samples are to be collected at a minimum frequency of 1 in 10 primary samples. Rinsate samples are to be collected at a rate of one sample per fieldwork day by pouring laboratory supplied PFAS free deionised water over the decontaminated sampling equipment.
Field Parameters	Field observations, temperature, EC, DO, ORP, pH and observations of water quality will be recorded for all samples.
Decontamination Procedures	Non-dedicated equipment in contact with groundwater (i.e. interface probe and water quality meter probe) will be decontaminated by being cleaned with a PFAS-free detergent and PFAS-free deionised water supplied by the analytical laboratory.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.
Sampling Schedule	The monitoring at RAAF Base Amberley will include two biannual monitoring events in April and October. Both sampling events will include the collection of 49 surface water samples.

4.4.3 Sediment Sampling

The sediment sampling methodology and schedule are outlined in **Table 9**.

Table 9 Sediment Sampling Methodology and Schedule

Item	Details
Sample Collection Methodology	Samples representative of potentially deposited sediments to be collected from within the water body if possible. Sediment samples will be collected using a trenching shovel from the base of the drain (where possible), or using a Dormer Piston Sediment Sampler or a hand-grab sample using a clean pair of nitrile gloves. At each location, a new laboratory supplied container will be used for each sample.
QA/QC Samples to be Collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), equipment rinsate blank (rinsate) samples and field blank samples. Duplicate samples are to be collected at a minimum frequency of 1 in 10 primary samples. Rinsate samples are to be collected at a rate of one sample per fieldwork day by pouring laboratory supplied PFAS free deionised water over the decontaminated sampling equipment.
Sample Analysis	All primary samples will be submitted for PFAS extended suite using the standard levels of detection.
Sampling Schedule	The monitoring at RAAF Base Amberley will include two biannual monitoring events in April and October. Both sampling events will include the collection of 49 sediment samples.

4.4.4 Sample Handling and Transport to Laboratory

AECOM personnel will attempt to reduce potential heterogeneity in the sample media matrix by dividing the sample collected between primary and intra-laboratory jars or bottles during sampling. All samples will be placed on ice in eskies immediately after sampling.

All samples will be kept, if possible, at or below 4°C during transit to the laboratory. Prior to sampling, assessment of the analytical holding times will be made and the sampling planned accordingly to help ensure that holding times are not breached or are minimised as far as practicable.

Samples will be transported to the laboratory for analytical testing under standard chain of custody (CoC) documentation. Primary and associated duplicate QA/QC samples will be analysed by ALS Brisbane. The inter-laboratory duplicate samples will be analysed by the National Measurement Institute (NMI) or Eurofins Brisbane laboratory.

4.5 Calibration

The water quality meter will be calibrated each day prior to the commencement of field activities with relevant solutions, including pH, EC and ORP. The calibration will be in accordance with manufacturers' instructions or National Association of Testing Authorities (NATA) publication "General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note N0. 19 (NATA 1994)". Where satisfactory calibration cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration details will be recorded on field sheets and included in the Sampling Events Factual Reports.

A calibrated interface probe should be used for the gauging of the monitoring wells with a copy of the calibration certificate included in the Sampling Event Factual Reports.

4.6 Logistics

The laboratory sample containers will be collected from the laboratory prior to the commencement of fieldwork. All samples will be transported to ALS by the field team or a supplied courier at the completion of fieldwork. All inter-laboratory duplicate samples will be couriered direct to the secondary laboratory under a separate CoC documentation for analysis.

4.7 Analytical Suite and Laboratory Analysis Methods

4.7.1 Laboratory NATA Accreditation Details

The laboratory is required to use NATA accredited methods based on NEPM, US EPA, Table B 15 of the US Department of Defence/Department of Energy (US DOD/DoE) and American Society for Testing and Materials (ASTM) methods as appropriate.

The primary laboratory selected for this program is ALS (NATA Accreditation Number 825). The secondary laboratories selected for this program are NMI (NATA Accreditation Number 198) and Eurofins Brisbane (NATA Accreditation Number 1261).

4.7.2 Analytical Schedule

All media sampled shall be analysed for the extended PFAS suite as outlined in **Table 10** below.

Table 10 Sample Analytical Suite for PFAS

PFAS Group	Compound	CAS No.
Perfluoroalkyl Sulfonic Acids	Perfluorobutane sulfonic acid (PFBS)	375-73-5
	Perfluoropentane sulfonic acid (PFPeS)	2706-91-4
	Perfluorohexane sulfonic acid (PFHxS)	355-46-4
	Perfluoroheptane sulfonic acid (PFHpS)	375-92-8
	Perfluorooctane sulfonic acid (PFOS)	1763-23-1
	Perfluorodecane sulfonic acid (PFDS)	335-77-3
Perfluoroalkyl Carboxylic Acids	Perfluorobutanoic acid (PFBA)	375-22-4
	Perfluoropentanoic acid (PFPeA)	2706-90-3
	Perfluorohexanoic acid (PFHxA)	307-24-4
	Perfluoroheptanoic acid (PFHpA)	375-85-9
	Perfluorooctanoic acid (PFOA)	335-67-1
	Perfluorononanoic acid (PFNA)	375-95-1
	Perfluorodecanoic acid (PFDA)	335-76-2
	Perfluoroundecanoic acid (PFUnDA)	2058-94-8
	Perfluorododecanoic acid (PFDoDA)	307-55-1
	Perfluorotridecanoic acid (PFTrDA)	72629-94-8
	Perfluorotetradecanoic acid (PFTeDA)	376-06-7
Perfluoroalkyl Sulfonamides	Perfluorooctane sulphonamide (FOSA)	754-91-6
	N-Methyl perfluorooctane sulfonamide (MeFOSA)	31506-32-8
	N-Ethyl perfluorooctane sulfonamide (EtFOSA)	4151-50-2
	N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)	2448-09-7

PFAS Group	Compound	CAS No.
	N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE)	1691-99-2
	N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)	2355-31-9
	N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)	2991-50-6
(n:2) Fluorotelomer Sulfonic Acids	4:2 Fluorotelomer sulfonic acid (4:2 FTS)	757124-72-4
	6:2 Fluorotelomer sulfonic acid (6:2 FTS)	27619-97-2
	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	39108-34-4
	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	120226-60-0

The current standard laboratory limits of reporting (LOR) are described in **Table 11** below.

Table 11 Laboratory Limits of Reporting

Sample Media	Parameter	Technique/Method Reference	LOR*
Groundwater and Surface Water	Extended PFAS Suite	LC/MS-MS	0.002 – 0.1 µg/L
Sediment	Extended PFAS Suite	LC/MS-MS	0.0002 – 0.001 mg/kg

LC/MS-MS = Liquid chromatography–mass spectrometry, GC = Gas chromatography

*LOR for Australian Laboratory Services (ALS)

4.8 Sample Nomenclature

In order to meet Defence data management requirements, a consistent sample nomenclature has been adopted for the Program. All primary samples will be labelled using the following Defence Contamination Management Manual (DCCM) naming convention:

PPPP_XX000_ZZZ_YYMMDD

[property ID]_[type of sample][THREE DIGIT sample number]_[top of sample depth]_[yearmonthday]

e.g. 0861_MW001_191015

Location types and codes are prescribed by Defence and the Site's investigation history.

Primary Sample Types/Location Codes relevant to this OMP include:

- SD = sediment – top depth required
- MW = monitoring well
- SW = surface water - no depth required

QA/QC Samples will be labelled in accordance with the following convention:

- Duplicate: PPPP_QC1XX_YYMMDD
- Triplicate: PPPP_QC2XX_YYMMDD
- Rinsate: PPPP_QC3XX_YYMMDD

4.9 Defence ESdat Requirements

Defence has contracted Earth Science Information Systems (EScIS), to provide contamination data management services through a cloud instance of its ESdat product.

All OMP field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's ESdat database in accordance with Section 6 of Annex L to the Defence Contamination

Management Manual (Defence, 2018). AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will upload the data from each monitoring event into ESdat prior to submitting the Sampling Event Factual Report.

4.10 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this SAQP, a number of guidance documents were in circulation in Australia including:

- PFAS NEMP, version 2.0 (HEPA 2020).
- DoH, 2019. Health Based Guidance Values for PFAS for use in site investigations in Australia. 2019.
- NHMRC, 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC 2019).
- NEPM 1999, Schedule B1, as amended in 2013 (NEPC, 2013).

The adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 12** below. This adopts the criteria specified in the PMAP (Defence, 2020a).

Table 12 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values presented are from HEPA (2020). *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values presented are from the NHMRC (2019). *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (95% species protection values)	PFOS	0.13 µg/L	The values are from the HEPA (2020). *All surface water and groundwater results will be compared to these criteria.*
	PFOA	220 µg/L	
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	
	PFOA	19 µg/L	

There are no current PFAS screening criteria in Australia for sediment.

4.11 Waste Management

Due to the proposed “no purge” sampling methodology, it is not anticipated that significant volumes of liquid waste would be generated that would require management or disposal.

No waste soil will be generated due to the proposed grab sampling approach.

All consumables (i.e. HydraSleeves™, filter cartridges, general rubbish) will be bagged and placed in on-site general waste bins for disposal.

4.12 Quality Assurance/Quality Control Sampling

4.12.1 Field Duplicate and Inter-laboratory Duplicate Samples

Field duplicate (intra-laboratory) duplicate samples and split (inter-laboratory field duplicates) are to be collected and analysed at a minimum frequency of 1 in 10 primary samples.

4.12.2 Rinsate Samples

Rinsate samples are to be collected at a rate of one sample per fieldwork day or at least one rinsate sample per ten primary samples (whichever rate is lower) by pouring laboratory supplied deionised water over the decontaminated sampling equipment.

4.12.3 Field Blank Samples

Field blank samples are to be collected at a rate of one sample per fieldwork day by filling sample containers with laboratory supplied deionised water in the field. This exposes the field blanks to the atmosphere of the sampling site.

4.12.4 Trip Blank Samples

Trip blank samples will be supplied by the laboratory and placed in sample transport eskies at a rate of one per batch of samples. The trip blank samples will be analysed for PFAS to assess if any contaminants have entered the sample containers during sampling or in transit to the laboratory or the container itself.

4.13 Fieldwork Documentation

4.13.1 Field Notes

Field notes will be maintained to record all field sampling events and include observations made at each sample location. Field notes will include information specific to the sample media as follows:

- Groundwater and surface water samples – comments on the observed characteristics of the sample (e.g. colour, turbidity, odour, sheen) and reported field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded.
- Sediment samples - comments on the morphology of the sample location, the depth, flow direction and strength of water flow (if water is present), the water and sediment/soil colour and odour, and the presence of flora and fauna. The soil/sediment types observed at each sample location will be described using the Unified Soil Classification System (USCS).

The coordinates for each sample location will be noted. The location of quality control (e.g. duplicate and inter-laboratory duplicate) sample collection points will also be noted.

AECOM's tablet-based data capture ('EDCA') system will be utilized by field staff to minimise potential data recording errors and allow on-the-spot identification of potentially erroneous data in comparison to historical data.

4.13.2 Sample Labels

AECOM will utilise the tablet-based ALS 'Compass' sample management application to streamline sample labelling and CoC creation to ensure compliant sample IDs are used in the field.

Sample containers will also be labelled with the sample ID as a failsafe method with the following information:

- AECOM project number.
- Name of sampler.
- Sample ID.
- Date of sample collection.

- Filtered vs non-filtered (for water samples only).

A ball point pen will be used for labelling, to ensure PFAS is not introduced to the samples from permanent markers.

4.13.3 Chain of Custody Forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory.

The CoC form will include the following information:

- Job number (Note: the name of the site is not identified for confidentiality purposes).
- Date and time of sample collection.
- Sample ID.
- Type of containers.
- Name of sampler.
- Laboratory to be used.
- Analyses required.
- Any comments.
- Signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the Field Team, (i.e. samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed and the due date for the analytical results.

4.13.4 Sampling Documentation

Field sampling sheets will be completed for each location, and will include the following information (as appropriate for the media being sampled):

- Name of sampler.
- Sample location.
- Date /time of monitoring/ sampling.
- Sampling method.
- Observations of the sampled media.
- Calibration records.

Records of all equipment calibration will be included in the Sampling Event Factual Reports. Photographs of surface water sampling locations will be taken where permitted.

4.14 Reporting

4.14.1 Sampling Event Factual Report

No later than four weeks following receipt of the laboratory reports, AECOM will prepare and submit a Sampling Event Factual Report to Defence. The report will be in accordance with the guidance document (Defence, 2020b). Each Sampling Event Factual Report will include:

- Details of the scope of monitoring completed.
- A description of the sampling methodologies used
- A summary of observations made while sampling (e.g. any visual or olfactory observations that may indicate impacts to surface water or groundwater)
- A summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement of decommissioning of a location
- A presentation of the analysis results in a table that includes comparisons with PFAS guidelines, highlighting any significant statistical deviations from historical monitoring and investigation data
- A presentation of the reduced groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction
- Discussion of the analytical data quality, including review of the quality control sampling results and laboratory quality control data
- Inclusion of the following information as attachments:
    - Figures
    - Tables
    - Groundwater sampling forms including field water quality parameter measurements;
        i. Chain of custody forms;
        ii. Laboratory analytical certificates; and
        iii. Equipment calibration certificates.

4.14.2 Annual Interpretive Report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Annual Interpretive Report to Defence. Each Interpretive Report will include:

- Evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Defence, 2020a).
- Relevant figures depicting sampling locations and site-specific hydrogeological features.
- Laboratory results and analysis including comparison with relevant screening criteria as identified in each OMP (Defence, 2020a).
- Assessment and commentary on appropriate QA/QC procedures,
- A review of the CSM and provision of a revised CSM if required.
- Data interpretation, including trends in groundwater concentration, gradient and flow directions.
- Assessment of statistically based trends that may inform decision making when it comes to the revision of an OMP (Defence, 2020a).
- A statement as to whether the risk profile has changed overall, or for any specific location at the Site, and a recommendation as to whether this should trigger an OMP and/or PMAP review, or other action.

4.15 Deviations from OMP

While the scope of works and methodology described in this SAQP are generally consistent with that presented in the OMP (Defence, 2020a), some points of deviation are noted (refer to **Table 13** below).

Table 13 Deviations from OMP

No.	Description	Rationale
1	Changes to the analytical suite.	The PMAP (Defence, 2020a) specified all water samples were to be analysed for major cations and anions. For the first two sampling events in 2020, approximately 20% of samples were analysed for a non-PFAS suite. Following a review of the SAQP, the collection and analysis of samples for non-PFAS analytes is not justified at the Base at this time to meet the requirements of the OMP and hence has been removed from the analytical schedule.
2	Removal of lost / damaged monitoring wells from the OMP.	In 2021, six monitoring wells were not accessible including MW008, MW009, MW015, MW039, MW040 and MW056 (formerly known as MW002). These were removed from the Revision 4 SAQP. An OMP review is being completed in 2023, which will consider the need for replacement monitoring wells.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) (Defence, 2020) at the Royal Australian Airforce (RAAF) Base Amberley (the 'Site') and the Management Area in the South Queensland Region. The locations of the Site and Management Area are shown on **Figure 1** in **Appendix A**.

The OMP for RAAF Base Amberley (Defence 2020) includes the following sampling events:

- Biannual groundwater, surface water and sediment sampling in April and October in 2020, 2021, and 2022.

Following each biannual sampling event, sampling event factual reports will be prepared. Annual interpretative reports will be prepared following the completion of each 12-month sampling period. This sampling event factual report has been prepared to report the results of the biannual sampling event completed in March / April 2021, specifically highlighting first time detections and/or first-time exceedances of human health screening criteria for PFHxS+PFOS and / or PFOA.

This report has been prepared in accordance with the *PFAS OMP Factual Reports Guidance,* v 0.2, May 2021 (Defence, 2021).

1.2 Objectives

The objectives of the OMP are to:

- Implement the OMP prepared as part of the PFAS Management Area Plan (PMAP); and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration and transport of PFAS at each property.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

The objective of this phase of works was to implement the scope of works for the March / April 2021 sampling event in accordance with the sampling and analysis quality plan (SAQP) (AECOM, 2021a).

2.0 Scope of Work

The sampling event at RAAF Base Amberley was completed in general accordance with the SAQP (AECOM, 2021a). In summary, the scope of works for this sampling event included:

- Obtaining access to private properties where some groundwater sampling locations are situated.
- Review of the SAQP prior to the monitoring event to ensure compliance with the following:
  - PFAS National Environmental Management Plan (NEMP) (2020)
  - National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013)
  - Defence Routine Environment Water Quality Monitoring Manual
  - AS/NZ 5667:1998 Water quality – Sampling
  - Australian and New Zealand Guidelines for Fresh and Marine Water Quality; and
  - Relevant State regulatory guidelines.
- Gauging of groundwater elevation in all monitoring wells prior to collection of samples (refer to **Table 1** below, and **Figure 2** in **Appendix A** for specific locations).
- Collection of groundwater samples at 46 locations including 40 on-Site monitoring wells and six off-Site monitoring well locations. Details are included in **Table 1** below and **Figure 2** in **Appendix A**. Groundwater samples from eight monitoring wells could not be collected during this sampling event. Refer to **Table 9** for more details.
- Collection of co-located surface water and sediment samples at 49 locations, including 42 on-Site locations, and seven off-Site locations (refer below to **Table 2** and **Table 3** and **Figure 3** in **Appendix A**). It is noted that one surface water sample could not be collected during this sampling event. Refer to **Table 11** for more details.
- Downloading groundwater level data from data loggers installed in seven groundwater monitoring wells (MW028, MW032, MW034, MW055S, MW055D, MW056S, MW056I), refer to **Figure 2** in **Appendix A** for data logger locations.
- Collection of intra- and inter- laboratory duplicate samples at a rate of 1 in 10 primary samples, one field blank sample per day, one rinsate sample per fieldwork day and one trip blank per batch.
- Analysis of all samples for the PFAS suite at the standard limit of reporting (LOR).
- Data management of all OMP field and laboratory data in the Defence ESdat database.
- Preparation of results letters for off-Site stakeholders.
- Preparation of this Sampling Event Factual Report.

Table 1 Groundwater Sampling Locations

Location		Monitoring Wells
Source Areas	Former Topside Aviation Fire Training Area (FTA) and current FTA Fire Pad (Confirmed Primary Source Area [CPSA] A)	MW002, MW008, MW009, MW033, MW039, MW040
	B Hangar 410 and Former Landfill	MW047
	Frogs Hollow Former Fire Training School Location (CPSA B)	MW037
	Sewage Treatment Plant (CPSA D)	MW021, MW032
	Historical Containment Pond (CPSA E)	MW048
	Former Fire Training Area and Operational Testing Area (CPSA G)	MW050
	Former Fire Training Area and Operational Testing Area (CPSA J)	MW005
	Potential Former Fire Training Area and Operations Test Area (CPSA L)	MW006, MW023, MW028, MW029, MW036
	Former Fuel Farm 1 and Triple Interceptor Pit (CPSA M)	MW056, MW309
	Potential Location of Aircraft F-4E Incident (CPSA T)	MW035
	AFFF Wastewater Holding Tank (CPSA V)	MW046
	Fire Fighting Training School (CPSA W)	MW026, MW030, WM031, MW042, MW043
	Former Structural and Open Pit Fire Training Area and Former Secondary Fire Training Area (CPSA X and Y)	MW015, MW041
	Fuel UST with AFFF listing (CPSA Z)	MW020
	Triple Interceptor Pits at Engine Test Cell Facilities 1 and 2 (CPSA AA)	MW007
	Areas used for irrigation – former grassed runways (CPSA BB)	MW012
	Former Landfill (CPSA CC)	MW022
	Former Fire Training Area on Disused Runway (CPSA DD)	MW049
Off-Site Warrill Creek		*MW054S, MW054D,* MW057S, MW057I
On-Site Bremer River		MW024, MW025, MW034, MW044, MW055S, MW055D
Off-Site Bremer River		MW056S, MW056I

Note: *Italics* indicates that the well location is in private property
Wells with S, D or I are adjacent monitoring wells that are screened in different aquifers . S indicates the well is screened in the shallow aquifer, D or I indicates the well is screened in the deeper aquifer.
MW002 was formerly known as MW2. MW056 was formerly known as MW002.

Table 2 Surface Water Sampling Locations

Area	Surface Water Sampling Locations	Number of Locations
On-Base Drains	SW002, SW003, SW008, SW011, SW021, SW027, SW028, SW030, SW033, SW037, SW038, SW041, SW048, SW049, SW053, SW056, SW059, SW064, SW067, SW076, SW079, SW080	22
Warrill Creek	SW004, SW005, SW009, SW015, SW016, SW018, SW020, SW026, SW034, SW043, SW099, SW100	12
Bremer River	SW025, SW036, SW039, SW040, SW045, SW047, SW050, SW051, SW052, SW088, SW089, SW090, SW091, SW094, SW098	15

Table 3 Sediment Sampling Locations

Area	Sediment Sampling Locations	Number of Locations

Bremer River	SD025, SD036, SD039, SD040, SD045, SD047, SD050, SD051, SD052, SD088, SD089, SD090, SD091, SD094, SD098	15

3.0 Methodology

The methodology used for the March/April 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised below. Deviations from the SAQP are discussed in **Section 3.6**.

3.1 Groundwater Sampling Methodology

The groundwater sampling methodology is outlined in **Table 4** below.

Table 4 Groundwater Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater was measured in each monitoring well using an interface probe prior to the installation of HydraSleeves™, or if HydraSleeves were already installed, prior to retrieval of the HydraSleeve. Gauging was conducted in as short a time as possible, however, due to the number of wells and different requirements for accessing the monitoring well locations, the gauging took place over several days. Water level transducers are installed in seven monitoring wells to continuously record groundwater levels. Data collected since the previous OMP sampling event in October 2020 was downloaded.
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all groundwater samples.
Sampling methodology	Groundwater samples were collected from the majority of monitoring wells using no-purge methodology HydraSleeves™, which were installed within the screened interval of each well (based on a review of the well construction log) for a minimum of 24 hours prior to the sampling round. Once sampling was completed, new HydraSleeves™ were deployed at the screened interval depth in 18 of the monitoring wells in preparation for the next sampling round. HydraSleeves were not installed in 21 monitoring wells as they are regularly used for monitoring on other programs. There was insufficient groundwater in one monitoring well (MW054S) for HydraSleeve sampling. The groundwater sample was collected using a disposable single use HDPE ecobailer.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QA/QC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for analysis for the PFAS suite using the standard levels of detection. ALS Environmental (ALS) Brisbane, Queensland was used as the primary laboratory. The National Measurement Institute (NMI) of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses are certified by the National Association of Testing Authorities (NATA). Chain of custody (COC) forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.2 Surface Water Sampling Methodology

The methodology used for the March/April 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised in **Table 5** below.

Table 5 Surface Water Sampling Methodology

Item	Details
Field parameters	Temperature, electrical conductivity, dissolved oxygen, oxidation-reduction potential, pH and observations of water quality were recorded for all surface water samples.
Sample Collection Methodology	Samples were collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container was lowered into the water with the cap immediately applied once the container was full.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QAQC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses were certified by the NATA. Chain of custody forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.3 Sediment Sampling Methodology

The methodology used for the March/April 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised in **Table 6** below.

Table 6 Sediment Sampling Methodology

Item	Details
Sample Collection Methodology	Samples representative of potentially deposited sediments were collected from within the water body where possible. Sediment samples were collected by hand using new laboratory supplied nitrile gloves and a new laboratory supplied container at each location.
Logging	Sediment characterisation were recorded for each sample.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QAQC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses were certified by the NATA. Chain of custody forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.4 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- PFAS NEMP, (HEPA 2020)
- Department of Health, 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia,* September 2019
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water, August 2019 (NHMRC 2019)
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013).

In accordance with the OMP (Defence, 2020) and SAQP (AECOM, 2021a), the adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 7** below.

Table 7 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values are from the PFAS NEMP (HEPA, 2020). *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values are from NHMRC (2019). *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (95% species protection values)	PFOS	0.13 µg/L	*The values are from the PFAS NEMP* (HEPA, 2020). *All surface water and groundwater results will be compared to these criteria.*
	PFOA	220 µg/L	
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	
	PFOA	19 µg/L	

There are no current HEPA (2020) endorsed human health or ecological guideline values available for PFAS in sediment.

3.5 Data Quality Objectives and Data Validation

The data quality objectives and data quality indicators adopted for these works are presented in the SAQP (AECOM, 2021a).

Data validation assessment is provided in **Appendix C**.

Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (Defence, 2018) Annex L Guidance on Data Management (amended 2019) requirements.

3.6 Deviations from the SAQP

Table 8 lists the deviations from the SAQP (AECOM, 2021a) during this sampling event.

Table 8 Deviations from the SAQP during sampling event for March/April 2021

SAQP	March / April 2021 Sampling Event
Collection of groundwater samples at 46 locations	• Groundwater samples were not collected from four monitoring wells MW056, MW015, MW039, MW040, as they have been destroyed. • Groundwater samples were not collected from two monitoring wells MW008 and MW009 as they were damaged. • Groundwater samples were not collected from two monitoring wells, MW041 and MW049 as they could not be located due to the presence of long grass and a fallen tree at MW049.
Collection of co-located surface water and sediment samples at 49 locations	• A sample was not collected from SW048 that was dry.
Collection of groundwater samples from monitoring wells using no-purge HydraSleeves™	• The groundwater sample from monitoring well MW054S was collected via a grab sample using a decontaminated bailer due to insufficient water column for HydraSleeve sampling.

4.0 Field Observations and Results

The March / April 2021 sampling event was completed on 30 March, 12-16 April and 19 – 21 April 2021. The results are summarised in following sections.

4.1 Groundwater

4.1.1 Groundwater Observations and Field Measurements

Table 9 Groundwater Observations and Field Measurements

Item	Details
Access	All monitoring wells were accessible except for the following: • On-Site monitoring wells MW015, MW039, MW040 and MW056 have been destroyed and could not be sampled. • On-Site monitoring wells MW008 and MW009 are damaged and were unable to be sampled. • On-Site wells MW041 and MW049 could not be located due to the presence of long grass and a fallen tree at MW049. The groundwater sample from off-Site monitoring well MW054S was collected via a grab sample using a disposable single use HDPE ecobailer due to insufficient water column for HydraSleeve sampling.
Monitoring Well Network	The following five on-Site monitoring wells were noted to be damaged during the fieldworks: MW021 – gatic is cracked. The well was able to be sampled. MW031 – The ground surrounding the well has subsided causing the monument to sink. As a result, the lid cannot be closed. The well was able to be sampled. MW042 – The gatic concrete collar and lid were cracked and broken. The well was able to be sampled. MW047 – The gatic concrete collar was cracked and broken. The well was able to be sampled. MW050 – The gatic concrete collar, lid, and casing on MW050 were cracked and broken. The well was able to be sampled.
Field Observations	Groundwater from four monitoring wells had a sulphur odour (MW042, MW043, MW046 and MW056I). Groundwater from five monitoring wells had an organic odour (MW022, MW033, MW047, MW054D, MW057S). No other visible or olfactory indications of contamination were observed during the sampling of the other monitoring wells. Field observations are presented in **Table T1** in **Appendix B**.
Depth to Groundwater	Depth to groundwater in the Alluvium was between 3.745 and 15.604 metres below top of casing (mbtoc). Depth to groundwater in the Tertiary Formation was between 6.503 and 15.862 mbtoc. Depth to groundwater in the Walloon Coal Measures was between 6.311 and 24.257 mbtoc. Groundwater elevations in the Alluvium were between 8.143 and 17.738 mAHD. Groundwater elevations in the Tertiary Formation were between 5.164 and 28.726 mAHD. Groundwater elevations in the Walloon Coal Measures were between 15.481 and 34.562 mAHD. Groundwater gauging data are presented in **Table T1** in **Appendix B**. Water level transducer results for seven monitoring wells are presented in **Appendix G**.

4.1.2 Groundwater Analytical Results

The groundwater analytical results for PFAS from this sampling event are presented in **Table T2** in **Appendix B**. There were two first-time exceedances of the human health drinking water guideline value. The concentration of sum of PFHxS and PFOS in the sample from MW050 was 0.18 µg/L and the concentration of PFOA in the sample from MW022 was equal to the guideline value (0.56 µg/L). There were three first time detections of sum of PFHxS and PFOS in groundwater samples from MW002, MW012 and MW024. These are recorded in **Table 10** below and are displayed in **Figure 5, Appendix A**.

Concentrations of sum of PFHxS and PFOS in 20 of the 38 groundwater samples exceeded the drinking water guideline value with eight samples exceeding the PFOA guideline. All 29 groundwater samples that exceeded the limit of reporting exceeded the ecological guideline for PFOS for 99% protection of ecosystems with 16 of these samples also exceeding the 95% protection guideline value. The three samples with first-time detections of PFOS (MW002, MW012 and MW024) were also first-time exceedances of the ecological guideline for PFOS for 99% protection of freshwater ecosystems.

One groundwater sample exceeded the PFOA ecological guideline for 99% protection of freshwater species but this sample did not exceed the 95% protection guideline.

Table 10 First-time detections or exceedances of sum of PFHxS and PFOS or PFOA in groundwater

First time detection / exceedance	Ground-water Sampling location	Sum of PFHxS+PFOS concentration (µg/L)		PFOA concentration (µg/L)	
		March / April 2021	Historical maximum	March / April 2021	Historical maximum
First time detections of PFHxS+PFOS or PFOA in groundwater	MW002	0.02	<0.05	<0.01	<0.01
	MW012	0.01	<0.05	<0.01	<0.01
	MW024	0.04	<0.01	<0.01	<0.01
First time exceedance of human health drinking water guideline value	MW022	18.1	31.9	0.56	0.35
	MW050	0.30	0.02	<0.01	<0.01

Note: Blue shading indicates a sample with a first-time detection of PFOS+PFHxS or PFOA
Yellow shading indicates a sample with a first-time exceedance above human health drinking water guideline values (refer to Table 7).

4.2 Surface Water

4.2.1 Surface Water Observations and Field Measurements

Table 11 Surface Water Observations and Field Measurements

Item	Details
Access	All surface water sampling locations were accessed during the sampling event, with the exception of SW048 that was dry. SW048 is a drain sampling location.
Field Observations	Eight surface water samples had an organic odour: SW021, SW037, SW038, SW041, SW045, SW059, SW064 and SW079. Eight surface water samples had a sheen appearance: SW008, SW011, SW025, SW027, SW041, SW059, SW079 and SW080. No visual or olfactory indications contamination were observed during the sampling of the other surface water sampling locations. Field observations are reported in **Table T3**, **Appendix B**.

</table>

4.2.2 Surface Water Analytical Results

The analytical results for PFAS in surface water from this sampling event are presented in **Table T4** in **Appendix B**. There were no first-time detections of PFHxS+PFOS and PFOA or first-time exceedances of the adopted human health or ecological guidelines compared to the historical dataset.

Concentrations of sum of PFHxS and PFOS in 16 of the 48 surface water samples exceeded the recreational water guideline value with none of the samples exceeding the PFOA guideline. All 38 surface water samples that exceeded the limit of reporting exceeded the ecological guideline for PFOS for 99% protection of ecosystems with 20 of these samples also exceeding the 95% protection guideline value. None of the samples exceeded the PFOA ecological guidelines for either 95% or 99% protection of freshwater species.

4.3 Sediment

4.3.1 Sediment Observations and Field Measurements

Table 12 Sediment Observations

Item	Details
Access	All sediment sample locations were accessible.
Field Observations	Sediment logging data are presented in **Table T5** in **Appendix B**. No visible or olfactory indications of contamination were observed during sampling at the sediment sampling locations.
Weather Conditions	Weather conditions during groundwater sampling were generally hot and dry.
Estate Management Works or Training Activities	During the sampling event no notable estate works or training activities were observed in the vicinity of sampling locations.

4.3.2 Sediment Analytical Results

The analytical results for PFAS in sediment from this sampling event are presented in **Table T6** in **Appendix B**. First-time detections from the historical dataset are recorded in **Table 13** below. The result is displayed in **Figure 5, Appendix A**.

Table 13 First-time detections of sum of PFHxS or PFOA in sediment

First time detection / exceedance	Ground-water Sampling location	Sum of PFHxS+PFOS concentration (µg/L)		PFOA concentration (µg/L)	
		March / April 2021	Historical maximum	March / April 2021	Historical maximum
First time detections of PFHxS+PFOS or PFOA in sediment	SD009	0.0033	0.0052	0.0002	<0.0002
	SD020	0.0093	0.0077	0.0004	<0.0002
	SD038	0.001	No historical data	<0.0002	No historical data
	SD091	0.0016	<0.0002	<0.0002	<0.0002

Note: Blue shading indicates a sample with a first-time detection of PFOS+PFHxS or PFOA

5.0 Summary and Next Sampling Event

5.1 Summary of Monitoring Event

A groundwater, surface water and sediment monitoring event was completed within the RAAF Base Amberley Management Area between 30 March, 12-16 April and 19 – 21 April 2021. The program included sampling of groundwater from 46 monitoring wells and 49 co-located surface water and sediment sampling locations.

Table 14 summarises the findings of the March / April 2021 sampling event and the recommended actions.

Table 14 Summary of Sampling Event

Item	Comment	Recommended Actions
Access to sampling locations	A total of 38 out of the 46 monitoring wells were accessible. Four on-Site wells (MW015, MW039, MW040, MW056) have been destroyed during construction of new infrastructure. Two on-Site wells were damaged and could not be sampled (MW008 and MW009). Two on-Site wells (MW041 and MW049) could not be located due to long grass and a fallen tree. The loss of these monitoring wells has the potential to impact the understanding of the distribution of PFAS in groundwater. All surface water sampling locations were accessed during the sampling event with the exception of one on-Site drain sampling location (SW048) which was dry. All sediment sampling locations were accessible.	The interpretative report (AECOM, 2021b) has recommended the installation of five new monitoring wells to replace destroyed/damaged wells. Sampling of on-Site drains should continue to be timed to occur after a rainfall event.
Monitoring well network condition	No issues were identified in 33 out of the 38 monitoring wells sampled. Slight damage was observed to five monitoring wells: • MW021 – gatic is cracked. • MW031 – The ground surrounding the well has subsided causing the monument to sink. As a result, the lid cannot be closed. The well was able to be sampled. • MW042 – The gatic concrete collar and lid were cracked and broken. The well was able to be sampled. • MW047 – The gatic concrete collar was cracked and broken. The well was able to be sampled. • MW050 – The gatic concrete collar, lid, and casing was cracked and broken. The well was able to be sampled.	Minor repairs are required to these monitoring wells, which should be addressed during the drilling of the replacement wells.

Item	Comment	Recommended Actions
Analytical Results	PFAS concentrations in 34 of the 38 groundwater samples were consistent with historical results. PFAS concentrations in all 48 surface water samples collected were consistent with historical results. PFAS concentrations in 48 of the 49 sediment samples were consistent with historical results.	Ongoing monitoring in accordance with the OMP.
First-time detections of Sum of PFHxS and PFOS or PFOA	Three first time detections of PFAS above the laboratory limit of reporting were recorded in groundwater samples from MW002, MW012 and MW024 at concentrations slightly above the laboratory limit of reporting. No first-time detections of PFAS above the laboratory limit of reporting were recorded in any of the surface water samples collected. Two of the 49 sediment samples recorded a first-time detection of PFOA (SD009 and SD020) and two sediment samples recorded first-time detections of sum of PFHxS and PFOS (SD038 and SD091). Results were reported at concentrations slightly above the limit of reporting.	Ongoing monitoring in accordance with the OMP.
First time exceedance of NEMP drinking water guideline values	Two groundwater samples reported first-time exceedances: • The concentration of sum of PFHxS and PFOS in MW050 (0.30 ug/L) exceeded the NEMP (HEPA, 2020) drinking water guideline value (0.07 µg/L) • The concentration of PFOA in MW022 (0.56 µg/L) was equal to the guideline value. However, sum of PFHxS and PFOS concentrations in this well have consistently exceeded the drinking water guideline value.	Ongoing monitoring in accordance with the OMP.

5.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for October 2021.

5.3 Upcoming Annual Interpretive Report

The next annual interpretative report is scheduled to commence in January 2022.

mbtoc - metres below top of casing
mAHD - metres above Australian Height Datum
TOC - top of casing
DO - Dissolved Oxygen
EC - Electrical Conductivity
Er - Uncorrected Oxidation Reduction Potential
Eh - Corrected Oxidation Reduction Potential
` - no data
Er converted to Eh by adding 205 based on a YSI with Ag/AgCl sensor calibrated to a 3.5 molar KCL solution
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolts
°C - degrees Celcius

LOR is limit of reporting
µg/L is micrograms per litre
'-' denotes no analysis undertaken
'<' denotes concentration is less than
NEMP is National Environmental Mangement Plan
NHMRC is National Health Medical Research Council
Denotes first time detection above LOR
Denotes new exceedance of human health guideline values

DO - Dissolved Oxygen
EC - Electrical Conductivity
Er - Uncorrected Oxidation Reduction Potential
Eh - Corrected Oxidation Reduction Potential
` - no data
Er converted to Eh by adding 205 based on a YSI with Ag/AgCl sensor calibrated to a 3.5 molar KCL solution
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolts
°C - degrees Celcius

NEMP is National Environmental Mangement Plan
NHMRC is National Health Medical Research Council
Denotes first time detection above LOR
Denotes new exceedance of human health guideline values

Property ID	Location ID	Sample Date	Sample Description	Odour
0861	SD002	30/03/2021	Silty CLAY, brown/grey, very moist, high plasticity, firm, with medium-coarse grained sand and organic matter.	No odour
0861	SD003	30/03/2021	Silty CLAY, brown, moist, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD004	14/04/2021	Clayey SAND, brown, wet, soft, fine-coarse grained, with medium-coarse sub-angular gravels, trace of organic matter.	No odour
0861	SD005	12/04/2021	Silty CAND, brown, moist, fine-coarse grained, with roots and organic matter.	No odour
0861	SD008	15/04/2021	CLAY, brown, wet, medium plasticity, soft, trace of fine grained sand.	No odour
0861	SD009	14/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter and coarse grained sand.	No odour
0861	SD011	30/03/2021	Silty CLAY, brown, moist, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD015	12/04/2021	Silty CLAY, dark brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD016	12/04/2021	Silty CLAY, dark brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD018	12/04/2021	Silty CLAY, brown, wet, medium plasticity, with roots and organic matter.	No odour
0861	SD020	12/04/2021	Silty CLAY, brown, wet, medium plasticity, with roots and organic matter.	No odour
0861	SD021	30/03/2021	Sandy GRAVEL, black, saturated, loose, medium-coarse angular gravels, coarse sand.	No odour
0861	SD025	21/04/2021	Clayey SAND, dark brown, wet, loose, medium-coarse grained, with organic matter.	No odour
0861	SD026	16/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD027	30/03/2021	Silty CLAY, brown, moist, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD028	12/04/2021	CLAY, grey, wet, medium plasticity, soft, with organic matter.	No odour
0861	SD030	30/03/2021	Silty CLAY, dark brown, slightly moist, medium plasticity, firm, with roots and organic matter.	No odour
0861	SD033	15/04/2021	Sandy CLAY, brown/grey, wet, high plasticity, soft, fine-medium grained sand, with roots and organic matter.	No odour
0861	SD034	12/04/2021	Silty CLAY, brown, wet, medium plasticity, with roots and organic matter.	No odour
0861	SD036	14/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with leaf litter, trace of sand.	No odour
0861	SD037	30/03/2021	Silty CLAY, brown, moist, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD038	30/03/2021	Silty CLAY, grey, wet, high plasticity, firm, intermixed grass roots.	No odour
0861	SD039	30/03/2021	Silty CLAY, brown, moist, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD040	15/04/2021	Clayey SAND, dark brown, wet, loose, medium-coarse grained, with organic matter.	No odour
0861	SD041	30/03/2021	Organic matter, roots/leaves, trace of Silty CLAY.	No odour
0861	SD043	15/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, trace of coarse grained sand, coarse-medium grained sub-angular gravels and organic matter.	No odour
0861	SD045	15/04/2021	Sandy CLAY, brown/grey, wet, high plasticity, soft, medium-coarse grained sand, with roots and organic matter.	No odour
0861	SD047	14/04/2021	Silty CLAY, grey, wet, medium plasticity, very soft, with organics.	No odour
0861	SD048	12/04/2021	Clayey SAND, dark brownh, moist, firm, fine to coarse grained, with organic matter.	No odour
0861	SD049	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter, trace of fine grained sand.	No odour
0861	SD050	14/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with leaf litter, trace of sand.	No odour
0861	SD051	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD052	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD053	19/04/2021	CLAY, dark brown/grey, moist, high plasticity, soft, with of fine-medium grained sand and organic matter.	No odour
0861	SD056	30/03/2021	Silty CLAY, dark grey, wet, low plasticity, soft, with organics.	No odour
0861	SD059	30/03/2021	Silty CLAY, brown, dry, low plasticity, firm, with organics.	No odour
0861	SD064	19/04/2021	CLAY, dark brown, wet, medium plasticity, soft, trace of fine grained sand and organic matter.	No odour
0861	SD067	19/04/2021	CLAY, dark brown, wet, medium plasticity, soft, with fine-medium grained angular gravels, trace of fine grained sand and organic matter.	No odour
0861	SD076	30/03/2021	SAND, dark brown, wet, loose, coarse grained,	No odour
0861	SD079	19/04/2021	CLAY, dark brown/grey, moist, high plasticity, soft, trace of fine grained sand and organic matter.	No odour
0861	SD080	19/04/2021	CLAY, dark brown/grey, moist, high plasticity, soft, trace of fine-medium grained sand and organic matter.	No odour
0861	SD088	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD089	13/04/2021	Silty CLAY, grey-brown, orange-brown mottle, dry, medium plasticity, hard, with organics.	No odour
0861	SD090	14/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with leaf litter.	No odour
0861	SD091	14/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with leaf litter, trace of sand.	No odour
0861	SD094	14/04/2021	Clayey SAND, brown, wet, loose, coarse grained.	No odour
0861	SD098	15/04/2021	CLAY, brown, medium plasticity, soft, trace of fine grained sand and organic matter.	No odour
0861	SD099	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour
0861	SD100	13/04/2021	Silty CLAY, brown, wet, medium plasticity, soft, with roots and organic matter.	No odour

LOR is limit of reporting
mg/kg is milligrams per kilogram
µg/kg is micrograms per kilogram
'-' denotes no analysis undertaken
'<' denotes concentration is less than
Denotes first time detection above LOR

Analytical Data Validation

Appendix C Analytical Data Validation

DATA VALIDATION REPORT

Project No.:	60612563	**Validation by:** CM		**Date:**	26/05/2021
Client:	Department of Defence				
Site:	Royal Australian Airforce Base, Amberley				
Matrix type:	Groundwater, surface water, sediment	**Data verified by:** FL		**Date:**	10/06/2021
No. of primary samples:	38 groundwater, 48 surface water, 49 sediment				
Laboratory:	ALS (Brisbane), NMI (Sydney)	**Project Manager:** JP			
Lab reference:	EB2108857; EB2111111; EB2111112; EB2111116; EB2111121; AECO06_210407; AECO06_210428_1				

Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication on data interpretation and therefore decision-making on the project. The data are considered appropriate for use to meet the project objectives.

Field QA/QC

Sampling personnel	Sampling was conducted by Camden McCosker, Bianca Burke and Mary MacElroy on 30 March, 12-16 April and 19 – 21 April 2021.
Sampling Methodology	Samples were collected using appropriate methods as identified within the main body of the report and as presented in the SAQP.
Chain of Custody (COC)	COC documents completed as per AECOM procedures.
Rinsate Blank	Rinsate blank samples were collected at a frequency of one per day of sampling where appropriate (eight in total). Rinsates were collected from the decontaminated interface probe or the water quality meter. On days where dedicated sampling equipment was used to obtain samples (e.g. hydrasleeves were being collected) no rinsates samples were required. Concentrations reported below the LOR for all analytes tested. See Table C4.
Field Blanks	Field blank samples were collected at a frequency of one per day of sampling (nine in total) by filling sample containers with laboratory supplied deionised water in the field. All field blanks reported concentrations below the LOR for the analytes tested. See Table C4.
Trip Blanks	Trip blank samples were present during the transport of samples during the sampling between 30 March, 12-16 April and 19 – 21 April 2021. Four water trip blanks and three soil trip blanks all reported concentrations below the LOR, see Table C5.
Frequency of field QC	Field duplicate (inter-laboratory duplicates) and triplicates (inter-laboratory duplicates) were collected. Ten duplicates/triplicate sets for groundwater and surface water (see Tables C1 and C2) and six duplicate/triplicate sets for sediment. The frequency of field QC achieves the expected frequency for each media type. The target frequency of one in ten primary samples was achieved for all matrices.
Handling and preservation	Primary, duplicate and triplicate samples were received preserved and chilled at the laboratory. All samples were received at the laboratory in appropriate sample containers with no sample container non-compliances noted.

Laboratory QA/QC

Tests requested/reported	Samples were analysed and reported as requested on the COC.

Holding time compliance	Samples were extracted and analysed within recommended holding times, except: • EB2111116 – moisture content in SD048; SD015; SD018; SD020; SD005; SD016; SD034 and SD028 (1 day overdue) • EB2111121 – moisture content in QC140 (1 day overdue) The holding time non-compliances are not expected to impact data quality. All PFAS analyses (the key contaminant) were analysed within the minimum hold times.
Laboratory Accreditation	The laboratory analysis was conducted by ALS Environmental Pty Ltd (Brisbane) a National Association of Testing Authorities (NATA) accredited laboratory. The triplicate samples were analysed at the National Measurement Institute (Sydney), also a NATA accredited laboratory.

Frequency of laboratory QC	The laboratory reported a sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision, except:
	• Matrix spikes and laboratory duplicates for PFAS (both 0.00%) which is below the expected rate of 5.0% (for matrix spikes) and 10.00% (duplicates) in the following batches:
	  • EB2111111 (20 samples in batch)
	  • EB2111112 (20 samples in batch)
	• Laboratory duplicates (water) for PFAS (5.26%) which is below the expected rate of 10.00% in EB2108857 (19 samples in batch)
	• Matrix spikes and laboratory duplicates for PFAS (with rates of 3.0% and 4.00%) which are below the expected rate of 10.00% and 5.0% respectively in EB2111121 (100 samples in batch)
	
	The reason for insufficient matrix spikes and laboratory duplicates is unknown as the laboratory was provided with sufficient sample volume, however as all other QC results met control limits this is not expected to impact data quality.

Method Blank	No method blank non-compliances were reported.
Laboratory duplicate RPDs	Laboratory duplicate Relative Percentage Differences (RPD) were within control limits for all samples except: • EB2111121, RPDs exceeded the LOR based limits in sample 0861_QC146_210419 (PFOS); • EB2111116, RPDs exceeded the LOR based limits in sample 0861_SD048_210412 (PFHxS, PFOS and PFDS) The reason given by the lab for these RPD exceedances is “Lab QC failed”.
Laboratory control spike recovery	No non-compliances were reported for Laboratory Control Spikes (LCS).
Matrix spike recovery	All matrix spike (MS) recoveries (where reported) were within control limits, except: • EB2108857: MS recovery for PFOS in 0861_QC138_210330 was not determined as the background level was greater or equal to 4x spike level. • EB2111112: MS recovery for PFOS in sample 0861_SD098_210415 was not determined as the background level was greater or equal to 4x spike level • EB2111116: MS recovery for PFOS in samples 0861_SD005_210412 and anonymous sample were not determined as the background level was greater or equal to 4x spike level. The date indicate that matrix interference has occurred in some samples. These non-conformances are not expected to impact data quality.
Surrogate spike recovery	Surrogate spike recoveries were within control limits for all samples.
QA/QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.

Data transcription	A random 10% check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted screening levels except for PFOS for NEMP (HEPA, 2020) ecological guideline values for the 99% protection of freshwater species. The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR. This should be taken into consideration when interpreting and using this data quantitatively where results are reported below LOR.
Field QAQC RPDs	RPDs for groundwater surface water and sediment samples are reported in Tables C1, C2 and C3 respectively. Field duplicate and triplicate RPDs were reported within control limits for all groundwater, surface water and sediment samples except the following (the sample with the higher concentration is in bold). • **0861_MW034_210419** and 0861_QC147_210419 for PFOS (193%) • **0861_MW034_210419** and 0861_QC247_210419 for PFOS (187%) • **0861_MW047_210420** and 0861_QC148_210420 for PFBS (103%) • **0861_MW047_210420** and 0861_QC148_210420 for PFHxA (143%) • **0861_MW047_210420** and 0861_QC148_210420 for PFPeS (130%) • **0861_MW047_210420** and 0861_QC148_210420 for PFPeA (145%) • **0861_MW047_210420** and 0861_QC148_210420 for PFOS (139%) • **0861_MW047_210420** and 0861_QC248_210420 for PFOS (31%) • **0861_MW047_210420** and 0861_QC248_210420 for PFHxS (139%) • **0861_MW032_210421** and 0861_QC249_210421 for PFHpS (51%) • **0861_MW032_210421** and 0861_QC249_210421 for PFHpA (39%) • **0861_MW032_210421** and 0861_QC249_210421 for PFHxA (55%) • **0861_MW032_210421** and 0861_QC249_210421 for PFPeS (35%) • **0861_MW032_210421** and 0861_QC249_210421 for PFOS (56%) • **0861_MW032_210421** and 0861_QC249_210421 for PFHxS (38%) • **0861_SW037_210330** and 0861_QC239_210330 for PFOS (108%) • **0861_SW037_210330** and 0861_QC239_210330 for PFOA (32%) • **0861_SW037_210330** and 0861_QC239_210330 for PFHxS (51%) • **0861_SW079_210419** and 0861_QC245_210419 for PFHpS (70%) • **0861_SW079_210419** and 0861_QC245_210419 for PFHpA (38%) • **0861_SW079_210419** and 0861_QC245_210419 for PFHxA (48%) • **0861_SW079_210419** and 0861_QC245_210419 for PFPeS (74%) • **0861_SW079_210419** and 0861_QC245_210419 for PFPeA (37%) • **0861_SW079_210419** and 0861_QC245_210419 for PFOS (68%) • **0861_SW079_210419** and 0861_QC245_210419 for PFOA (39%) • **0861_SW079_210419** and 0861_QC245_210419 for PFHxS (31%) • 0861_SD037_210330 and **0861_QC240_210330** for PFDoDA (86%) • 0861_SD030_210330 and **0861_QC138_210330** for PFDoDA (55%) • 0861_SD030_210330 and **0861_QC238_210330** for PFDoDA (88%) • 0861_SD030_210330 and **0861_QC238_210330** for PFHxS (37%) • 0861_SD079_210419 and **0861_QC146_210419** for PFBS (64%) • 0861_SD079_210419 and **0861_QC146_210419** for PFDS (133%) • 0861_SD079_210419 and **0861_QC146_210419** for PFDoDA (90%) • 0861_SD079_210419 and **0861_QC146_210419** for PFHpS (117%) • 0861_SD079_210419 and **0861_QC146_210419** for PFHxA (65%) • 0861_SD079_210419 and **0861_QC146_210419** for PFUnDA (67%) • 0861_SD079_210419 and **0861_QC146_210419** for PFOS (91%) • 0861_SD079_210419 and **0861_QC146_210419** for PFOA (97%) • 0861_SD079_210419 and **0861_QC146_210419** for PFHxS (98%) • **0861_SD079_210419** and 0861_QC246_210419 for PFHxA (72%) • **0861_SD048_210412** and 0861_QC140_210412 for PFHpS (103%) • 0861_SD048_210412 and **0861_QC140_210412** for PFTrDA (59%) • **0861_SD048_210412** and 0861_QC140_210412 for PFOS (135%) • **0861_SD048_210412** and 0861_QC140_210412 for PFHxS (43%) • **0861_SD048_210412** and 0861_QC240_210412 for PFDS (125%)

- **0861_SD048_210412** and 0861_QC240_210412 for PFHpS (95%)
- **0861_SD048_210412** and 0861_QC240_210412 for PFOS (157%)
- **0861_SD048_210412** and 0861_QC240_210412 for PFHxS (90%)
- 0861_SD036_210414 and **0861_QC143_210414** for PFDS (177%)
- 0861_SD036_210414 and **0861_QC143_210414** for PFOS (41%)

The majority of the higher RPDs for groundwater, surface water and sediment are for the triplicate samples. The RPD results are not considered to impact the interpretation for this investigation but do demonstrate that there are differences in laboratory analysis and extraction methods in groundwater, surface water and sediment samples. Many of the RPDs are related to low detected concentrations or near the limit of reporting. It is noted that the QC samples results were within the same order of magnitude as the primary sample.

The elevated RPDs for the sediment samples is also attributed to sample heterogeneity.

All remaining samples reported within the control limits.

Other	
Other observations	None.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.

**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: no limit (<10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

NC is not calculable

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: no limit (<10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory
NC is not calculable

Dates

Date Samples Received	: 31-Mar-2021 11:10	Issue Date	: 01-Apr-2021
Client Requested Due Date	: 12-Apr-2021	Scheduled Reporting Date	: **12-Apr-2021**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 2.9°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 33 / 33

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- ***SRN Reissued 01/04/2021: As per the email from Camden McCosker 01/04/2021, the sample ID of ALS #33 has been changed to "0861_QC138_210330".***
- Please be advised that unlabelled sample container received has been allocated to 0861_SD037_210330 where no marked container was received for this sample. This is as per phone directive C. McCOSKER 01/04/2021 9:30am
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **An extra sample was received labelled as "0861_SD138_210330" and has been assigned analysis as per phone directive** [redacted]
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- **Samples QC237, QC2238, QC239 & QC240 have been forwarded to NMI, as requested. Please note that this will incur a freight forwarding fee.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Particular samples required dilution prior to extraction due to matrix interferences. LOR values have been adjusted accordingly and surrogate recoveries not determined.
- EP231X PFAS: The LOR of particular analytes for sample “0861_SD039_210330” have been raised due to sample matrix interferences.
- EP231X PFAS: Matrix spike recovery not determined due to dilution of primary sample.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **EB2108857**	Page	: 1 of 13
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: PO BOX 1307 FORTITUDE VALLEY QLD, AUSTRALIA 4006	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 31-Mar-2021
Order number	: 60612563 3.1	Date Analysis Commenced	: 01-Apr-2021
C-O-C number	: ----	Issue Date	: 12-Apr-2021
Sampler	: ----		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 33		
No. of samples analysed	: 33		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Acid Sulfate Soil Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2108857**	Page	: 1 of 7
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 31-Mar-2021
Site	: ----	Issue Date	: 12-Apr-2021
Sampler	: ----	No. of samples received	: 33
Order number	: 60612563 3.1	No. of samples analysed	: 33

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries

Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	19	5.26	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LORs for PFBS and PFBA for sample '0861_MW054S_210421' have been raised due to matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2111111**	Page	: 1 of 4
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Site	: ----	Issue Date	: 04-May-2021
Sampler	: [redacted]	No. of samples received	: 2
Order number	: 60612563 3.1	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	20	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	20	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (DD/MM/YYYY): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Serena Thomas on 11/05/21, for samples 3 and 9. All analysis results are as per the previous report.
- EP231X PFAS: The LORs of particular analytes have been raised for particular samples due to matrix interferences.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Contact	: [redacted]	Contact	: [redacted]
Address	: BRISBANE	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Order number	: 60612563 3.1	Date Analysis Commenced	: 27-Apr-2021
C-O-C number	: ----	Issue Date	: 11-May-2021
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2111112**	Page	: 1 of 7
Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Site	: ----	Issue Date	: 11-May-2021
Sampler	: [redacted]	No. of samples received	: 16
Order number	: 60612563 3.1	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EB2111112--012	0861_SD098_210415	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	20	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	20	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders (EB2111121, EB2111116) due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on ALSEnviro.Brisbane@alsglobal.com**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **SOIL**

[redacted]	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders (EB2111121, EB2111116) due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on ALSEnviro.Brisbane@alsglobal.com**
- EP231X PFAS: Sample "0861_SD048_210412" shows poor duplicate results due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP231X PFAS: The LOR of particular analytes have been raised due to sample matrix interferences.
- EP231X PFAS: Particular samples required dilution due to sample matrix. LOR values have been adjusted accordingly and matrix spike recovery not determined.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **EB2111116**	Page	: 1 of 11
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: BRISBANE	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Order number	: 60612563 3.1	Date Analysis Commenced	: 27-Apr-2021
C-O-C number	: ----	Issue Date	: 05-May-2021
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 30		
No. of samples analysed	: 30		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
[redacted]	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2111116**	Page	: 1 of 7
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Site	: ----	Issue Date	: 05-May-2021
Sampler	: [redacted]	No. of samples received	: 30
Order number	: 60612563 3.1	No. of samples analysed	: 30

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders (EB2111116, EB2111121) due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on** [redacted]
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **EB2111121**	Page	: 1 of 45
Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: BRISBANE	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021 13:55
Order number	: 60612563 3.1	Date Analysis Commenced	: 27-Apr-2021
C-O-C number	: ----	Issue Date	: 25-May-2021 10:12
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 93		
No. of samples analysed	: 93		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LOR for PFBS has been raised for sample '0861_QC147_210419' due to matrix interference.
- EP231X PFAS: Sample 0861_QC146_210419 shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders (EB2111116, EB2111121) due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on ALSEnviro.Brisbane@alsglobal.com**
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Samples '0861_MW046_210421' and '0861_QC146_210419' required dilution prior to analysis due to matrix interferences. LOR values have been adjusted accordingly. The LORs for PFHpA and FOSA have been raised further due to matrix interference for sample '0861_QC146_210419'.
- Amendment 1 (25/05/2021): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Camden McCosker on 24/05/21. All analysis results are as per the previous report.
- EP231X PFAS: Particular samples required dilution due to matrix interference. LOR values have been adjusted accordingly and Surrogate recovery has not been determined.
- EP231X PFAS: The LOR of particular analytes for samples '0861_QC147_210419', '0861_MW030_210413' and '0861_MW055S_210416' have been raised due to sample matrix interferences.
- EP231X-INJ PFAS by LCMSMS: Sample '0861_MW044_210421' has been tested to the legacy QSM 5.1 aligned, NATA accredited method due to sample matrix being unsuitable for SPE extraction (high sediment content).
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

Analytical Results

Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: BRISBANE	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Order number	: 60612563 3.1	Date Analysis Commenced	: 27-Apr-2021
C-O-C number	: ----	Issue Date	: 25-May-2021
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 93		
No. of samples analysed	: 93		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2111121**	Page	: 1 of 16
Amendment	: **1**		
Client	: **AECOM Australia Pty Ltd**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: QLD_0861_PFASOMP	Date Samples Received	: 22-Apr-2021
Site	: ----	Issue Date	: 25-May-2021
Sampler	: [redacted]	No. of samples received	: 93
Order number	: 60612563 3.1	No. of samples analysed	: 93

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs

Quality Control Sample Type / Method	Count: QC	Count: Regular	Rate (%): Actual	Rate (%): Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	4	100	4.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	3	100	3.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIVED CONDITION

Date samples received:	7-APR-2021
Sample received in good order:	Yes
NMI Quotation no. provided:	QLD_0861_PFASOMP
Client purchase order number:	60612563_3_1
Temperature of samples:	Chilled
Comments:	
Mode of Delivery:	Courier

Additional Terms and Conditions

Incomplete / unclear information about samples or required testing will delay the start of the analysis work

If you require your Purchase Order (PO) number to be included on our invoice, please provide the number during sample submission and before the completion of work to avoid unnecessary delays and/or additional processing/handling fees.

The lodgement of an order or receipt of samples for NMI services referenced in this Sample Receipt Notification constitutes an acceptence of the current version of NMI Terms and Conditions or other applicable Terms referenced in the NMI Quotation. NMI Terms and Conditions are available on the web at https://www.industry.gov.au/client-services/testing-and-analysis-services/chemical-and-biological-analysis-services-terms-and-conditions

PFOS and PFHxS are quantified using a combined branched and linear standard,

linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

SAMPLE RECEIVED CONDITION

Date samples received:	28-APR-2021
Sample received in good order:	Yes
NMI Quotation no. provided:	
Client purchase order number:	60612563_3_1
Temperature of samples:	Chilled
Comments:	ALL OK
Mode of Delivery:	Courier

Additional Terms and Conditions

Incomplete / unclear information about samples or required testing will delay the start of the analysis work

If you require your Purchase Order (PO) number to be included on our invoice, please provide the number during sample submission and before the completion of work to avoid unnecessary delays and/or additional processing/handling fees.

The lodgement of an order or receipt of samples for NMI services referenced in this Sample Receipt Notification constitutes an acceptence of the current version of NMI Terms and Conditions or other applicable Terms referenced in the NMI Quotation. NMI Terms and Conditions are available on the web at https://www.industry.gov.au/client-services/testing-and-analysis-services/chemical-and-biological-analysis-services-terms-and-conditions

REPORT OF ANALYSIS

PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.ô
Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N >10.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Program (OMP) (Defence, 2020) at the Royal Australian Airforce (RAAF) Base Amberley (the 'Site') and the Management Area in the South Queensland Region. The locations of the Site and Management Area are shown on **Figure 1** in **Appendix A**.

The OMP for RAAF Base Amberley (Defence, 2020) includes the following sampling events:

- Biannual groundwater, surface water and sediment sampling in April and October in 2020, 2021, and 2022.

Following each biannual sampling event, sampling event factual reports will be prepared. Annual interpretative reports will be prepared following the completion of each 12-month sampling period. This sampling event factual report has been prepared to report the results of the biannual sampling event completed in October 2021, specifically highlighting first time detections and/or first-time exceedances of human health screening criteria for PFHxS+PFOS and / or PFOA.

This report has been prepared in accordance with the *PFAS OMP Factual Reports Guidance,* v 0.2, May 2021 (Defence, 2021).

1.2 Objectives

The objectives of the OMP are to:

- Implement the OMP prepared as part of the PFAS Management Area Plan (PMAP); and
- Collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration and transport of PFAS at each property.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

The objective of this phase of works was to implement the scope of works for the October 2021 sampling event in accordance with the sampling analysis and quality plan (SAQP) (AECOM, 2021a).

2.0 Scope of Work

The sampling event at RAAF Base Amberley was completed in general accordance with the SAQP (AECOM, 2021a). In summary, the scope of works for this sampling event included:

- Obtaining access to private properties where some groundwater sampling locations are situated.
- Review of the SAQP prior to the monitoring event to ensure compliance with the following:
  - PFAS National Environmental Management Plan (NEMP) (HEPA, 2020)
  - National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013)
  - Defence Routine Environment Water Quality Monitoring Manual
  - AS/NZ 5667:1998 Water quality – Sampling
  - Australian and New Zealand Guidelines for Fresh and Marine Water Quality; and
  - Relevant State regulatory guidelines.
- Gauging of groundwater elevation in all monitoring wells prior to collection of samples (refer to **Table 1** below, and **Figure 2** in **Appendix A** for specific locations).
- Collection of groundwater samples at 46 locations including 40 on-Site monitoring wells and six off-Site monitoring well locations. Details are included in **Table 1** below and **Figure 2** in **Appendix A**. Groundwater samples from six monitoring wells could not be collected during this sampling event. Refer to **Table 8** for more details.
- Collection of co-located surface water and sediment samples at 49 locations, including 42 on-Site locations, and seven off-Site locations (refer below to **Table 2** and **Table 3** and **Figure 3** in **Appendix A**). It is noted that one surface water sample could not be collected during this sampling event. Refer to **Table 8** for more details.
- Downloading groundwater level data from data loggers installed in seven groundwater monitoring wells (MW025, MW028, MW032, MW055S, MW055D, MW056S, MW056I), refer to **Figure 2** in **Appendix A** for data logger locations.
- Collection of intra- and inter- laboratory duplicate samples at a rate of 1 in 10 primary samples, one field blank sample per day, one rinsate sample per fieldwork day and one trip blank per batch.
- Analysis of all samples for the PFAS suite at the standard limit of reporting (LOR).
- Data management of all OMP field and laboratory data in the Defence ESdat database.
- Preparation of results letters for off-Site stakeholders.
- Preparation of this Sampling Event Factual Report.

Table 1 Groundwater Sampling Locations

Location		Monitoring Wells
Source Areas	Former Topside Aviation Fire Training Area (FTA) and current FTA Fire Pad (Confirmed Primary Source Area [CPSA] A)	MW002, MW008, MW009, MW033, MW039, MW040
	B Hangar 410 and Former Landfill	MW047
	Frogs Hollow Former Fire Training School Location (CPSA B)	MW037
	Sewage Treatment Plant (CPSA D)	MW021, MW032
	Historical Containment Pond (CPSA E)	MW048
	Former Fire Training Area and Operational Testing Area (CPSA G)	MW050
	Former Fire Training Area and Operational Testing Area (CPSA J)	MW005
	Potential Former Fire Training Area and Operations Test Area (CPSA L)	MW006, MW023, MW028, MW029, MW036
	Former Fuel Farm 1 and Triple Interceptor Pit (CPSA M)	MW056, MW309
	Potential Location of Aircraft F-4E Incident (CPSA T)	MW035
	AFFF Wastewater Holding Tank (CPSA V)	MW046
	Fire Fighting Training School (CPSA W)	MW026, MW030, WM031, MW042, MW043
	Former Structural and Open Pit Fire Training Area and Former Secondary Fire Training Area (CPSA X and Y)	MW015, MW041
	Fuel UST with AFFF listing (CPSA Z)	MW020
	Triple Interceptor Pits at Engine Test Cell Facilities 1 and 2 (CPSA AA)	MW007
	Areas used for irrigation – former grassed runways (CPSA BB)	MW012
	Former Landfill (CPSA CC)	MW022
	Former Fire Training Area on Disused Runway (CPSA DD)	MW049
Off-Site Warrill Creek		*MW054S, MW054D,* MW057S, MW057I
On-Site Bremer River		MW024, MW025, MW034, MW044, MW055S, MW055D
Off-Site Bremer River		MW056S, MW056I

Note: *Italics* indicates that the well is located on private property.
Wells with S, D or I are adjacent monitoring wells that are screened in different aquifers. 'S' indicates the well is screened in the shallow aquifer, 'D' or 'I' indicates the well is screened in the deeper aquifer. MW056I and MW057I were previously known as MW056D and MW057D.
MW002 was formerly known as MW2. MW056 was formerly known as MW002.

Table 2 Surface Water Sampling Locations

Area	Surface Water Sampling Locations	Number of Locations
On-Base Drains	SW002, SW003, SW008, SW011, SW021, SW027, SW028, SW030, SW033, SW037, SW038, SW041, SW048, SW049, SW053, SW056, SW059, SW064, SW067, SW076, SW079, SW080	22
Warrill Creek	SW004, SW005, SW009, SW015, SW016, SW018, SW020, SW026*, SW034, SW043*, SW099, SW100	12
Bremer River	SW025*, SW036, SW039*, SW040*, SW045*, SW047, SW050, SW051, SW052, SW088, SW089, SW090, SW091, SW094, SW098*	15

Note: * denotes off-Site sampling location.

Table 3 Sediment Sampling Locations

Area	Sediment Sampling Locations	Number of Locations
On-Base Drains	SD002, SD003, SD008, SD011, SD021, SD027, SD028, SD030, SD033, SD037, SD038, SD041, SD048, SD049, SD053, SD056, SD059, SD079, SD064, SD067, SD076, SD080	22
Warrill Creek	SD004, SD005, SD009, SD015, SD016, SD018, SD020, SD026*, SD034, SD043*, SD099, SD100	12
Bremer River	SD025*, SD036, SD039*, SD040*, SD045*, SD047, SD050, SD051, SD052, SD088, SD089, SD090, SD091, SD094, SD098*	15

Note: * denotes off-Site sampling location.

3.0 Methodology

The methodology used for the October 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised below. Deviations from the SAQP are discussed in **Section 3.6**.

3.1 Groundwater Sampling Methodology

The groundwater sampling methodology is outlined in **Table 4** below.

Table 4 Groundwater Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater was measured in each monitoring well using an interface probe prior to the installation of HydraSleeves™, or if HydraSleeves were already installed, prior to retrieval of the HydraSleeve. Gauging was conducted in as short a time as possible, however, due to the number of wells and different requirements for accessing the monitoring well locations, the gauging took place over several days. Water level transducers are installed in seven monitoring wells to continuously record groundwater levels. A barometric logger is installed in MW028. Data collected since the previous OMP sampling event in March / April 2021 was downloaded.
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality were recorded for all groundwater samples.
Sampling methodology	Groundwater samples were collected from the majority of monitoring wells using no-purge methodology HydraSleeves™, which were installed within the screened interval of each well (based on a review of the well construction log) for a minimum of 24 hours prior to the sampling round. Once sampling was completed, new HydraSleeves™ were deployed at the screened interval depth in 18 of the monitoring wells in preparation for the next sampling round. HydraSleeves were not installed in 21 monitoring wells as they are regularly used for monitoring on other programs. There was insufficient groundwater in two wells (MW048 and MW049) for HydraSleeve sampling. The groundwater sample was collected using a disposable single use HDPE ecobailer.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QA/QC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for analysis for the PFAS suite using the standard levels of detection. ALS Environmental (ALS) Brisbane, Queensland was used as the primary laboratory. The National Measurement Institute (NMI) of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses are certified by the National Association of Testing Authorities (NATA). Chain of custody (COC) forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.2 Surface Water Sampling Methodology

The methodology used for the October 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised in **Table 5** below.

Table 5 Surface Water Sampling Methodology

Item	Details
Field parameters	Temperature, electrical conductivity, dissolved oxygen, oxidation-reduction potential, pH and observations of water quality were recorded for all surface water samples.
Sample Collection Methodology	Samples were collected from immediately below the water surface to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container was lowered into the water with the cap immediately applied once the container was full.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QAQC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses were certified by the NATA. Chain of custody forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.3 Sediment Sampling Methodology

The methodology used for the October 2021 sampling event was in accordance with the SAQP (AECOM, 2021a) and is summarised in **Table 6** below.

Table 6 Sediment Sampling Methodology

Item	Details
Sample Collection Methodology	Samples representative of potentially deposited sediments were collected from within the water body where possible. Sediment samples were collected by hand using new laboratory supplied nitrile gloves and a new laboratory supplied container at each location.
Logging	Sediment characterisation were recorded for each sample.
QA/QC Samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. splits), field blanks, rinsate samples and trip blanks. Refer to **Appendix C** for assessment of QAQC sample data. Equipment calibration certificates are presented in **Appendix F**.
Sample analysis	All primary samples were submitted for PFAS suite using the standard levels of detection. ALS Brisbane, Queensland was used as the primary laboratory. NMI of Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for groundwater analyses were certified by the NATA. Chain of custody forms are presented in **Appendix D**, laboratory analytical certificates are presented in **Appendix E**.

3.4 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- PFAS NEMP, (HEPA, 2020)
- Department of Health, 2019. *Health Based Guidance Values for PFAS for use in site investigations in Australia,* September 2019
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water, August 2019 (NHMRC, 2019)
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013).

In accordance with the OMP (Defence, 2020) and SAQP (AECOM, 2021a), the adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 7** below.

Table 7 Summary of Adopted Screening Criteria

Pathway	Compound	Criteria	Comment / Reference
Human Health Receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	The values are from the PFAS NEMP (HEPA, 2020). *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values are from NHMRC (2019). *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	
Ecological Receptors			
Freshwater (95% species protection values)	PFOS	0.13 µg/L	*The values are from the PFAS NEMP* (HEPA, 2020). *All surface water and groundwater results will be compared to these criteria.*
	PFOA	220 µg/L	
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	
	PFOA	19 µg/L	

There are no current HEPA (2020) endorsed human health or ecological guideline values available for PFAS in sediment.

3.5 Data Quality Objectives and Data Validation

The data quality objectives and data quality indicators adopted for these works are presented in the SAQP (AECOM, 2021a).

Data validation assessment is provided in **Appendix C**. Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are

representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (Defence, 2018) Annex L Guidance on Data Management (amended 2019) requirements.

3.6 Deviations from the SAQP

Table 8 lists the deviations from the SAQP (AECOM, 2021a) during this sampling event.

Table 8 Deviations from the SAQP during sampling event for October 2021

SAQP	October 2021 Sampling Event
Collection of groundwater samples at 46 locations	• Groundwater samples were not collected from four monitoring wells MW056, MW015, MW039, MW040, as they have been destroyed during construction of new infrastructure. • Groundwater samples were not collected from two monitoring wells MW008 and MW009 as they were blocked or damaged preventing sampling equipment from being installed. There was an unidentified obstruction in MW008 and bent/broken casing at MW009. Monitoring wells MW056, MW008, MW009, MW039, MW040 were located close to and down-gradient of CPSA A (Former Topside Aviation FTA and current FTA pad), M (Fuel Farm 1) and N (Fire Station). Monitoring well MW015 was located close to the Former Structural and Open Pit FTA and Former Secondary FTA (CPSA X and Y). Due to the loss of these monitoring wells, the extent of PFAS in groundwater down-gradient of these CPSAs is not well defined.
Collection of surface water samples at 49 locations	• A sample was not collected from SW048 as this location was dry.
Collection of groundwater samples from monitoring wells using no-purge HydraSleeves™	• The groundwater sample from monitoring wells MW048 and MW049 were collected via a grab sample using a decontaminated bailer due to insufficient water column for HydraSleeve sampling.
Collection of groundwater quality parameter field measurements.	• Quality parameters for groundwater at MW031 were inadvertently not collected prior to sampling of the well.
Download of data from the datalogger in MW055D.	• Data could not be downloaded as the data logger appears to have malfunctioned and requires replacement.
Collection of field blanks each day of sampling.	• A field blank was collected each day of sampling during the sampling event between 19 and 28 October 2021. A field blank was inadvertently not collected during a resampling visit conducted on the 26 November 2021 to verify groundwater analytical results in two of the monitoring wells.

In addition, following review of the results, anomalies were noted for the groundwater samples from MW057S and MW057I (sampled on 22 October 2021) which had deviations from historical results. As it was considered likely that the samples had been inadvertently mislabelled during sample collection, the monitoring wells were resampled on 26 November 2021. The reported results were consistent with historical results and have superseded the results for the water samples collected on 22 October 2021.

4.0 Field Observations and Results

The October 2021 sampling event was completed between 19 and 28 October 2021 and 26 November 2021. Two wells were resampled on 26 November 2021 as described in **Section 3.6**. The results are summarised in following sections.

4.1 Groundwater

4.1.1 Groundwater Observations and Field Measurements

Table 9 Groundwater Observations and Field Measurements

Item	Details
Access	All monitoring wells were accessible except for the following: • On-Site monitoring wells MW015, MW039, MW040 and MW056 have been destroyed and could not be sampled. • On-Site monitoring wells MW008 and MW009 are blocked or damaged and were unable to be sampled.
Monitoring Well Network	The following five on-Site monitoring wells were noted to be damaged during the fieldworks: MW021 – gatic is cracked. The well was able to be sampled. MW031 – The ground surrounding the well has subsided causing the monument to sink. As a result, the lid cannot be closed. The well was able to be sampled. MW042 – The gatic concrete collar and lid had cracks. The well was able to be sampled. MW047 – The gatic concrete collar had cracks. The well was able to be sampled. MW050 – The gatic concrete collar, lid, and casing on MW050 had cracks. The well was able to be sampled.
Field Observations	Groundwater from four monitoring wells had a sulphur odour (MW042, MW046, MW047 and MW054D). Groundwater from four monitoring wells had an organic odour (MW056S, MW056I, MW057S, MW057I). No other visible or olfactory indications of contamination were observed during the sampling of the other monitoring wells. During the sampling of MW002 it was noted that the base of the well was clogged with a significant sediment load. Field observations are presented in **Table T1** in **Appendix B**.
Depth to Groundwater	Depth to groundwater in the Alluvium was between 3.84 and 15.62 metres below top of casing (mbtoc). Depth to groundwater in the Tertiary Formation was between 6.26 and 16.025 mbtoc. Depth to groundwater in the Walloon Coal Measures was between 6.27 and 24.255 mbtoc. Groundwater elevations in the Alluvium were between 8.275 and 17.787 mbtoc. Depth to groundwater in the Tertiary Formation was between 5.322 and 28.805 mbtoc. Depth to groundwater in the Walloon Coal Measures was between 15.566 and 36.362 mbtoc. Groundwater gauging data are presented in **Table T1** in **Appendix B**. Water level transducer results for seven monitoring wells are presented in **Appendix G**. The data logger in MW055D appears to have malfunctioned as the data could not be downloaded. The logger requires replacement.

<table>
<tr><th>Item</th><th>Details</th></tr>
<tr><td>Groundwater Flow Direction</td><td>Inferred groundwater contours and groundwater flow directions at the Site in October 2021 for the Alluvium/Tertiary Formation are shown on Figure 4 in Appendix A. The inferred local groundwater flow direction is towards the northeast and east in the direction of the Bremer River and Warrill Creek. The inferred flow direction is consistent with previous sampling events (AECOM, 2021b).</td></tr>
<tr><td>Groundwater Quality Parameter Field Measurements</td><td>Groundwater quality parameters were measured prior to collecting groundwater samples. The readings are presented in Table T1 in Appendix B and are summarised per geological unit in the table below:
<table>
<tr><th>Unit</th><th>Parameter</th><th>Min</th><th>Max</th><th>Comment</th></tr>
<tr><td rowspan="4">Alluvium</td><td>DO (mg/L)</td><td>0.43</td><td>2.4</td><td>Poor to moderately oxygenated</td></tr>
<tr><td>EC (µS/cm)</td><td>262.9</td><td>9,645</td><td>Fresh to brackish</td></tr>
<tr><td>pH</td><td>6.61</td><td>7.71</td><td>Near neutral to slightly alkaline</td></tr>
<tr><td>ORP (mV)</td><td>130.7</td><td>375.8</td><td>Mildly to moderately reducing</td></tr>
<tr><td>Temperature (°C)</td><td>21</td><td>27.1</td><td>-</td></tr>
<tr><td rowspan="4">Tertiary Formation</td><td>DO (mg/L)</td><td>0.48</td><td>1.06</td><td>Poor to mildly oxygenated</td></tr>
<tr><td>EC (µS/cm)</td><td>844</td><td>26,620</td><td>Brackish to saline</td></tr>
<tr><td>pH</td><td>6.68</td><td>7.27</td><td>Near neutral</td></tr>

<tr><td>Estate Management Works or Training Activities</td><td>During the sampling event no notable estate works or training activities were observed in the vicinity of sampling locations which may have had a material impact upon the sampling event and analytical data.</td></tr>
</table>

4.1.2 Groundwater Analytical Results

The groundwater analytical results for PFAS from this sampling event are presented in **Table T2** in **Appendix B**. There were no first-time exceedances of the human health drinking water guideline value. There was one first time detection of PFOA in the sample from MW043 (0.02 µg/L). This is recorded in **Table 10** below and displayed on **Figure 5, Appendix A**.

Concentrations of sum of PFHxS and PFOS in 20 of the 40 groundwater samples exceeded the drinking water guideline value with eight samples exceeding the PFOA guideline.

All 25 groundwater samples that exceeded the limit of reporting exceeded the ecological guideline for PFOS for 99% protection of ecosystems with 15 of these samples also exceeding the 95% protection guideline value. One groundwater sample (MW046) exceeded the PFOA ecological guideline for 99% protection of freshwater species but this sample did not exceed the 95% protection guideline.

Table 10 First-time detections or exceedances of sum of PFHxS+PFOS or PFOA in groundwater

First time detection / exceedance	Ground-water Sampling location	Sum of PFHxS+PFOS concentration (µg/L)		PFOA concentration (µg/L)	
		October 2021	Historical maximum	October 2021	Historical maximum
First time detections of PFHxS+PFOS or PFOA in groundwater	MW043	0.49	0.15	0.02	<0.01

Note: Blue shading indicates a sample with a first-time detection of PFOS+PFHxS or PFOA
Yellow shading indicates a sample with a first time exceedance above human health drinking water guideline values (refer to **Table 7**).

The first-time detection of PFOA in the sample from MW043 marginally exceeded the laboratory limit and may be a false positive. PFAS is known to be present in groundwater at this location and sum of PFHxS and PFOS concentrations have been frequently detected during historical sampling events.

4.2 Surface Water

4.2.1 Surface Water Observations and Field Measurements

Table 11 Surface Water Observations and Field Measurements

<table>
<tr><th>Item</th><th>Details</th></tr>
<tr><td>Access</td><td>All surface water sampling locations were accessed during the sampling event, with the exception of SW048 that was dry. SW048 is a drain sampling location.</td></tr>
<tr><td>Field Observations</td><td>Eight surface water samples had an organic odour: SW008, SW021, SW030, SW033, SW037, SW041, SW056 and SW059.

Seven surface water samples had a sheen appearance: SW002, SW030, SW037, SW038, SW041, SW067 and SW080.

No visual or olfactory indications contamination were observed during the sampling of the other surface water sampling locations. Field observations are reported in Table T3, Appendix B.</td></tr>
<tr><td>Surface Water Quality Parameter Field Measurements</td><td>Surface water quality parameters were measured prior to collecting surface water samples. The readings are presented in Table T3 in Appendix B and are summarised below:

4.2.2 Surface Water Analytical Results

The analytical results for PFAS in surface water from this sampling event are presented in **Table T4** in **Appendix B**. There were no first-time detections of PFHxS+PFOS and PFOA or first-time exceedances of the adopted human health or ecological guidelines compared to the historical dataset.

Concentrations of sum of PFHxS and PFOS in 12 of the 48 surface water samples exceeded the recreational water guideline value with none of the samples exceeding the PFOA guideline. All 34 surface water samples that exceeded the limit of reporting exceeded the ecological guideline for PFOS for 99% protection of ecosystems with 21 of these samples also exceeding the 95% protection guideline value. None of the samples exceeded the PFOA ecological guidelines for either 95% or 99% protection of freshwater species.

4.3 Sediment

4.3.1 Sediment Observations and Field Measurements

Table 12 Sediment Observations

Item	Details
Access	All sediment sample locations were accessible.
Field Observations	Sediment logging data are presented in **Table T5** in **Appendix B**. No visible or olfactory indications of contamination were observed during sampling at the sediment sampling locations.
Weather Conditions	Weather conditions during groundwater sampling were generally hot and dry with periods of overcast weather. A total of 57.2 mm of rainfall was recorded during the sampling period from 19 – 28 October 2021 (Bureau of Meteorology (BOM) station 040004 – 'Amberley AMO).
Estate Management Works or Training Activities	During the sampling event no notable estate works or training activities were observed in the vicinity of sampling locations which may have had a material impact upon the sampling event and analytical data.

4.3.2 Sediment Analytical Results

The analytical results for PFAS in sediment from this sampling event are presented in **Table T6** in **Appendix B**. First-time detections from the historical dataset are recorded in **Table 13** below. The result is displayed on **Figure 6, Appendix A**. The detection of PFOA for the first-time in samples SD004 and SD045 are not considered of significance as the concentrations of PFOA marginally exceeded the limit of reporting and other PFAS (PFHxS and PFOS) have been consistently detected at these sampling location during the OMP sampling events.

Table 13 First-time detections of sum of PFHxS+PFOS or PFOA in sediment

First time detection / exceedance	Sediment sampling location	Sum of PFHxS+PFOS concentration (mg/kg)		PFOA concentration (mg/kg)	
		October 2021	Historical maximum	October 2021	Historical maximum
First time detections of PFHxS+PFOS or PFOA in sediment	SD004	0.0051	0.0174	0.0003	<0.0002
	SD045	0.0028	0.0044	0.0002	<0.0002

Note: Blue shading indicates a sample with a first-time detection of PFOS+PFHxS or PFOA

5.0 Summary and Next Sampling Event

5.1 Summary of Monitoring Event

A groundwater, surface water and sediment monitoring event was completed within the RAAF Base Amberley Management Area between 19 and 28 October 2021. The program included sampling of groundwater from 46 monitoring wells and 49 co-located surface water and sediment sampling locations. Forty of the monitoring wells, and 48 of the surface water locations and all 49 sediment locations were able to be sampled.

Table 14 summarises the findings of the October 2021 sampling event and the recommended actions.

Table 14 Summary of Sampling Event

Item	Comment	Recommended Actions
Access to sampling locations	A total of 40 out of the 46 monitoring wells were accessible. Four on-Site wells (MW015, MW039, MW040, MW056) have been destroyed during construction of new infrastructure. Two on-Site wells were damaged and could not be sampled (MW008 and MW009). The loss of these monitoring wells has the potential to impact the understanding of the distribution of PFAS in groundwater. All surface water sampling locations were accessed during the sampling event with the exception of one on-Site drain sampling location (SW048) which was dry. All sediment sampling locations were accessible.	The interpretative report (AECOM, 2021b) has recommended the installation of five new monitoring wells to replace destroyed/damaged wells. Defence has advised that the installation of new wells will be considered during the PMAP review planned for 2022. Sampling of on-Site drains should continue to be timed to occur after a rainfall event.
Groundwater level loggers	The groundwater level logger deployed in MW055D appears to have failed.	Deployment of a new logger in MW055D.
Monitoring well network condition	No issues were identified in 35 out of the 40 monitoring wells sampled. Slight damage was observed to five monitoring wells which have cracked gatic collars or lids. These were MW021, MW031, MW042, MW047, MW050. During sampling of MW002 it was noted that the base of the well was clogged with a significant sediment load.	Minor repairs are required to these monitoring wells, which should be addressed during the drilling of the replacement wells. MW002 should be re-developed before the next sampling event.
Analytical Results	PFAS concentrations in 39 of the 40 groundwater samples were consistent with historical results. PFAS concentrations in all 48 surface water samples collected were consistent with historical results. PFAS concentrations in 48 of the 49 sediment samples were consistent with historical results.	Ongoing monitoring in accordance with the OMP.
First-time detections of Sum	One first-time detection of PFAS above the laboratory limit of reporting was recorded in the groundwater sample from MW043 with PFOA	Ongoing monitoring in accordance with the OMP.

Item	Comment	Recommended Actions
of PFHxS and PFOS or PFOA	detected at a concentration slightly above the laboratory limit of reporting. No first-time detections of PFAS above the laboratory limit of reporting were recorded in any of the surface water samples collected. Two of the 49 sediment samples recorded a first-time detection of PFOA (SD004 and SD045), at concentrations slightly above the limit of reporting. Other PFAS compounds have been detected in samples from SD004 and SD045.	
First time exceedance of NEMP drinking water guideline values	No first-time exceedances of the NEMP drinking water guideline values were recorded.	Ongoing monitoring in accordance with the OMP.

5.2 Upcoming Sampling Events

The next biannual sampling event is scheduled for March / April 2022.

5.3 Upcoming Annual Interpretive Report

The next annual interpretative report is scheduled for May 2022.

Notes
mbtoc - metres below top of casing
mAHD - metres above Australian Height Datum
TOC - top of casing
DO - Dissolved Oxygen
EC - Electrical Conductivity
Er - Uncorrected Oxidation Reduction Potential
Eh - Corrected Oxidation Reduction Potential
` - no data
Er converted to Eh by adding 205 based on a YSI with Ag/AgCl sensor calibrated to a 3.5 molar KCL solution
mg/L - milligrams per litre
µS/cm - microsiemens per centimetre
mV - millivolts
°C - degrees Celcius

LOR is limit of reporting
µg/L is micrograms per litre
'-' denotes no analysis undertaken
'<' denotes concentration is less than
NEMP is National Environmental Mangement Plan
NHMRC is National Health Medical Research Council
Denotes first time detection above LOR
Denotes new exceedance of human health guideline values

Notes

DO - Dissolved Oxygen

EC - Electrical Conductivity

Er - Uncorrected Oxidation Reduction Potential

Eh - Corrected Oxidation Reduction Potential

` - no data

Er converted to Eh by adding 205 based on a YSI with Ag/AgCl sensor calibrated to a 3.5 molar KCL solution

mg/L - milligrams per litre

µS/cm - microsiemens per centimetre

mV - millivolts

°C - degrees Celcius

NEMP is National Environmental Mangement Plan
NHMRC is National Health Medical Research Council
Denotes first time detection above LOR
Denotes new exceedance of human health guideline values

Property ID	Location ID	Sample Date	Sample Description	Odour
0861	SD002	25/10/2021	sandy CLAY, brown, medium plasticity.	No odour
0861	SD003	22/10/2021	sandy CLAY, brown, soft, medium plasticity, medium to coarse grained sands, trace of leaves and grass roots.	No odour
0861	SD004	19/10/2021	clayey SAND, grey-black fine grained, with grass and roots.	No odour
0861	SD005	19/10/2021	sandy CLAY, brown, with rootlets.	No odour
0861	SD008	26/10/2021	sandy CLAY, brown, medium plasticity.	No odour
0861	SD009	22/10/2021	sandy CLAY, brown, soft, medium plasticity, medium to coarse grained sands, trace of leaves and grass roots.	No odour
0861	SD011	26/10/2021	sandy CLAY, brown, medium plasticity.	No odour
0861	SD015	19/10/2021	sandy CLAY, brown, medium plasticity, with rootlets.	No odour
0861	SD016	19/10/2021	clayey SAND, grey-black fine grained, with grass and roots.	No odour
0861	SD018	19/10/2021	sandy CLAY, brown, medium plasticity, with rootlets and gravels.	No odour
0861	SD020	19/10/2021	sandy CLAY, brown, medium plasticity, with rootlets.	No odour
0861	SD021	21/10/2021	sandy GRAVEL, loose, medium grained, angular, trace of leaves.	No odour
0861	SD025	22/10/2021	sandy CLAY, brown, soft, low plasticity, medium to coarse grained sands, trace of leaves and grass roots.	No odour
0861	SD026	20/10/2021	sandy CLAY, brown, high plasticity.	No odour
0861	SD027	26/10/2021	gravelly SAND.	No odour
0861	SD028	19/10/2021	sandy CLAY, brown, high plasticity.	No odour

LOR is limit of reporting
mg/kg is milligrams per kilogram
µg/kg is micrograms per kilogram
'-' denotes no analysis undertaken
'<' denotes concentration is less than
Denotes first time detection above LOR

Analytical Data Validation

Appendix C Analytical Data Validation

DATA VALIDATION REPORT

Project No.:	60612563	**Validation by:** CM		**Date:**	23/11/2021
Client:	Department of Defence				
Site:	Royal Australian Airforce Base, Amberley				
Matrix type:	Groundwater, surface water, sediment	**Data verified by:** JP		**Date:**	26/11/2021
No. of primary samples:	40 groundwater, 48 surface water, 49 sediment				
Laboratory:	ALS (Brisbane), NMI (Sydney)	**Project Manager:** JP			
Lab reference:	EB2130815; EB2130821; EB2130823; EB2130835; EB2130850; AECO06_211029 (RN1333717), EB2134318				

Key Issues:	Two groundwater samples (from MW057S and MW057I) reported anomalous results (report number EB2130835), which were considered to be due to mislabelling of the sample bottles. The wells were resampled with the results (reported on EB2134318) consistent with historical results. The results for MW057S and MW057I on EB2130835 have been disregarded with the results reported for EB2134318 used in replacement. No other QA/QC issues were identified in the field or laboratory datasets that could have a material implication on data interpretation and therefore decision-making on the project. The data are considered appropriate for use to meet the project objectives.

Field QA/QC

Sampling personnel	Sampling was conducted by AECOM environmental scientists between 19 and 28 October 2021 and on 26 November 2021.
Sampling Methodology	Samples were collected using appropriate methods as identified within the main body of the report and as presented in the SAQP.
Chain of Custody	COC documents completed as per AECOM procedures.
Rinsate Blank	Rinsate blank samples were collected at a frequency of one per day of sampling where appropriate (six in total) during the monitoring between 19 and 28 October 2021. Rinsates were collected from the decontaminated interface probe. On days where dedicated sampling equipment was used to obtain samples (e.g. hydrasleeves were being collected) no rinsates samples were required. Concentrations reported below the LOR for all analytes tested. See Table C4.
Field Blanks Trip Blanks	Field blank samples were collected at a frequency of one per day of sampling (nine in total between 19 and 28 October 2021) by filling sample containers with laboratory supplied deionised water in the field. A field blank was inadvertently not collected during a resampling visit conducted on 26 November 2021. All field blanks reported concentrations below the LOR for the analytes tested. See Table C4. The non-collection of the field blank on 26 November 2021 is not considered to impact data quality. Trip blank samples were present during the transport of samples during the sampling between 19 – 28 October 2021 for both the primary and secondary laboratory samples. Four water trip blanks and four soil trip blanks all reported concentrations below the LOR, see Table C5.
Frequency of field QC	Field duplicate (inter-laboratory duplicates) and triplicates (inter-laboratory duplicates) were collected. Nine duplicates/triplicate sets for groundwater and surface water (see

	Tables C1 and C2) and five duplicate/triplicate sets for sediment. The frequency of field QC achieves the expected frequency for each media type. The target frequency of one in ten primary samples was achieved for all matrices.
Handling and preservation	Primary, duplicate and triplicate samples were received preserved and chilled at the laboratory. All samples were received at the laboratory in appropriate sample containers with no sample container non-compliances noted.
Laboratory QA/QC	
Tests requested/reported	Samples were analysed and reported as requested on the COC.
Holding time compliance	Samples were extracted and analysed within recommended holding times.
Laboratory Accreditation	The laboratory analysis was conducted by ALS Environmental Pty Ltd (Brisbane) a National Association of Testing Authorities (NATA) accredited laboratory. The triplicate samples were analysed at the National Measurement Institute (Sydney), also a NATA accredited laboratory.
Frequency of laboratory QC	The laboratory reported a sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision, except: • Matrix spikes and laboratory duplicates for PFAS (both 0.00%) which is below the expected rate of 5.0% (for matrix spikes) and 10.00% (duplicates) in the following batches: o EB22130823 (19 samples in batch) o Laboratory duplicates (water) for PFAS (7.69%) which is below the expected rate of 10.00% in the following batches: o EB2130815 (13 samples in batch) o EB2130821 (13 samples in batch) o Laboratory duplicates (water) for PFAS (6.52%) which is below the expected rate of 10.00% in the following batches: o EB2130835 (46 samples in batch) o Laboratory duplicates (water) for PFAS (9.68%) which is below the expected rate of 10.00% in the following batches: o EB2130850 (31 samples in batch) o Matrix spikes (water) for PFAS (2.17%) which is below the expected rate of 5.00% in the following batches: o EB2130835 (46 samples in batch) The reason for insufficient matrix spikes and laboratory duplicates is unknown as the laboratory was provided with sufficient sample volume across the project batches, however as all other QC results met control limits this is not expected to impact data quality.
Method Blank	No method blank non-compliances were reported.
Laboratory duplicate RPDs	Laboratory duplicate Relative Percentage Differences (RPD) were within control limits for all samples.
Laboratory control spike recovery	No non-compliances were reported for Laboratory Control Spikes (LCS).
Matrix spike recovery	All matrix spike (MS) recoveries (where reported) were within control limits, except: • EB2130850: MS recovery for FOSA and 10:2 FTS were not determined as the recovery was greater than the upper data quality objective. This indicates that matrix interference may have occurred in isolated samples. These non-conformances are not expected to impact data quality.
Surrogate spike recovery	Surrogate spike recoveries were within control limits for all samples.

QA/QC Data Evaluation	
Comparison of Field Observations and Laboratory Results	No anomalous results between field observations and analysis results were noted.
Data transcription	A random 10% check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	Limits of Reporting (LORs) were sufficiently low to enable assessment against adopted screening levels except for PFOS for NEMP (HEPA, 2020) ecological guideline values for the 99% protection of freshwater species. The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR. This should be taken into consideration when interpreting and using this data quantitatively where results are reported below LOR.
Field QAQC RPDs	RPDs for groundwater surface water and sediment samples are reported in Tables C1, C2 and C3 respectively. Field duplicate and triplicate RPDs were reported within control limits for all groundwater, surface water and sediment samples except the following (the sample with the higher concentration is in bold). • **0861_MW032_211025** and 0861_QC262_211025 for PFHxA (31%) • **0861_MW007_211027** and 0861_QC265_211027 for PFHpS (38%), PFHpA (41%), PFHxA (49%), PFPeS (33%), PFOS (56%), PFOA (45%) PFHxS (40%) • 0861_SD030_211026 and **0861_QC164_211026** for PFOS (34%) • 0861_SD030_211026 and **0861_QC264_211026** for PFUnDA (32%) The majority of the higher RPDs for groundwater and sediment are for the triplicate samples. The RPD results are not considered to impact the interpretation for this investigation but do demonstrate that there are differences in laboratory analysis and extraction methods in water and sediment samples. Many of the RPDs are related to low detected concentrations or near the limit of reporting. It is noted that the QC samples results were within the same order of magnitude as the primary sample. The elevated RPDs for the sediment samples is potentially also attributable to sample heterogeneity. Where the triplicate samples highlighted above reported a higher concentration than the primary sample, the higher triplicate sample concentrations do not constitute a first-time detection of PFOA or PFHxS+PFOS or a new maximum of the same concentrations and therefore the elevated RPDs are not considered to affect data interpretation for use in this report. The higher concentration has however conservatively been adopted in the report tables All remaining samples reported within the control limits.
Other	
Other observations	Comparison of the results for MW057S and MW057I sampled on 22 October 2021 on EB2130815 with historical results indicated anomalies. The 22 October 2021 results indicated PFAS not detected above the LOR in MW057S with PFAS detected in the sample from MW057I at concentrations exceeding the drinking water guideline. The historical results indicate the reverse- PFAS is typically not detected at MW057I and has consistently been detected in samples from MW057S. The results suggest the samples have been mislabelled, possible in the field during sampling. As a first step, the laboratory was asked to check the results and reextract the sample from the bottles supplied. The laboratory verified the original results. Subsequently, monitoring wells MW057S and MW057I were resampled on the 26 November 2021. The results of the resampling (reported in EB2134318) were consistent with historical results (i.e. PFAS no detected in the sample from MW057I). Therefore, the results reported for MW057S and MW057I on EB2130815 have been disregarded and the results collected on 26 November 2021 (EB2134318) have been used in replacement.

Dates

Date Samples Received	: 28-Oct-2021 12:50	Issue Date	: 01-Nov-2021
Client Requested Due Date	: 05-Nov-2021	Scheduled Reporting Date	: **05-Nov-2021**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Intact.
No. of coolers/boxes	: 3	Temperature	: 5.0°C, 9.8°C, 6.2°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 18 / 18

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: The LOR for particular analytes have been raised for some samples due to matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Sample "0861_SD040_211019" required dilution due to sample matrix. LOR values have been adjusted accordingly and matrix spike recovery not determined.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2130815**	Page	: 1 of 7
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 28-Oct-2021
Site	: ----	Issue Date	: 05-Nov-2021
Sampler	: [redacted]	No. of samples received	: 18
Order number	: 60612563 3.1	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	13	7.69	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X-INJ PFAS: Sample "0861_MW054S_211028" required dilution due to sample matrix. LOR values have been adjusted accordingly.
- 231X-INJ PFAS by LCMSMS: Sample '0861_MW054S_211028' has been tested to the legacy QSM 5.1 aligned, NATA accredited method due to sample matrix being unsuitable for SPE extraction (high sediment content).
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist - PFAS	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2130821**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 28-Oct-2021
Site	: ----	Issue Date	: 05-Nov-2021
Sampler	: [redacted]	No. of samples received	: 2
Order number	: 60612563 3.1	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	13	7.69	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / ***Container*** / Client Sample ID(s)	***Sample Date***	*Extraction / Preparation*			*Analysis*

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-INJ	WATER	In house: Direct injection analysis of fresh waters after dilution (1:1) with mobile phase solvent. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
Preparation for PFAS in water.	EP231-PR	WATER	Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to analysis.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **The laboratory acknowledges your requested reporting date of 5 days, however due to the analytical request and associated procedures involved the requested due date will not be possible. Please note the best practical due date has been assigned.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **An extra sample was received labelled as "QC343" (ALS #21) and has been placed on hold. If testing is required on this sample, please contact ALS Client Services at** [redacted]
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 20		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Senior Organic Chemist - PFAS	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Matrix spike recovery not determined due to dilution of primary sample.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: PO BOX 1307 FORTITUDE VALLEY QLD, AUSTRALIA 4006	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 28-Oct-2021
Order number	: 60612563 3.1	Date Analysis Commenced	: 02-Nov-2021
C-O-C number	: ----	Issue Date	: 05-Nov-2021
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 21		
No. of samples analysed	: 20		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
[redacted]	Senior Organic Chemist - PFAS	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Laboratory sample ID	Sample ID	Method: Compound	CAS Number	Matrix Spike (MS) Report: Spike Concentration	SpikeRecovery(%): MS	Acceptable Limits (%): Low	Acceptable Limits (%): High

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2130823**	Page	: 1 of 7
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 28-Oct-2021
Site	: ----	Issue Date	: 05-Nov-2021
Sampler	: [redacted]	No. of samples received	: 21
Order number	: 60612563 3.1	No. of samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Dates

Date Samples Received	: 28-Oct-2021 12:50	Issue Date	: 01-Nov-2021
Client Requested Due Date	: 05-Nov-2021	Scheduled Reporting Date	: **09-Nov-2021**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Not Available
No. of coolers/boxes	: 3	Temperature	: 5.0°C, 9.8°C, 6.2°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 85 / 85

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders EB2130835 / EB213850 due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on** [redacted]
- Please note that a sample container for ALS #4 was received empty.
- **The laboratory acknowledges your requested reporting date of 5 days, however due to the analytical request and associated procedures involved the requested due date will not be possible. Please note the best practical due date has been assigned.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **EB2130835**	Page	: 1 of 45
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	Contact	: [redacted]
Address	: PO BOX 1307 FORTITUDE VALLEY QLD, AUSTRALIA 4006	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: [redacted]	Telephone	: [redacted]
Project	: 60612563 3.1 QLD_0861_PFASOMP	Date Samples Received	: 28-Oct-2021 12:50
Order number	: 60612563 3.1	Date Analysis Commenced	: 01-Nov-2021
C-O-C number	: ----	Issue Date	: 09-Nov-2021 13:59
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3_QLD		
No. of samples received	: 85		
No. of samples analysed	: 85		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
	Senior Organic Chemist - PFAS	Brisbane Inorganics, Stafford, QLD
	Senior Organic Chemist - PFAS	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **SPLIT WORK ORDER: It should be noted that ALS has split this work order over the following work orders EB2130835 / EB213850 due to the size of the sample numbers. For any further information regarding this processing of samples please contact ALS client services division on** [redacted]
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Particular samples required dilution due to sample matrix. LOR values have been adjusted accordingly and surrogate recoveries not determined.
- EP231X PFAS: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X PFAS: The LOR of particular analytes have been raised due to sample matrix interferences.
- EP231X-LL PFAS Low level: Matrix spike recovery not determined due to dilution of primary sample.
- EP231X-INJ PFAS by LCMSMS: Particular samples have been tested to the legacy QSM 5.1 aligned, NATA accredited method due to sample matrix being unsuitable for SPE extraction (high sediment content).
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.
