EXECUTIVE SUMMARY[1]

Background

The Department of Defence (Defence) historically used per- and poly-fluoroalkyl substances (PFAS) containing aqueous film forming foams (AFFF) in firefighting and fire training activities at Royal Australian Air Force (RAAF) Base Darwin (the base). As a result, PFAS accumulated in soils, and is migrating off the base in groundwater and surface water.

Defence undertook an extensive investigation into PFAS at the base in 2018. This investigation assessed the potential risks PFAS poses to human health and environment both on and around the base. The findings of the investigation led to the preparation of a PFAS Management Area Plan (PMAP), which summarises how Defence plan to manage and reduce PFAS moving off the base. The PMAP also included an ongoing monitoring plan (OMP) to observe changes in PFAS movement as Defence undertook active management and remediation of PFAS.

The OMP explains how groundwater, surface water and biota (fish and crustaceans) are to be sampled at and around the base. The monitoring program includes sampling during both the wet and dry seasons to measure how PFAS movement changes under different climate conditions.

Objective

The OMP objective is to monitor changes in PFAS concentrations and locations at the base and the surrounding areas (as shown on Figure 1, Appendix A). Defence uses the data collected to plan how PFAS is managed to help protect human health and the environment.

PFAS Management Area

The PFAS Management Area (as shown on Figure 1, Appendix A) includes the base and selected off-base areas including communities of Ludmilla, The Narrows and parts of Winnellie, as well as parts of Rapid Creek, Ludmilla Creek, Sadgroves Creek and Reichardt Creek.

Defence manage eleven primary PFAS source areas within the Management Area, which are listed in Section 2.2.

Ongoing Monitoring Report

Tetra Tech Coffey Pty Ltd (Tetra Tech Coffey) was engaged by Defence to prepare this Ongoing Monitoring Report (OMR) on sampling of groundwater, surface water and biota completed by AECOM Pty Ltd (AECOM) in the PFAS Management Area between June 2023 and April 2024 (the 'reporting period') as recommended in the PMAP and the OMP.

This OMR summarises the results of groundwater, surface water and biota sampling undertaken by AECOM, includes comparisons to previously collected data and provides interpretation of the results of the monitoring. The interpretation looks at changes in PFAS concentrations in the Management Area. The sampling events undertaken by AECOM and included in this report include:

- Groundwater monitoring completed in October 2023 and March 2024.
- Biota monitoring completed in October 2023.
- Surface water sampling completed in December 2023 and March 2024.
- Surface water sampling completed in August 2023, January 2024, February 2024 and April 2024 at key locations in addition to the main December 2023 and March 2023 events.

[1] This executive summary must be read in the context of the full report and the attached limitations.

Interpretive analysis

Data collected during the reporting period were compared to historical data for sampling locations included in the OMP.

PFAS concentrations were within the same order of magnitude as historical results, with higher concentrations reported at the PFAS source areas, and lower concentrations outside of these areas. This is consistent with previous sampling results.

Statistical analysis of the results indicates the majority of PFAS concentrations were stable or decreasing. However, PFAS will continue to move from the PFAS contaminated soils in PFAS source areas into groundwater and surface water.

Programs of work are underway to address PFAS source areas and reduce PFAS moving from the base. Remediation was completed at two of the eleven PFAS source areas in 2023 including the Former Fire Training Area 1 (FFTA1) and the AFFF contaminated soil stockpiles (also known as the Wrapped Stockpile Area). Remediation of three additional source areas is planned for 2024 and 2025 including Former Fuel Farm 4 (FFF4), Former Fuel Farm 6 (FFF6), and the Current Fire Training Area (CFTA).

A base-wide PFAS investigation is also being undertaken to plan for remediation of other source areas and continuation of the OMP will assess changes to PFAS concentrations in groundwater and surface water following remediation works.

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, from 10 to 100 is a single order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they can represent significant changes in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

Groundwater results

Groundwater at the base flows radially outwards from the centre of the base and discharges into the four creeks surrounding the base. Rapid Creek to the north and Ludmilla Creek to the west receives the majority of groundwater from the base. Wet season in Darwin typically occurs from November to April, when almost all of the yearly rainfall occurs, with dry season occurring between May to October. Groundwater levels at the base fluctuate by ten metres during the wet season compared to the dry season. The measured groundwater level changes during the reporting period were consistent with previous years.

The results of groundwater sampling were consistent with previous years with no significant changes in the concentrations or extent of PFAS observed. The key findings of the groundwater sampling include:

- The highest concentrations of PFAS in groundwater continue to be associated with existing PFAS source areas including FFF4, FFF6, the former ARFF Fire Station and the CFTA. Remediation is planned for FFF4, FFF6 and the CFTA in 2024 and 2025, and further investigation of the former ARFF Fire Station to assess remediation options is also planned in 2024 and 2025.
- PFAS concentrations in groundwater at FFTA1 reported a significant decrease by one- to two-orders of magnitude. Remediation of this source area was completed in 2023, and this source area will continue to be monitored.
- The majority of PFAS concentrations outside the PFAS source areas were consistent with previous results.
- No monitoring wells reported any new exceedances of human health guidelines during the reporting period.

Groundwater results are discussed in more detail in Sections 7.1, 8.2 and 8.3 of this report, with sampling locations shown in Figure 2, Appendix A.

Surface water results

PFAS concentrations in surface water were consistent with previous data and within an order of magnitude of historical results.

PFAS concentrations were above the human health recreational water guideline at two locations in Rapid Creek and one location in Ludmilla Creek during the monitoring period. These locations have previously been above the recreational water guideline and are consistent with historic data.

All monitoring locations (with the exception one from a drain leading to Rapid Creek), reported at least one result above the freshwater ecosystems guideline value for perfluorooctane sulfonic acid (PFOS) during this reporting period. This was also consistent with previous results.

Surface water results are discussed in more detail in Sections 7.2, 8.4 and 8.5 of this report, with sampling locations shown in Figure 3, Appendix A.

Aquatic biota results

The majority of PFAS concentrations in aquatic biota collected from Ludmilla Creek and Rapid Creek were consistent with historical data. One crustacean sample (a freshwater prawn) collected from within Rapid Creek reported PFOS an order of magnitude above other crustacean results and above the human consumption guidelines. Despite this increase, PFAS concentrations in aquatic biota from Rapid Creek and Ludmilla Creek are consistent with previous results.

The potential risks to human health from eating fish or crustaceans have not changed to those presented in the Detailed Site Investigation (DSI) (Coffey, 2018a), Human Health Risk Assessment (HHRA) (Coffey, 2018c) and the PMAP (Defence, 2019). The health advisories issued by the Northern Territory (NT) Department of Health in 2019 recommending limiting eating fish or crustaceans from the freshwater section in Rapid Creek are still in place.

Aquatic biota results are discussed in more detail in Sections 7.3 and 8.6 of this report, with sampling locations shown in Figure 4, Appendix A.

Conclusions

The conclusions of the June 2023 to April 2024 monitoring program interpretive assessment are:

- Groundwater levels fluctuate by up to ten metres across the Management Area over the wet and dry seasons, with higher groundwater levels recorded in the late wet season following sustained rainfall.
- Groundwater flows away from the centre of the base towards the nearby creeks.
- The results indicate that the concentrations and extent of PFAS in groundwater, surface water and aquatic biota are consistent with previous findings.
- The majority of concentrations of PFAS in groundwater were stable or decreasing. While fluctuations were observed due to seasonal variability, this is consistent with previous findings.
- The highest PFAS concentrations in groundwater were reported at PFAS source areas. Three source areas, where the highest concentrations were reported, are planned for remediation in 2024/2025.
- PFAS impacted stockpiles at the Wrapped Stockpile Area were removed and remediation at FFTA1 was completed in 2023.
- The conceptual site model (CSM) was reviewed in light of the data in this OMR and no changes to the risk profile were identified.
- Ongoing sampling as part of the OMP will continue to monitor the concentrations and extent of PFAS in groundwater, surface water and biota, PFAS movement at and from the Base, and any changes in potential risks to human health or the environment.

1. INTRODUCTION

Tetra Tech Coffey Pty Ltd (Tetra Tech Coffey) was engaged by the Department of Defence (Defence) to prepare this Ongoing Monitoring Report (OMR) for the Royal Australian Air Force (RAAF) Base Darwin (the Base), Northern Territory (NT).

This OMR summarises the results of groundwater, surface water and biota sampling undertaken by AECOM between June 2023 and April 2024 (the 'reporting period') as part of Defence's PFAS Management Area Plan (PMAP) and in accordance with the RAAF Base Darwin Ongoing Monitoring Plan (OMP) (Defence, 2019b). The OMR includes comparisons to previously collected data and provides interpretation of the results of the monitoring.

1.1 BACKGROUND

Defence undertook extensive investigations into PFAS at the base in 2018 which were documented within the RAAF Base Darwin Detailed Site Investigation (DSI) (Coffey, 2018a), Supplementary DSI (Coffey, 2018d), Human Health Risk Assessment (HHRA) (Coffey, 2018c) and Ecological Risk Assessment (ERA) (Coffey, 2018b) ('the investigation reports').

These investigations assessed the potential risks PFAS poses to human health and environment both on and around the base. The findings of the investigations led to the preparation of a PMAP, which summarised how Defence plan to manage and reduce PFAS moving off the base. The PMAP also included an OMP to monitor changes in PFAS movement as Defence undertook active management and remediation of PFAS.

The OMP details how groundwater, surface water and biota (fish and crustaceans) are to be sampled at and around the base. The monitoring program includes sampling during both the wet and dry seasons to measure how PFAS movement and/or concentrations change under different climate conditions.

1.2 PURPOSE AND OBJECTIVES

The objective of the ongoing monitoring program is to continue to assess changes in the concentrations and extent of PFAS within the environment, where Defence's historical use of legacy aqueous film forming foam (AFFF) has led to a potentially elevated risk to receptors, or potential future risk to receptors.

The objective of the OMR is to assess the changes in the extent, concentration and transport (pathways and flow rates) of PFAS and compare the results against human health and ecological guidelines and historical data to provide:

- An evidence base for targeted and effective risk management decision-making to protect human and environmental receptors.
- An early warning where additional management of PFAS contamination may be warranted in areas not currently understood to be affected by PFAS.

1.3 SCOPE OF OMR

The scope of works for this OMR included assessing changes to the extent of PFAS in groundwater, surface water and aquatic biota during the reporting period (June 2023 – April 2024) compared to historical data and assessing potential changes to the conceptual site model (CSM) and risk profile at the base using data collected by AECOM.

The following sampling events were included as part of this OMR:

- Groundwater monitoring completed in October 2023 and March 2024.
- Biota monitoring completed in October 2023.
- Surface water sampling completed in December 2023 and March 2024.
- Surface water sampling completed in August 2023, January 2024, February 2024 and April 2024 at key locations in addition to the main December 2023 and March 2023 events.

Data was evaluated from the following OMP factual reports (which are included in Appendix B):

- Dry Season Sampling Event Factual Report 2023, PFAS OMP – RAAF Base Darwin, 29 January 2024 (AECOM, 2024a)
- Wet Season Sampling Event Factual Report, 2024, PFAS OMP – RAAF Base Darwin, 3 July 2024 (AECOM, 2024b)

In addition to the above reports, the following previous reports (and associated data) were also assessed as part of this OMR:

- Interpretive Report 2020, PFAS OMP – RAAF Base Darwin, 28 January 2021 (AECOM, 2021)
- Ongoing Monitoring Interpretive Report (November 2020 – June 2023), PFAS OMP – RAAF Base Darwin, 25 August 2023 (AECOM, 2023a)
- RAAF Base Darwin, Detailed Site Investigation – Per- and Poly-fluoroalkyl Substances (PFAS), 5 February 2018 (Coffey, 2018a)
- RAAF Base Darwin, Supplementary Detailed Site Investigation Report Per- and Poly-fluoroalkyl Substances (PFAS), 2 November 2018 (Coffey, 2018d)
- RAAF Base Darwin, PFAS Human Health Risk Assessment (Coffey, 2018c)
- PFAS Management Area Plan – RAAF Base Darwin (Defence, 2019a)

2. BASE SETTING

2.1 ENVIRONMENTAL SETTING

The base identification and setting are summarised in Table 2-1 below. The base location and surrounds (including the PFAS Management Area) are shown in Figure 1, Appendix A.

Table 2-1: Environmental Setting

Element	Description
Base Name	RAAF Base Darwin
Base ID	1302
Address	Stuart Highway Winnellie, Northern Territory
Approximate Base Area	1,278 hectares
Title Identification	Commonwealth freehold title, comprising Sections 5060 and 3437 (Hundred of Bagot)
Current Land Use Zoning	Commonwealth Land
Regional meteorology	Darwin has a tropical climate with distinct monsoonal wet and dry seasons. Most of the rainfall occurs from November to April (wet season), although isolated rainfall events also occur at the beginning and end of the dry season. Evaporation is relatively constant with peaks during the wet season build-up. Maximum temperatures also occur during the wet season build-up, and minimum temperatures are reached in July. Average annual rainfall is 1,727 mm (measured at Darwin Airport Bureau of Meteorology (BOM) Station 014015) (www.bom.gov.au, August 2024).
Topography	The base is relatively flat, compared to surrounding land which is gently undulating in nature. It is gently sloping at a height of 10 to 33 m Australian height datum (m AHD) across several kilometres and slopes down along the northern and western boundaries. A topographic high runs approximately in line with the main runway and then to the north, parallel to Rapid Creek.
Geology	The geology underlying the base comprises the following: • Unconsolidated sands, clayey sands and ferruginous clayey sands and soil. This layer is often described as lateritic or ferricrete and may appear to be gravels. This layer thickness is one to two metres thick but can range up to 10 m thick. • Bathurst Island Formation consisting of siltstone, claystone, sandy claystone, clayey sandstone, quartz sandstone, ferruginous sandstone, glauconitic sandstone and conglomerates towards the base of the unit. The unit ranges between 17 and 27 m thick on the base. • Burrell Creek Formation consisting of siltstone, shale, sandstone, and quartz pebble conglomerate. The top of this unit was encountered at depths of 35 metres below ground level (m bgl).
Hydrogeology	There are two aquifer systems underlying and in the vicinity of the Base: • The unconfined water table aquifer consists of both the upper lateritic sediments and the Bathurst Formation. The two lithologies act as a single aquifer, and no significant confining layer is present. Groundwater levels in the upper aquifer may rise to ground level during the wet season due to recharge from surface water infiltration. In the wet season, groundwater is likely to flow through both units, however once groundwater levels drop in the dry season, groundwater flow is predominantly in the Bathurst Formation (siltstone). • The Burrell Creek Formation aquifer underlies the Bathurst Formation aquifer, and is a confined aquifer comprising siltstone, shale, and sandstone and quartz pebble conglomerate.
Groundwater depth and flow	Standing water levels in the upper unconfined aquifer are subject to significant seasonal variation and appear to change by more than ten metres between wet and dry seasons on the northern portion of the Base, by approximately five metres in the southern portion of the Base, and by less

Element	Description
	than one metre adjacent to Rapid Creek (northwest of the Base), and in the southwestern corner of the base. The groundwater flow direction in the upper unconfined aquifer follows surface topography with groundwater flowing: • to the north (towards Rapid Creek) from the southern side of the main runway • to the south (towards Sadgroves and Reichardt Creeks) in the south of the Base, and • to the west and southwest (towards Ludmilla Creek) in the southwest of the base.
Base drainage	The base is drained by large, open, unlined drains, municipal drains and underground piping that discharge surface waters into: • Rapid Creek on the north and east sides of the base via Marrara Swamp. Rapid Creek is a freshwater stream that is fed by groundwater during the dry season and flows to the northwest prior to discharging to Beagle Gulf. The lower portion of Rapid Creek becomes estuarine prior to discharging to the marine environment at the mouth. • Sadgroves Creek on the south. Sadgroves Creek is an estuarine creek and tidally influenced. • Ludmilla Creek on the west. Ludmilla Creek is mixture of freshwater, estuarine and marine and flows to the west prior to discharging to Beagle Gulf. • A small central portion of the base on the southern boundary discharges to Reichardt Creek.
Current and previous land use	The base was constructed in 1940 as an operational military airfield. The base is now a joint civil-military airstrip with Darwin International Airport (DIA) north of the main runway. The base is bounded by McMillans Road to the north, Amy Johnson Avenue to the east, Stuart Highway to the south and Bagot Road to the west. Current surrounding land uses include: • North: DIA, Marrara Swamp and vegetation corridor. The residential suburbs Marrara, Milner, Malak and Moil are located beyond DIA. • East: Nurseries, small farms, residential areas and industrial/commercial zones. • South: Industrial suburb of Winnellie and Darwin Showgrounds. The residential suburb of The Narrows is located southeast of the base. • West: Residential suburbs of Bagot and Ludmilla and the industrial portion of Coconut Grove.

2.2 SOURCE AREAS

PFAS source areas were identified across the base associated with historical storage, usage, handling and distribution of legacy AFFF containing PFAS as a part of the DSI (Coffey, 2018a). The primary source areas, as outlined in the PMAP (Defence, 2019a) are shown on Figure 1, Appendix A and include:

- Former Fire Training Area 1 (FFTA1) (Note: This area has also previously been called the Former Fire Training Ground 1)
- Former Fuel Farm 5 (FFF5)
- Former Fuel Farm 4 (FFF4)
- Former Fuel Farm 6 (FFF6)
- Wrapped Stockpile Area (Note: This area has also previously been called the ‘AFFF Contaminated Soil Stockpiles’)
- Former Aviation Rescue Fire Fighting (ARFF) fire station
- Hangar 31
- Former Fuel Farm 1 (FFF1)
- Former RAAF Fire Station (RAAF-FS)
- Current (Hot) Fire Training Area (CFTA)
- Former Fire Training Area 2 (FFTA2)

2.3 PFAS MANAGEMENT AREA

The Management Area covers the base (groundwater and surface water) and discrete areas off-Base, specifically groundwater beneath part of Ludmilla and under DIA, and surface water systems of Rapid Creek, Ludmilla Creek, Sadgroves Creek and Reichardt Creek. The location of the base and Management Area is shown in Figure 1, Appendix A.

2.4 REMEDIATION PROJECTS

The PMAP includes various management actions to address PFAS risks that include direct remediation of PFAS source areas. The aim of remediation projects is to reduce PFAS leaving the Base, by focusing on the remediation and management of source areas. Over time we should see a reduction in PFAS leaving the base through surface water and groundwater.. The PMAP (Defence, 2019a) sets out the management measures to address soil and water PFAS contamination to reduce risks to receptors.

At the Base, PFAS was found to be primarily moving through surface water, whilst groundwater discharge to Rapid Creek also contributes to some of the PFAS migration off-base. Given that complete prevention of off-base migration is unlikely to be achievable, Defence aims to remediate PFAS impacts and off-base migration so-far-as-reasonably-practicable (SFARP).

2.4.1 Remediation completed during reporting period

Remediation projects that were undertaken and/or completed during the reporting period included:

- **Remediation of FFTA1 and the Wrapped Stockpile Area**

  The FFTA1 and Wrapped Stockpile Area remediation works commenced in June 2022 and were completed in November 2023 (Tetra Tech Coffey, 2024a). As part of the remediation, approximately 280 m^3 of PFAS contaminated soils removed from base for thermal destruction, and approximately 3,500 m^3 of PFAS impacted soils treated and reinstated into the area. The treated soils were capped with a 300 mm thick clay cap and finished with either a gravel hardstand (western portion) or topsoil and grass (eastern portion).

  The remediation treated or removed approximately 16 kg of PFAS from soils within the FFTA1 source area. Soils from the Wrapped Stockpile Area, which contained PFAS impacted soils removed from around Hangar 31 in 2008, were also treated and placed into the FFTA1 excavation. Approximately 5.3 kg of PFAS in the Wrapped Stockpile Area were treated.

- **Interim PFAS management measures at CFTA**

  Interim PFAS management measures at CFTA included the removal of the large mock-up (LMU) fire training apparatus and covering of the concrete fire-training pad to reduce PFAS leaching from the concrete pad and discharging to the environment.

- **Treatment of PFAS-impacted water**

  An AFFF deluge event at an aircraft hangar on the base with Class B foam resulted in the generation of PFAS impacted water. This water was treated on the base using a portable water treatment facility to remove PFAS prior to discharge of the treated water.

2.4.2 Scheduled remediation project

Remediation projects that are scheduled to commence at the base include:

- **Implementation of Balance of Base Remediation Action Plan (RAP)**

  Implementation of the Balance of Base RAP (Tetra Tech Coffey, 2023) is scheduled to commence in dry season 2024. These works will target the following source areas:

  - CFTA
  - FFF4
  - FFF6

  Additional soil, concrete and groundwater investigations were undertaken at the CFTA and former ARFF Fire Station in 2023 and 2024 to inform the RAP and remediation works. Further soil and groundwater investigations are planned at the former ARFF Fire Station in 2024 and 2025 to assist with remediation planning for this source area.

- **FFTA2 Remediation**

  Liaison is continuing with DIA regarding remediation planning for FFTA2, which is located on DIA-occupied land. Further soil investigations are being undertaken in 2024 to inform RAP development with remediation to be scheduled in the future. RAP development for this source area is scheduled for late 2024.

2.5 INFRASTRUCTURE PROJECTS

Development works at the base have included several infrastructure projects over the reporting period that may have resulted in the disturbance and stockpiling of soil, including (but not limited to):

- P0009 Runway works
- RAAF Base Darwin Stormwater works
- Solar Farm Works
- Tin City 6 works
- J105 Health centre (new build)

Each project is responsible for how they manage PFAS impacted soil and/or groundwater under their approved Environmental Clearance Certificates. However, due to the movement of soil as a result of these projects, potential exists for some mobilisation of PFAS.

Following discussions with base staff, we understand that minor PFAS contamination was detected in small areas of the runway surface asphalt removed during the runway works project. We understand that the impacted asphalt is currently stockpiled and awaiting off-base disposal. The location of Tin City 6 is near the former RAAF Fire Station across Bukatilla Road. However, PFAS impacts in soils in the area of the development was negligible.

Tetra Tech Coffey is not aware of any other practices or recent incidents which are likely to have resulted in changes to the nature or extent of PFAS at the base.

3. SAMPLING AND ANALYTICAL SCOPE AND METHODOLOGY

AECOM prepared a sampling analysis and quality plan (SAQP) (AECOM, 2023b) that included the details for how the sampling required by the OMP (Defence, 2019b) was to be undertaken. The SAQP (included in Appendix B) provides the details of the sampling locations and media, sampling schedule, justification of sampling approaches, sampling methodologies, analytical schedule and the approach to ensuring quality assurance (QA) and quality control (QC) requirements were achieved.

3.1 ONGOING MONITORING SCOPE

A summary of the monitoring events undertaken under the SAQP (AECOM, 2023b), and monitoring completed during the reporting period is provided in Table 3-1 below. The detailed summary of sampling locations is included in Appendix C of the SAQP (AECOM, 2023b) (provided in Appendix B of this report).

Table 3-1: Scope of work as per SAQP

Sample Matrix	Number of sample locations	Frequency	Monitoring events per year	Approximate monitoring period
Groundwater (on- and off-Base)	34	Biannual	2	End of dry season (October – December) and end of wet season (March)
Surface water (off-Base)	14	Twice in wet season	2	Start of wet season (as soon as practicable after first flush rain event, nominally December / January) and end of wet season (March)
Surface water (off-Base)	1	Monthly in wet season	5	Monthly between December – April
Surface water (off-Base)	1	Monthly in wet season and twice during dry season	7	Monthly between December – April, and June and August
Surface water (on-Base)	2 [1]	Monthly in wet season	5	Monthly between December – April
Surface water (on-Base)	6 [2]	Twice in wet season	2	Start of wet season (as soon as practicable after first flush rain event, following a great than 100 mm rain event, nominally December / January) and end of wet season (March)
Aquatic biota (off-Base)	6	Annually	1	End dry season or start wet season (October – December)

Notes:

1. Table 1, Section 1.3 of the SAQP (AECOM, 2023b), and Table 3, Section 2.1 of the Wet Season Sampling Event Factual Report, 2024 (AECOM, 2024b) both state the number of locations to be sampled monthly in the wet season is listed as 2. In contrast Table 2, Appendix C of the SAQP lists three locations (SW152, SW170, SW312) to be sampled monthly. It is assumed the requirement to sample SW152 monthly is an error in Appendix C, and this is only required to be sampled twice in wet season.
2. Table 1, Section 1.3 of the SAQP (AECOM, 2023b), note 7 on-base locations are to be sampled twice in wet season. However, Appendix C of the SAQP and Table 3, Section 2.1 of the Wet Season Sampling Event Factual Report, 2024 (AECOM, 2024b) both list only 6 locations to be sampled twice in the wet season. It is assumed Table 1 of the SAQP has seven listed in error, and only six locations are required to be sampled twice in wet season.

3.2 SUMMARY OF COMPLETED MONITORING JUNE 2023 – APRIL 2024

A summary of the monitoring completed in the reporting period is provided in Table 3-2 below. The groundwater, surface water and biota sampling locations are shown in Figure 2, Figure 3 and Figure 4, Appendix A, respectively.

Table 3-2: Summary of monitoring completed

Monitoring Events	Sampling dates	Number of samples required in SAQP	Number of samples collected
Biannual groundwater sampling – end of dry season and end of wet season	October and November 2023	34	28
	March 2024	34	34
Surface water off-base – twice in wet season	December 2023	14	14
	March 2024	14	14
Surface water off-base – monthly in wet season	December 2023	1	1
	January 2024	1	1
	February 2024	1	1

3.3 DEVIATIONS FROM THE SAQP

Deviations from the scope outlined in the SAQP (AECOM, 2023b) for the reporting period are summarised in Table 3-3 below.

Table 3-3: Summary of SAQP deviations

SAQP requirement	Deviation	Impact of deviation on data set
Surface water dry season sampling event (June 2023)		
Sampling of SW109 twice in dry season.	SW109 was not sampled in June 2023 as the sampling event was missed in error.	***Minor impact*** – data gap for June 2023 PFAS concentrations going off-base to Rapid Creek. It is noted that SW109 was sampled in the second dry season event (August 2023) and historical data is available for June in previous years.
Biannual groundwater sampling – end of dry season sampling event (October 2023)		
Sampling of 34 biannual groundwater locations at the end of dry season.	MW112 was not sampled due to runway upgrades. This location is suspected to be beneath earth works or destroyed during the upgrades.	***Minor impact*** – The lack of data in the monitoring event is considered to only have a minor impact on the understanding of concentration changes within the source area. These monitoring wells have previously been sampled in the dry season and there are other monitoring locations hydraulically down gradient of these locations (MW156 for MW112, MW454 for MW235) that were sampled as part of this sampling event. Whilst wells MW189 and MW191 are downgradient of FFTA2 well MW197, they do not provide relevant data associated with changes in the concentrations of PFAS within the source area. However, it is recognised that groundwater is rarely present in well MW197 during the dry season, and the majority of PFAS flux from this source area occurs during the wet season.
	MW235 (an alternative well for MW422 which was removed during the remediation works) was not sampled due to bent well casing, only gauging results were able to be recorded as no HydraSleeve™ was able to be deployed.	
	Both MW197 and the alternative monitoring location – MW236 – were dry and unable to be sampled.	
	MW240, MW241 and MW453 were both dry and unable to be sampled. No alternative locations are provided in the SAQP.	***Minor impact*** – It is recognised that groundwater is rarely present in wells MW240, MW241 and MW435 during the dry season, and the majority of PFAS flux from this source area occurs during the wet season. The lack of data in the monitoring event is considered to only have a minor impact on the understanding of concentration changes within the source area.
	MW128 was gauged and sampled at a later date (November 2023) due to a delay in obtaining gate keys from base Management.	***No impact*** – The sampling of MW128 in early November (9 November 2023) instead of October 2023 with the other monitoring locations is not considered to have an impact on the data as the wet season had not yet commenced with only one minor rain event (6 November 2023, 13.6 mm of rain)[1] prior to this sampling event. Therefore, groundwater conditions are still considered to reflect dry season conditions.
	MW422 was decommissioned prior to the sampling event as part of the FFTA1 remediation works.	***Minor impact*** – The lack of data in this well is considered to have a minor impact on the understanding of concentration changes in the source area as monitoring well MW502 was installed following the completion of the FFTA1 remediation within approximately two metres of the former location of MW422, and data from MW502 has been included in this OMR.
Water quality parameters – groundwater.	The water quality parameter data at MW205 for dissolved oxygen (DO) was lost due to an electronic data collection	***Minor impact*** – The lack of DO parameters for this well is considered to have minimal impact on the data set as DO does not influence the behaviour of PFAS in groundwater.

SAQP requirement	Deviation	Impact of deviation on data set
	fault where saved data was unable to be retrieved.	
	The water quality parameter data for MW128 was lost due to an electronic data collection fault where saved data was unable to be retrieved.	***Minor impact*** – The lack of water quality parameters for this well is considered to have minimal impact on the data set, as the interpretation of PFAS data from this well does not rely on water quality parameters.
Aquatic biota – end of dry season / start of wet season sampling event (November 2023)		
QA/QC for biota sampling.	A field blank as not collected during the biota sampling event.	***Minor impact*** – The accuracy of the data can be considered acceptable based on the available rinsate and trip blank samples that were reported at the required frequencies and within control limits as a part of the biota sampling (refer Section 4).
Monthly wet season surface water sampling events (December 2023 – April 2024)		
Three of four surface water locations to have flow readings and depth of water recorded. SW109 to have flow measurements recorded by a nearby stream gauge.	During the December 2023 sampling event, samples were collected at all four locations however flow readings and depth and width of water were not recorded.	***Notable impact*** – While concentration data from this sampling event will be useful for understanding PFAS impacts at the time of sample collection, the lack of flow and calculated volume data will limit the verification of flow volumes in evaluating PFAS mass flux calculations for Rapid Creek during this period.
Four surface water locations are to be sampled monthly.	During the April 2024 sampling event, samples were not collected from two of the nominated locations (SW312 and SW300) as they were dry.	***No impact*** – Only a total of 18.4 mm of rain was recorded at DIA in April 2024[1]. As PFAS mass flux in surface water only occurs during active flow events, PFAS mass flux calculations were not impacted as the lack of water demonstrated zero flux.
Water quality parameters are to be recorded for all surface water samples.	DO readings at SW170 were unable to be recorded due to water quality meter failure.	***Minor impact*** – Most of the DO readings from other locations were consistent with base conditions.
Biannual groundwater sampling – end of wet season sampling event (March 2024)		
Sampling of 34 biannual groundwater locations at the end of wet season.	MW112 was not sampled due to runway upgrades. This location is suspected to be beneath earth works or destroyed during the upgrades.	***Minor impact –*** As all other groundwater samples were collected from down-gradient locations, the lack of data for MW112 is only considered to have a minor impact on PFAS mobilisation and transport in the wet season.
	MW422 was decommissioned prior to the sampling event. Monitoring well MW502 was sampled in error as this was incorrectly believed by the sampling team to be the decommissioned MW422.	***No impact*** – MW502 is considered a replacement well for MW422. MW422 was decommissioned as part of the FFTA1 remediation works and MW502 was installed within the FFTA1 excavation footprint, as a replacement for MW422 and as such is considered an alternate well to meet the objectives of assessing PFAS mass flux within FFTA1 source area.
One rinsate blank sample to be collected per sampling day.	Only one rinsate blank sample was collected instead of two.	***Minor impact –*** AECOM (AECOM, 2024b) confirm all sampling equipment was either dedicated, disposal or decontaminated with a solution of water and Liquinox between sampling locations. The decontamination methods and field staff were consistent over the

SAQP requirement	Deviation	Impact of deviation on data set
		course of the sampling event. All reported groundwater sampling results were within expected concentration ranges.
One field blank per sampling day.	Only one field blank was collected instead of two.	***Minor impact*** – Field staff were consistent over the course of the sampling event and sampling and sample handling procedures remained consistent. Furthermore, field blanks have been below the laboratory limit of reporting (LOR) throughout the entire ongoing monitoring program (December 2019 to April 2024).
Twice in wet season surface water sampling events (December 2023 and March 2024)		
Biannual sampling of SW101.	Alternate sampling location (SW152) was sampled as SW101 has been made inaccessible through the installation of a security fence surrounding the airfield areas of RAAF Base Darwin.	***Minor impact*** – Due to the inaccessibility of SW101, the closest accessible point to collect surface water samples from upper Rapid Creek down gradient of the runway is SW152. This sample has been used as an alternative to SW101 since after April 2021. SW152 is located approximately 350 m south of SW101.
Water quality parameters are to be recorded for all surface water samples.	Water quality parameters failed to save during the December 2023 sampling event and as such data was lost for the following locations: • SW112 • SW113 • SW120 • SW109	***Minor impact –*** A minor data gap in water quality parameters exists for the December 2023 sampling event. This is considered to only have a minor impact on the results as the analytical results were consistent with historical data, and water quality data does exist for historical December sampling events. It is noted the water quality parameters and observations were accurately saved during the March 2024 sampling event.
24 surface water sampling locations were to be collected twice in the wet season.	Surface water location SW156 was dry during the March 2024 sampling event and therefore unable to be sampled.	***Minor impact*** – Downgradient sample location SW109 recorded PFAS concentrations within the expected range during the March 2024 sampling event, indicating it is unlikely that up-gradient locations, such as SW156, would be contributing higher than expected PFAS concentrations in the localised drainage system.

Notes:

1. Darwin weather station 014015, www.bom.gov.au, accessed 29/07/2024

3.4 CHANGES TO THE MONITORING NETWORK

Tetra Tech Coffey decommissioned monitoring well MW422 on 31 May 2022 as part of pre-remediation works at the FFTA1 source area. Once the remediation was complete at FFTA1, a replacement well MW502 was installed in the vicinity (within 2 m) of the former MW422 on 8 November 2023. This groundwater well is considered a replacement well for MW422 for the purpose of the ongoing monitoring program.

The locations of both former MW422 and replacement well MW502 are shown in Figure 2, Appendix A.

4. QUALITY ASSURANCE AND QUALITY CONTROL

AECOM implemented a QA/QC program as part of their field sampling procedures, based on relevant Australian Standards, Heads of Environment Protection Authority (HEPA) 2020 PFAS National Environmental Management Plan Version 2.0 (HEPA, 2020), (herein referred to as the PFAS NEMP) and industry practice. The implemented QA/QC program included the following:

- The use of appropriately qualified/trained environmental scientists to conduct the assessment.
- The use of standardised field records to document the findings of the assessment.
- Appropriate preservation of samples during transport from the field to the laboratory.
- The use of chain of custody documentation to ensure the traceability of sample transport and handling.
- The use of laboratories accredited by the National Association of Testing Authorities Australia (NATA) for the analysis of samples.
- The collection and analysis of field QC samples.
- Review of internal analysis of laboratory QC samples.
- The use of appropriate laboratory reporting limits.
- Compliance with sample holding times.
- Comparison of field and analytical data to check for the occurrence of apparently unusual or anomalous results.

A review of the QA/QC sampling measures implemented as a part of the sampling program has been undertaken to evaluate the precision and accuracy of the results and to assess whether the results can be relied on in drawing conclusions about the nature and extent of PFAS impacts in the Management Area.

AECOM undertook a review to validate the QA/QC results for each sampling event which included within the following factual reports provided in Appendix B:

- AECOM, Dry Season Sampling Event Factual Report 2023 (AECOM, 2024a)
- AECOM, Wet Season Sampling Event Factual Report, 2024 (AECOM, 2024b)

Tetra Tech Coffey has undertaken a review of the QA/QC results undertaken by AECOM as detailed below.

The steps in the sampling and analysis process are subject to natural and inherent variability, and this can affect the results produced, and the overall quality of the data sets generated. In order to minimise the effect of this, standard procedures are used for works carried out in the field, and in the laboratory. The use of such procedures represents one aspect of the quality assurance process. To measure the effectiveness of the QA process, QC samples can be tested, and other QC tests can be conducted during the analysis of samples taken in the field.

4.1 QUALITY ASSURANCE

Tetra Tech Coffey reviewed the quality assurance measures deployed by AECOM during the sampling events in this reporting period. A summary of the quality assurance measures, and outcomes of the review, is provided in Table 4-1 below.

Table 4-1: QA measures reviewed

Item	Detail	Yes	No	Comment
Sampling methodologies	Samples to be collected, and decontamination / avoidance of cross-contamination	☐	☒	Minor deviations to SAQP occurred, however these are not considered to have affected the integrity of the data

Item	Detail	Yes	No	Comment
	measures to be employed in accordance with approved SAQP (AECOM, 2023b).			collected. Further details on deviations are provided in Section 3.3.
Sample handling	All samples to be given a unique identified and labelled with relevant project details. All samples were placed in chilled, insulated coolers.	☒	☐	Some samples received at the laboratories exceeded the recommended temperature range of ≤ 6°C (up to 27.0°C). As key PFAS compounds analysed are not volatile, the samples were received below ambient water temperatures (~30°C) and samples were cooled immediately upon collection, this is not considered to affect the interpretation of results.
Frequency of QC samples	QC samples collected at a rate of 1 in 10 primary samples in accordance with PFAS NEMP.	☒	☐	
Rinsate samples	Rinsate samples to be prepared in the field using empty bottles and PFAS-free de-ionised water used for cleaning of non-disposable sampling equipment. Rinsate samples to be collected at a minimum rate,	☐	☒	One rinsate sample was not collected on 4 March 2024. The integrity of the data is not considered to have been compromised given the decontamination methods and field staff were consistent over the course of the sampling event. All reported groundwater sampling results collected on 4 March 2024 were within expected concentration ranges.

4.2 QUALITY CONTROL

QC samples and tests can be used to assess both the accuracy, and the precision of the results produced.

Measures of accuracy provide information on how close to the true result is the reported result. For practical reasons, measures of accuracy are usually confined to the laboratory steps in the overall process.

Measures of precision provide information on the variability in the results. Precision can be assessed as:

- “repeatability” or intra-laboratory variation – the degree of variation in a result when the same laboratory analyses a sample (or blind replicate) several times, and
- “reproducibility” or inter-laboratory variation – the degree of variation in a result when a different laboratory separately analyses a sample.

In addition, blank samples can be used to assess whether extraneous materials and factors have contributed to the results obtained from the sampling and analysis process.

4.2.1 Field quality control

Precision of the sample collection, transport and analysis process is measured by the relative percent difference (RPD) between duplicate results. Acceptance targets for duplicates are dependent on matrix type, contaminant type and contaminant concentrations. RPDs are considered acceptable where RPDs are less than 30% unless:

- Results are less than 10 times LOR – in which instance there is no limit, or
- Results less than 20 times the LOR have an RPD of less than 50%.

Results in this reporting period reported elevated RPDs above the acceptable control limits for perfluorooctane sulfonic acid (PFOS) for the following primary samples collected:

- **Dry Season Factual Report 2023**
  - MW144, RPD – 58% (inter-laboratory duplicate)
  - MW185, RPD – 77% (inter-laboratory duplicate)
  - SW109, August 2023, RPD – 70% (inter-laboratory duplicate)
- **Wet Season Factual Report, 2024**
  - MW144, RPD – 35% (inter-laboratory duplicate)
  - MW303, RPD – 38% (inter-laboratory duplicate)
  - MW156, RPD – 86% (inter-laboratory duplicate) (and PFHxS – 73%)
  - SW114, March 2024, RPD – 65% (inter-laboratory duplicate)

The review of the results of the QC replicate sampling indicated a good correlation between the intra-laboratory duplicate results (samples analysed at the primary laboratory), with some discrepancies noted for the inter-laboratory duplicate results (samples analysed at the secondary laboratory). Where RPD results were above the adopted screening criteria, they were assessed further. The results for the discrepancies indicated that the primary laboratory reported higher concentrations of PFOS (and other PFAS compounds) than the secondary laboratory, indicating the results from the primary laboratory are a conservative measure of the concentrations of PFAS in the sampled media.

Rinsate blanks, trip blanks and field blanks were collected as a part of the AECOM sampling program and analysed for PFAS. All results were below the laboratory reporting limits and indicate that the potential for cross-contamination between sampling locations, during sampling or during sample transport was low and acceptable.

The results from the Quality Control sampling were considered to indicate that the dataset could be relied on to assess risks to receptors and changes in concentrations as a part of this report.

4.2.2 Laboratory quality control

Laboratories are accredited by the NATA on the basis of their ability to provide quantitative evidence of their ability and competence to produce reliable results against recognised benchmarks NATA accredited laboratories are able to demonstrate the ability to produce reliable, repeatable results for a range of parameters within a range of sample matrices. Each laboratory method used undergoes a validation process before it is adopted by the laboratory and accredited by NATA. As part of the validation process, the precision and accuracy of the method are established.

In addition, laboratories conduct their own QC testing to indicate their performance on each reported batch of samples. The results of this testing are compared with the validated precision and accuracy.

Whilst there were some non-conformances, as detailed in the individual factual reports provided in Appendix B, the non-conformances have been reviewed and are not considered to impact on the integrity of the overall data collected during this reporting period.

4.3 SUMMARY

The QA/QC review process undertaken for this OMR included:

- Data integrity check – verifying the data is complete, accurate and consistent with established standards and procedures.
- Methodology review – ensuring the correct sampling and analytical methods were used.

- Validation of results – comparing the results with QA/QC criteria (such as RPDs and laboratory control limits) to confirm the data is within acceptable ranges.
- Identification of anomalies – checking for any errors or inconsistencies in the data and investigating causes.
- Documentation – ensuring all QA/QC procedures and findings are documented.

Following the review, Tetra Tech Coffey considers the data obtained during this reporting period, along with the historical data assessed, to be reliable, i.e., represent actual PFAS concentrations and site conditions at the time of monitoring and therefore be suitable for the understanding assessment of risk within the Management Area.

5. ASSESSMENT CRITERIA

Screening criteria used to assess the potential risks to receptors as a part of the monitoring program were sourced from the (HEPA, 2020)PFAS NEMP. The screening criteria in the PFAS NEMP were developed based on guidance provided in the following:

- Department of Health (DoH). Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (DoH, 2017a)
- DoH. Perfluorinated Chemicals in Food – Consolidated Report, April 2017 (DoH, 2017b)
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC, 2019)
- National Environment Protection (Assessment of Site contamination) Measure 1999 (ASC NEPM), Schedule B1, as amended ion 2013 (NEPC, 2013).

Adopted PFAS screening values for groundwater, surface water and aquatic biota are provided in Table 5-1 below.

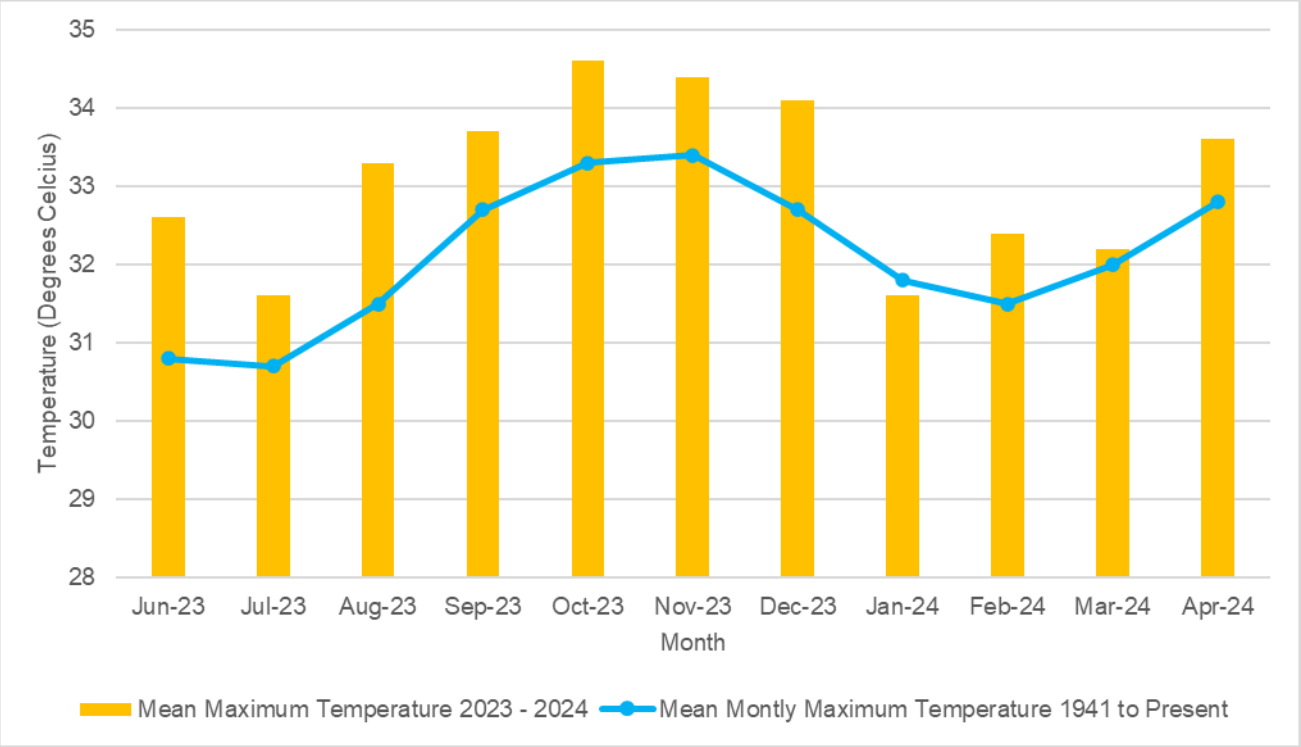
Table 5-1: PFAS screening criteria

Media		Compound	Criteria	Comment / Reference
Groundwater and surface water	Freshwater	PFOS	0.00023 µg/L	HEPA (2020) NEMP 99% species protection.
		Perfluorooctanoic acid (PFOA)	19 µg/L	
Groundwater	Drinking water	PFOS+ Perfluorohexane sulfonic acid (PFHxS) [1,2]	0.07 µg/L	The values presented in the HEPA (2020) are from DoH 2017a. DoH utilised the tolerable daily intake for PFOS and PFOA from Food Standards Australia New Zealand (FSANZ), 2017 and the methodology described in Chapter 6.3.3 of NHMRC Australian Drinking Water Guidelines, 2016 to establish drinking water values.
		PFOA	0.56 µg/L	
Surface water	Recreational use	PFOS+PFHxS[1]	2 µg/L	The values presented in HEPA (2020) were based on NHMRC guidance on the assessment of PFAS in surface water. The NHMRC adjusted the ingestion rate with consideration of an event frequency (150 events / year) to calculate an annual ingestion rate of 30 L per year.
		PFOA	10 µg/L	
Aquatic biota	Crustaceans	PFOS and PFOS+PFHxS	65 µg/kg	The values are presented in (DoH, 2017b) derived for the projection of children 2 to 6 years old, medium consumption.
		PFOA	520 µg/kg	
	Finfish	PFOS and PFOS+PFHxS	5.2 µg/kg	The values are presented in (DoH, 2017b) derived for the projection of children 2 to 6 years old, P90 consumption.
		PFOA	41 µg/kg	

Notes:
1. HEPA (2020) notes where the criteria refer to the PFOS+PFHxS, this includes PFOS only, PFHxS only, and the sum of the two
2. PFOS+PFHxS relates to the sum of PFOS and PFHxS

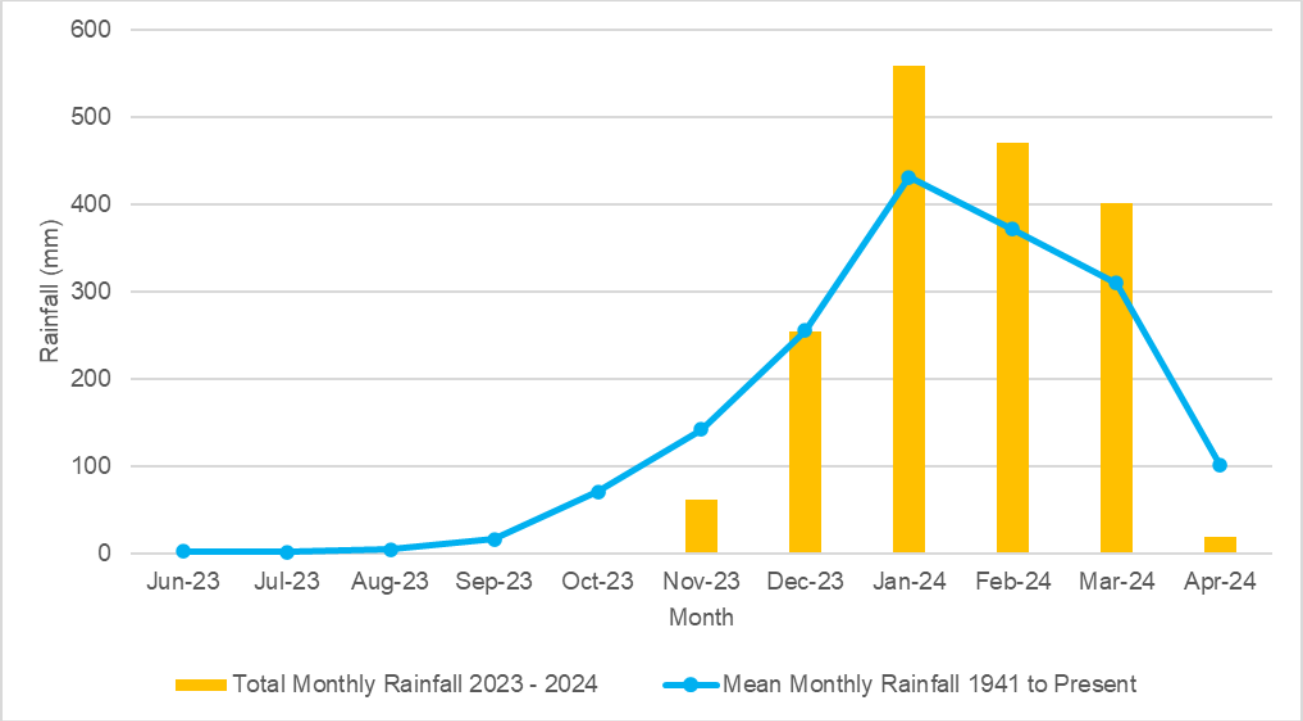
6. CLIMATE

The reporting period between June 2023 and April 2024 was characterised by above average temperatures in all months, except for January 2024 which reported an average temperature slightly (0.2 °C) below the long-term average. A graph of monthly reported maximum temperatures alongside the long-term average is shown in Graph 6-1.

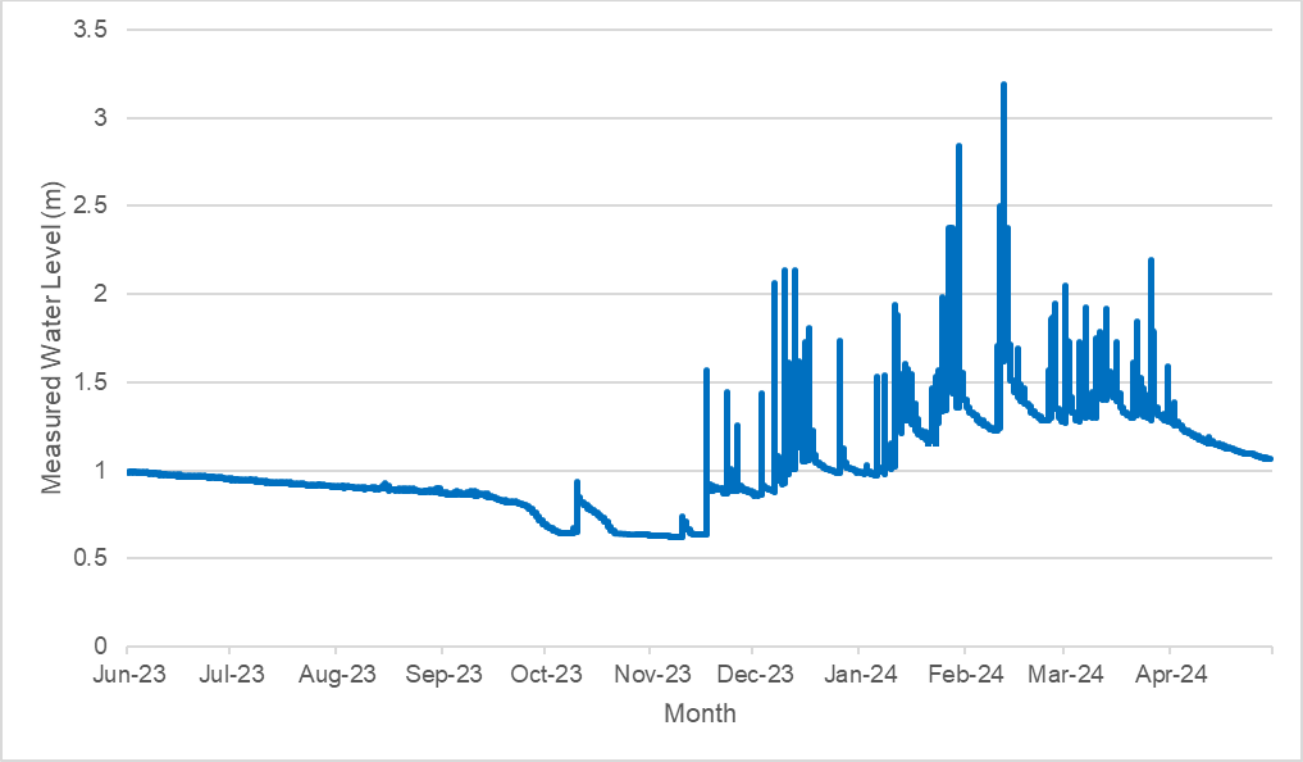


Graph 6-1: Average monthly maximum temperatures (June 2023 – April 2024) vs long-term average monthly maximum temperature (Darwin Airport, station ID 014015) (BOM, 2024)

Monthly rainfall during the months of June to November 2023 was below the long-term average, with rainfall increasing to match the average in December, followed by higher-than-average rainfall in the early months of 2024 (January to March). Rainfall reported in April was below average, indicating an early end to the 2023 / 2024 wet season. A graph of monthly reported rainfall and the long-term average is shown in Graph 6-2. Water levels recorded in Rapid Creek at McMillans Road throughout the reporting period align with reported rainfall. Water levels at the recording gauge began increasing from November 2023, recording the highest levels around late January / early February 2024 and started to decline in early April 2024 (refer Graph 6-3). The wettest month during this wet season was January 2024, however the maximum water level measurement at Rapid Creek (3.002 to 3.189 mm) occurred on 12 February 2024. This day coincided with the highest rainfall recorded during this wet season with 177.7 mm recorded on that day.



Graph 6-2: Total monthly rainfall (June 2023 – April 2024) vs long-term average monthly rainfall (Darwin Airport, station ID 014015) (BOM, 2024)



Graph 6-3: Rapid Creek water level (downstream at McMillans Road – station ID G8150127), June 2023 to April 2024 (BOM, 2024)

The first wet season surface water event of this reporting period occurred in December 2023, which targeted (as soon as practicable) the start of the higher rainfall period. This is because as the end-of-dry-season / start-

of-wet-season is normally characterised by spikes in surface water concentrations (i.e., “first-flush” sampling). Given the below average rainfall in November 2023, the sampling in December 2023 is considered to have functioned as the first-flush event for this wet season.

7. MONITORING DATA SUMMARY

A summary of monitoring completed in this reporting period is provided in Table 3-2, Section 3.2. Groundwater, surface water and biota sampling locations are shown in Figure 2, Figure 3 and Figure 4 (Appendix A), respectively. A detailed analysis of these results is provided in Section 8.

The monitoring events completed during this reporting period have been reported in the following factual reports:

- AECOM, Dry Season Sampling Event Factual Report 2023 (AECOM, 2024a) includes monitoring events in:
  - June 2023 – *Note: no sampling was completed in June 2023, however the lack of sampling in this month is discussed in this factual report*
  - August 2023
  - October 2023[2]
- AECOM, Wet Season Sampling Event Factual Report, 2024 (AECOM, 2024b) includes monitoring events in:
  - December 2023
  - January 2024
  - February 2024
  - March 2024
  - April 2024

7.1 GROUNDWATER RESULTS

7.1.1 Monitoring well network condition

Much of the monitoring well network was observed to be in good condition with the following exceptions:

- Contingency well MW235 requires casing to be corrected or well reinstated.
- MW112 is either buried by earthworks being conducted in the area (runway upgrade) or has been destroyed. If location cannot be rectified in future events, replacement may be required.

7.1.2 Groundwater field observations

The field observations recorded during the groundwater monitoring events (GMEs) (October 2023 and March 2024), including groundwater elevation and water quality parameters are provided in Table C1, Appendix C and summarised in Table 7-1 below.

Table 7-1: Groundwater field observations summary

	End of dry season	End of wet season
Factual report	AECOM, 2024a	AECOM, 2024b
Sample dates	30 and 31 October 2023 and 9 November 2023	4, 5 and 20 March 2024

[2] As outlined in Table 3-3, Section 3.3, MW128 was sampled on 9 November due to delay in obtaining access to this well, however for the purposes of this report is considered to be part of the October GME.

	End of dry season	End of wet season
Colour	Groundwater colour was not recorded during this GME.	Groundwater in MW176, MW209 and MW215 were observed to be brown. Groundwater in MW185, MW191, MW200 and MW454 were observed to be light brown. All other wells were observed to be colourless.
Turbidity	High turbidity at the bottom of the Hydrasleeve™ was observed at MW103, MW107, MW148, MW176, MW180, MW190, MW209, MW210, MW215, MW452 and MW454. Moderate turbidity was observed at MW115, MW139, MW144, MW185, MW191, MW200, MW205, MW211, MW303 and MW451. Low turbidity was observed at MW133, MW141, MW156 and MW297.	Observations around turbidity was not recorded for most wells. Low turbidity was recorded for MW115, MW156, MW197, MW205 and MW456.
Odour	A strong hydrocarbon odour was observed at MW133, MW297 and MW303.	A hydrocarbon odour was observed in wells MW133 and MW292. A strong hydrocarbon odour was observed in wells MW241 and MW297. A 'slight odour' was recorded at MW197 – no further description of the odour was provided.
Other observations	Wells MW197, MW234, MW240, MW241 and MW453 were dry.	No sheen was observed in any wells.

7.1.3 Groundwater elevation

The standing water level (SWL) was gauged in all wells prior to sampling (measured in metres below top of casing (m BTOC) and converted to groundwater elevations in m AHD). The groundwater gauging results are presented in Table C1, Appendix C and summarised in Table 7-2 below.

Table 7-2: Summary of groundwater elevations

Sampling Event	No. Wells	Min. SWL	Max. SWL	Min. SWL	Max. SWL
		m BTOC	m BTOC	m AHD	m AHD
Dry season (October – November 2023)	27	2.089 (MW190)	12.748 (MW180)	2.508 (MW185)	20.652 (MW200)
Wet season (March 2024)	33	0.473 (MW185)	4.212 (MW211)	4.993 (MW210)	25.055 (MW180)

7.1.4 Groundwater flow directions

The groundwater elevation data are tabulated in Table C1, Appendix C. Inferred groundwater contours and flow directions from the October 2023 GME and from the March 2024 GME are presented in Figure 5A and Figure 5B, (Appendix A), respectively.

A localised groundwater high point was recorded in both GMEs in the centre of the base (south of the main runway), and the groundwater flow direction radiates from this location, flowing in an arc from north to west towards Rapid Creek and Ludmilla Creek respectively. Groundwater to the south of the base flows towards Charles Darwin National Park and Francis Bay. The groundwater contours are consistent with the DSI

(Coffey, 2018a) and Supplementary DSI (Coffey, 2018d) flow directions and those of previous monitoring events completed since 2019.

7.1.5 Groundwater quality field measurements

Groundwater quality field measurements recorded during sampling are tabulated in Table C1, Appendix C. A summary of maximum and minimum field parameters for this reporting period, along with historical maximum and minimums for the nominated OMP wells is presented in Table 7-3 below.

Table 7-3: Groundwater quality parameter ranges

	Historical (April 2017 to March 2023)	Dry season (October to November 2023)	Wet season (March 2024)
No. of samples	376	27	28
Dissolved Oxygen (mg/L)	0.07 (MW303) to 5.20 (MW180) *Poor to moderately oxygenated conditions*	0.84 (MW303) to 4.68 (MW115) *Poor to moderately oxygenated conditions*	0.95 (MW297) to 5.28 (MW180) *Poor to moderately oxygenated conditions*
Electrical Conductivity (µS/cm)	23.6 (MW194) to 63,307 (MW201) *Freshwater to saline conditions*	41.2 (MW239) to 1,794 (MW209) *Freshwater to slightly saline conditions*	2.1 (MW211) to 1,622 (MW209) *Freshwater to slightly saline conditions*
pH	3.9 (MW241) to 8.6 (MW115) *Acidic to mildly basic conditions*	4.22 (MW180) to 5.65 (MW303) *Acidic to moderately acidic conditions*	4.66 (MW115) to 6.33 (MW451) *Acidic to slightly acidic conditions*
Corrected redox[1] (mV)	130.8 (MW241) to 500 (MW139) *Oxidising conditions*	188.1 (MW303) to 417.1 (MW209) *Oxidising conditions*	213.6 (MW297) to 395.9 (MW141) *Oxidising conditions*
Temperature (°C)	26.5 (MW144) to 43.94 (MW148)	29.5 (MW156) to 33.7 (MW180)	28.7 (MW133) to 33.3 (MW180)

Note:

1. Corrected redox - – Redox is measured as the electrical response from a standard hydrogen electrode (SHE). However, SHEs are not practicable to use outside of a laboratory, and alternative electrodes are used for field measurements. The results from a field electrode have been converted to SHE units by applying a ratio specific to the field electrode used and the temperature of the water measured. .

7.1.6 Groundwater PFAS analytical results

The groundwater analytical results, including historical results, are presented in Table C2, Appendix C. Groundwater sampling locations are shown in Figure 2, Appendix A.

A summary of PFOS+PFHxS and PFOA concentrations in this reporting period are provided in Table 7-4 below and presented in Figure 6A and Figure 6B (Appendix A), respectively.

Deviations from the historical groundwater dataset are summarised in Table 7-5. MW502 was first installed within the reporting period and no historical data is available for this well.

Table 7-4: Summary of PFOS, PFOS+PFHxS and PFOA concentrations in groundwater

Sampling Event	No. of Samples[1]	Analyte	Concentration Range (µg/L)	No. samples > LOR[1]	No. samples > Human Health Criteria[1]	No. samples > Ecological Criteria[1,2]
End of dry season (October 2023)	28	PFOS	<0.01 (Multiple) to 201 (1302_MW115_231031)	26	*n/a*[3]	26
		PFOS+PFHxS	<0.01 (Multiple) to 228.0 (1302_MW115_231031)	26	25	*n/a*[3]
		PFOA	<0.01 (Multiple) to 2.78 (1302_MW303_231030)	21	4	0
End of Wet season (March 2024)	43	PFOS	<0.01 (1302_MW209_240305) to 51.0 (1302_MW115_240320)	42	*n/a*[3]	42
		PFOS+PFHxS	<0.01 (1302_MW209_240305) to 66.9 (1302_MW115_240320)	42	42	*n/a*[3]
		PFOA	<0.01 (Multiple) to 2.60 (1302_MW240_240320)	29	8	0

Notes:

1. All samples (primary and duplicates)
2. As ecological criteria is below laboratory LOR, only samples above the LOR have been included.
3. *n/a* indicates that there are no criteria for the relevant analyte.

Table 7-5: Deviations from historical groundwater dataset

Deviation	PFOS			PFOS+PFHxS (Sum)			PFOA		
First time detections	*None*			*None*			*None*		
New exceedances of ecological criteria[1]	*None*			*n/a[3]*			*None*		
New exceedances of human health[2] criteria	*n/a[3]*			*None*			*None*		
New minimums	**Sample**	**New min.**	**Previous min.**	**Sample**	**New min.**	**Previous min.**	**Sample**	**New min.**	**Previous min.**
	MW107 (05/03/2024)	4.51 µg/L	5.4 µg/L (09/03/2024)	MW107 (05/03/2024 & 30/10/2023)	6.24 µg/L & 8.15 µg/L	8.46 µg/L (09/03/2024)	MW107 (05/03/2024 & 30/10/2023)	0.13 µg/L & 0.14 µg/L	0.15 µg/L (16/12/2019)
	MW128 (20/03/2024)	2.3 µg/L	2.7 µg/L (07/03/2022)	MW128 (20/03/2024)	3.4 µg/L	3.68 µg/L (07/03/2022)	MW240 (04/03/2024 & 20/03/2024)	2.44 µg/L & 2.6 µg/L	2.8 µg/L (08/05/2018)
	MW297 (04/03/2024)	1.06 µg/L	1.07 µg/L (08/03/2022)	MW297 (04/03/2024)	1.42 µg/L	1.44 µg/L (08/03/2022)	MW144 (19/03/2024)	0.02 µg/L	0.026 (20/04/2023)
	MW139 (05/03/2024 & 18/03/2024)	0.21 µg/L & 0.25 µg/L	0.27 µg/L (09/03/2022)	MW139 (05/03/2024 & 18/03/2024)	0.3 µg/L & 0.34 µg/L	0.41 µg/L (09/03/2022)	MW197 (19/03/2024)	0.08 µg/L	0.11 (11/01/2018)
	MW240 (20/03/2024 & 04/03/2024)	14.0 µg/L & 14.4 µg/L	16.0 µg/L (08/05/2018)	MW240 (04/03/2024)	19.6 µg/L	20.0 (08/05/2018)			
	MW451 (30/10/2023)	<0.01 µg/L	0.02 µg/L (10/12/2020)	MW451 (30/10/2023)	<0.01 µg/L	0.02 µg/L (10/12/2020)			
	MW452 (18/03/2024 & 05/03/2024)	1.3 µg/L & 1.74 µg/L	1.86 µg/L (08/03/2022)	MW452 (18/03/2024)	1.95 µg/L	2.75 µg/L (08/03/2022)			
	QC201[4] (31/10/2023)	<0.01 µg/L	0.05 µg/L (28/04/2021)	MW200 (05/03/2024)	0.5 µg/L	0.61 µg/L (08/03/2022)			

Deviation	PFOS			PFOS+PFHxS (Sum)			PFOA		
	MW200 (05/03/2024)	0.3 µg/L	0.36 µg/L (08/03/2022)	MW194 (31/10/2023)	2.51 µg/L	2.6 µg/L (06/05/2022)			
	MW194 (31/10/2023)	1.78 µg/L	1.83 µg/L (06/05/2021)	MW197 (19/03/2024)	5.69 µg/L	6.3 µg/L (07/09/2017)			
New maximums	*None*			*None*			*None*		

Notes:

1. Human health criteria for groundwater denotes drinking water guidelines (PFAS NEMP 2.0 (HEPA, 2020))
2. As ecological criteria is below laboratory LOR, only samples above the LOR have been included.
3. *n/a* indicates that there are no criteria for the relevant analyte
4. The primary sample MW176 reported a concentration of 0.07 µg/L (exceeding the PFOS ecological criteria).
5. Duplicate of MW128.

7.2 SURFACE WATER

7.2.1 Surface water field observations

The field observations during surface water sampling are provided in Table C3, Appendix C, and summarised in Table 7-6 below.

Table 7-6: Surface water field observations summary

	Dry season	Wet season
Factual report	AECOM, 2024a	AECOM, 2024b
Clarity	*n/a – not recorded*	Low to high clarity
Colour	Colourless	Colourless to brown
Flow	*n/a – not recorded*	No flow to high flow
Turbidity	Moderate turbidity	*n/a – not recorded*
Odour	No odour	No odour
Sheen	Organic sheen observed	No sheen to organic sheen

7.2.2 Surface water quality field measurements

Surface water quality field measurements recorded during sampling are tabulated in Table C3, Appendix C. A summary of the maximum and minimum water quality field parameters for the reporting period, along with historical maximum and minimums is presented in Table 7-7 below.

Table 7-7: Surface water quality parameter ranges

Event	No. of samples	Dissolved Oxygen (mg/L)	Electrical Conductivity (µS/cm)	pH	Corrected redox[1] (mV)	Temperature (°C)
Historical	95	0.01 (SW124) to 7.50 (SW112) *Poor to oxygenated conditions*	19.5 (SW115) to 71,652.0 (SW120) *Freshwater to saline conditions*	4.98 (SW114) to 9.55 (SW133) *Acidic to basic conditions*	102.4 (SW300) to 422.8 (SW108) *Oxidising conditions*	26.1 (SW113) to 33.9 (SW168)
Monthly and start of wet season (December 2023)	17	1.57 (SW160) to 10.35 (SW125) *Poor to oxygenated conditions*	9.5 (SW181) to 580.27 (SW124) *Freshwater conditions*	5.34 (SW108) to 9.16 (SW125) *Acidic to basic conditions*	202.6 (SW114) to 286.8 (SW133) *Oxidising conditions*	26.1 (SW162) to 32.5 (SW115 & SW168)
January 2024 (monthly wet season)	3	5.94[2] (SW170) to 8.75[2] (SW109) *Oxygenated conditions*	52.3 (SW170) to 85.7 (SW109) *Freshwater conditions*	6.8 (SW170) to 7.6 (SW109) *Slightly acidic to slightly basic conditions*	256.6 (SW109) to 293.3 (SW170) *Oxidising conditions*	26.8 (SW312) to 27.4 (SW109)
February 2024 (monthly wet season)	3	4.15 (SW170) to 5.67 (SW312) *Moderately oxygenated conditions*	30.4 (SW312) to 49.0 (SW170) *Freshwater conditions*	5.81 (SW170) to 7.96 (SW312) *Slightly acidic to slightly alkaline conditions*	*Not collected*	29.1 (SW109) to 33.5 (SW312)
Monthly and end of wet season (March 2024)	22	0.53 (SW160) to 5.16 (SW12) *Poor to oxygenated conditions*	27.6 (SW312) to 42,836 (SW124) *Freshwater to brackish conditions*	5.38 (SW168) to 8.5 (SW125) *Acidic to basic conditions*	291.1 (SW109) to 380.2 (SW124) *Oxidising conditions*	28 (SW178) to 31.2 (SW168)
Dry season (April 2024)	2	2.48 (SW109) *Moderately oxygenated conditions*	49.3 (SW109) to 83.6 (SW170) *Freshwater conditions*	4.82 (SW170) to 5.81 (SW109) *Acidic conditions*	372.4 (SW170) to 357.6 (SW109) *Oxidising conditions*	28.4 (SW170) to 28.9 (SW109)

Note:

1. Corrected redox – Corrective relative to the potential of the SHE (as detailed in the note to Table 7-3).
2. Conversion made from DO% (Sat) to mg/L using USGS on-line calculator (https://water.usgs.gov/cgi-bin/dotables), BoM barometric pressure from 24/01/2024 and the machine reading for temperature and electrical conductivity.

7.2.3 Surface water PFAS analytical results

The surface water analytical results, including historical results, are presented in Table C4, Appendix C. Surface water sampling locations are shown in Figure 3, Appendix A.

A summary of PFOS, PFOS+PFHxS and PFOA concentrations in this reporting period (i.e., are provided in Table 7-8 below and presented in Figure 7A and Figure 7B, Appendix A, respectively.

Deviations from the historical surface water dataset are summarised in Table 7-9.

Table 7-8: Summary of PFOS, PFOS+PFHxS and PFOA concentrations in surface water

Sampling Event	No. of Samples[1]	Analyte	Concentration Range (µg/L)	No. samples > LOR[1]	No. samples > Human Health Criteria[1]	No. samples > Ecological Criteria[1,2]
Dry season (August 2023)	3	PFOS	0.53 (1302_QC200_230830)[3] to 1.1 (1302_SW109_230803)	3	*n/a*[4]	3
		PFOS+PFHxS	1.11 (1302_QC200_230830)[3] to 1.84 (1302_SW109_230803)	3	0	*n/a*[4]
		PFOA	0.021 (1302_QC200_230830)[3] to 0.04 (1302_QC100_230803)[5]	3	0	0
Monthly and start of wet season (December 2023)	23	PFOS	<0.01 (Multiple) to 1.06 (1302_SW168_231206)	19	*n/a*[4]	19
		PFOS+PFHxS	<0.01 (Multiple) to 1.72 (1302_SW168_231206)	19	0	*n/a*[4]
		PFOA	<0.01 (Multiple) to 0.05 (1302_SW168_231206)	8	8	8
January 2024 (monthly wet season)	3	PFOS	0.029 (1302_QC200_240124)[6] to 0.21 (1302_SW109_240124)	3	*n/a*[4]	3
		PFOS+PFHxS	0.029 (1302_QC200_240124)[6] to 0.32 (1302_SW109_240124)	3	1	*n/a*[4]
		PFOA	<0.01 (Multiple)	0	0	0
February 2024 (monthly wet season)	3	PFOS	0.26 (1302_SW109_240215) to 0.66 (1302_QC100_240215)[7]	3	*n/a*[4]	3
		PFOS+PFHxS	0.38 (1302_SW109_240215) to 0.94 (1302_QC100_240215)[7]	3	0	0
		PFOA	<0.01 (Multiple) to 0.02 (1302_SW170_240215)	1	0	0
Monthly and end of wet season (March 2024)	22	PFOS	<0.01 (1302_SW115_240306) to 3.2 (1302_SW312_240306)	21	*n/a*[4]	21
		PFOS+PFHxS	<0.01 (1302_SW115_240306) to 3.74 (1302_SW114_240306)	21	4	*n/a*[4]
		PFOA	<0.01 (Multiple) to 0.09 (1302_SW125_240306)	11	0	0
Dry season (April 2024)	1	PFOS	0.54 (1302_SW109_240430)	1	*n/a*[4]	1
		PFOS+PFHxS	0.82 (1302_SW109_240430)	1	0	*n/a*[4]

Sampling Event	No. of Samples[1]	Analyte	Concentration Range (µg/L)	No. samples > LOR[1]	No. samples > Human Health Criteria[1]	No. samples > Ecological Criteria[1,2]
		PFOA	0.01 (1302_SW109_240430)	1	0	0

Notes:

1. All samples (primary and duplicates).
2. As ecological criteria is below laboratory LOR, only samples above the LOR have been included.
3. Triplicate (Inter-Laboratory) sample paired with primary sample 1302_SW109_230830.
4. *n/a* indicates that there are no criteria for the relevant analyte.
5. Duplicate (Intra-Laboratory) sample paired with primary sample 1302_SW109_230830.
6. Triplicate (Inter-Laboratory) sample paired with primary sample 1302_SW312_240124.
7. Duplicate (Intra-Laboratory) sample paired with primary sample 1302_SW170_240215.

Table 7-9: Deviations from historical surface water dataset

Deviation	PFOS			PFOS+PFHxS (Sum)			PFOA		
First time detections	*None*			*None*			*None*		
New exceedances of ecological criteria[1]	*No*			*n/a[3]*			*No*		
New exceedances of human health criteria[2]	*n/a[3]*			*No*			*No*

	QC200[5] (24/01/2024)	0.03 µg/L	0.1 µg/L (13/12/2023)	QC200[5] (24/01/2024)	0.04 µg/L	0.73 µg/L (22/12/2022)			
	SW106 (06/12/2023)	0.04 µg/L	0.14 µg/L (12/11/2021)	SW106 (06/12/2023)	0.06 µg/L	0.25 µg/L (12/11/2021)			
	SW109 (24/01/2024)	0.21 µg/L	0.26 µg/L (21/02/2023)	SW108 (06/03/2024)	0.52 µg/L	0.54 µg/L (21/01/2020)			
	SW132 (06/12/2023)	0.01 µg/L	0.03 µg/L (23/01/2020)	SW109 (24/01/2024)	0.32 µg/L	0.36 µg/L (21/02/2023)			
				SW132 (06/12/2023)	0.01 µg/L	0.03 µg/L (23/01/2023)			
New maximums	**Sample**	**New max.**	**Previous max.**	**Sample**	**New max.**	**Previous max.**	**Sample**	**New max.**	**Previous max.**
	SW160 (06/03/2024)	0.32 µg/L	0.26 µg/L (25/12/2022)	SW160 (06/03/2024)	0.48 µg/L	0.31 µg/L (25/11/2022)	SW170 (15/02/2024)	0.02 µg/L	0.01 µg/L (06/04/2022)

Notes:

1. Human health criteria for surface water denotes recreational guidelines (PFAS NEMP 2.0 (HEPA, 2020))
2. As ecological criteria is below laboratory LOR, only samples above the LOR have been included.
3. *n/a* indicates that there are no criteria for the relevant analyte.
4. QC201 is an Inter-Laboratory (Triplicate) sample with the primary sample being 1302_SW152_231214.
5. QC200 is an Inter-Laboratory (Triplicate) sample with the primary sample being 1302_SW312_230124.

7.3 AQUATIC BIOTA

Aquatic biota (edible fish, crustaceans and molluscs) monitoring is conducted once per year at the end of the dry season within the Management Area in Ludmilla Creek and Rapid Creek. The monitoring data is used to assess changes in PFAS concentrations in aquatic biota over time and confirm ongoing relevance of data used to inform the Northern Territory Department of Health (NT Health).

All locations nominated in the SAQP for biota sampling were sampled in this reporting period.

The aquatic biota results for the reporting period are presented in Table C5, Appendix C and locations shown in Figure 4, Appendix A.

The PFOS, PFOA and PFOS+PFHxS concentrations for the reporting period are summarised in Table 7-10 below.

Table 7-10: Summary of PFOS, PFOS+PFHxS and PFOA concentrations in biota

Sampling Event	No. of Samples[1]	Analyte	Concentration Range (mg/kg)	No. samples > LOR	No. samples exceeding criteria for finfish (all species)	No. samples exceeding criteria for crustaceans (all species)
BIO007 – Rapid Creek mouth						
October 2023	23 finfish samples	PFOS	<0.0003 to 0.084	20	12	*n/a*[2]
		PFOS+PFHxS	<0.001 to 0.084	20	12	*n/a*[2]
		PFOA	<0.0001 to 0.00015	1	0	*n/a*[2]
BIO016 – Ludmilla Creek (estuarine area)						
October 2023	5 invertebrate samples	PFOS	0.008 to 0.018	5	*n/a*[2]	0
		PFOS+PFHxS	0.008 to 0.018	5	*n/a*[2]	0
		PFOA	<0.0001 to 0.009	3	*n/a*[2]	0
BIO018 – Ludmilla Creek boat ramp						
October 2023	19 finfish samples, 3 crustacean samples	PFOS	<0.0003 to 0.011	14	2	0
		PFOS+PFHxS	<0.008 to 0.011	14	2	0
		PFOA	<0.0001 to 0.001	1	*n/a*[2]	0
BIO024 – Rapid Creek freshwater – upstream of Trower Road						
October 2023	3 crustacean samples	PFOS	0.015 to 0.059	3	*n/a*[2]	0
		PFOS+PFHxS	0.02 to 0.074	3	*n/a*[2]	1
		PFOA	<0.0001 to 0.001	1	*n/a*[2]	0
BIO026 – Rapid Creek freshwater – upstream of Trower Road						
October 2023	4 crustacean samples	PFOS	0.02 to 0.37	4	*n/a*[2]	1
		PFOS+PFHxS	0.027 to 0.42	4	*n/a*[2]	1
		PFOA	<0.0001	0	*n/a*[2]	0

Sampling Event	No. of Samples[1]	Analyte	Concentration Range (mg/kg)	No. samples > LOR	No. samples exceeding criteria for finfish (all species)	No. samples exceeding criteria for crustaceans (all species)
BIO028 – Rapid Creek freshwater – upstream of Trower Road						
October 2023	3 crustacean samples	PFOS	0.023 to 0.058	3	*n/a*[2]	0
		PFOS+PFHxS	0.031 to 0.078	3	*n/a*[2]	1
		PFOA	<0.0001 to 0.01	1	*n/a*[2]	0

Notes:

1. All samples (primary and duplicates)
2. *n/a* indicates that there are no criteria for the relevant analyte.

8. INTERPRETIVE ANALYSIS

In addition to reporting period data, historical data from 2017 to 2023 was included in the assessment to analyse temporal trends. The historical data was obtained from the historical documents as outlined in Section 1.3 of this report.

Where sufficient data was available, Mann-Kendall statistical analysis has been used to assess trends at individual monitoring locations. Where a location appears to be seasonally influenced, and where there is sufficient dataset, the Mann-Kendall statistical analysis was undertaken for the separated wet season and dry season datasets.

For surface water, in addition to Mann-Kendall analysis (where there was sufficient data), temporal trend assessment of scatter plots presenting concentrations against daily rainfall averages was also carried out.

8.1 HYDROGEOLOGY

Historical and recent groundwater elevations recorded during GMEs undertaken are presented in Table C1, Appendix C with inferred groundwater contours and flow directions presented in Figure 5A and Figure 5B, Appendix A respectively.

Groundwater levels fluctuate over wet and dry seasons, with the highest groundwater levels recorded in late wet season and lowest groundwater levels in late dry season.

Groundwater levels have been reported to fluctuate by over 13.5 metres between late wet and late dry seasons in the CFTA source area (i.e., at MW453, noting the fluctuation is listed as over 13.5 m as the groundwater well was dry during wet season so the water level beneath the base of the well, i.e., 15 m bgl is not known). Other groundwater wells in that area, MW240 and MW241 were also dry during dry season and based on depths of these wells, i.e.,14.5 m bgl, the groundwater fluctuation in these wells was over 12.4 m between wet and dry seasons.

Groundwater levels fluctuated by less than 1 metre between wet and dry seasons adjacent to Rapid Creek (MW191, MW190(MW201, MW452 and MW128). Monitoring well MW191 recorded the lowest fluctuation of 0.106 m between the highest and lowest groundwater level recorded.

Inferred groundwater flow during the reporting period at the base follows localised topography and is consistent with what was reported in the DSI (Coffey, 2018a) and Supplementary DSI (Coffey, 2018d). Groundwater flows:

- to the north (towards Rapid Creek) from the southern side of the main runway,
- to the south (towards Sadgroves and Reichardt Creeks) in the south of the base, and
- to the west and southwest (towards Ludmilla Creek) in the southwest of the base.

8.2 GROUNDWATER RESULTS

The highest PFAS concentrations for GMEs conducted during the monitoring period (October 2023 and March 2024) were detected within PFAS source areas, in line with the CSM. Specifically, the maximum concentrations of PFOS+PFHS reported during the monitoring period were:

- Former ARFF Fire Station: 228 µg/L and 66.9 µg/L at MW115 (October 2023 and March 2024 respectively), and
- FFF4: 93.7 µg/L at MW303 (October 2023).

Historically, MW422 reported some of the highest concentrations of PFOS+PFHxS (328 µg/L in March 2022). This groundwater well was decommissioned as part of the FFTA1 remediation works, and replacement well MW502 was installed within the source area after the completion of the remediation works (Tetra Tech Coffey, 2024). MW502 has been sampled once and reported a PFOS+PFHxS concentration of 6.96 µg/L. Groundwater well MW502 was installed with the same well screening as MW422 (i.e. screened from 1 m bgl to depth of well).

Groundwater well MW240, located in CFTA, also historically reported elevated PFOS+PFHxS concentrations at 102 µg/L in November 2020, at the end of dry season GME (when the groundwater levels were lowest). As this groundwater well has been dry at the end of all subsequent dry seasons, the groundwater concentrations in that source area at the end of the dry season has not been analysed.

As also reported in the previous Ongoing Monitoring Interpretive Report, (AECOM, 2023a), PFOS, PFOA and/or PFHxS concentrations were detected in monitoring wells down-hydraulic gradient from the identified PFAS source areas and indicates that groundwater impacts are migrating from these sources.

The maximum PFOS+PFHxS concentrations outside PFAS source areas were reported at:

- MW210, located within the residential area of Ludmilla, located west of the base (3.29 µg/L in October 2023), and
- MW194, located on the northwestern boundary of the base, adjacent to Rapid Creek (2.68 µg/L in March 2024).

Concentrations of PFOS, PFHxS and/or PFOA did not exceed previous maximum concentrations in any groundwater wells in this reporting period. New minimums were reported at fourteen locations during this reporting period, namely:

- ten locations for new PFOS minimums,
- thirteen locations for new PFOS+PFHxS minimums, and
- six locations for new PFOA minimums.

Refer to Table 7-5, Section 7.1.6 for a summary of new minimums. Most of the PFAS concentrations in groundwater monitoring locations were within historical ranges, however some decreases in concentrations were reported. The new minimums were reported for at least one analyte in each region of the base (refer to Table 8-1, Section 8.3.1 for a summary of wells in regions across the base).

8.3 GROUNDWATER TRENDS

8.3.1 Overview

Groundwater analytical results are presented in Table C2, Appendix C. Temporal graphs and Mann-Kendall analysis outputs for PFOS+PFHxS and PFOA concentrations in groundwater are included in Appendix D and Appendix E respectively. Groundwater wells have been grouped into indicative regions of interest as summarised in Table 8-1 below.

Table 8-1: Summary of groundwater well groupings

Region of interest	Groundwater locations	Temporal graph reference (Appendix D)
West	MW103, MW107, MW125, MW128, MW148, MW201, MW209, MW210, MW215, MW405, MW451, MW452	Graph D1 and Graph D2
North	MW156, MW194, MW240, MW241, MW453, MW185, MW189, MW190, MW191, MW193, MW195, MW197	Graph D3 and Graph D4
Central	MW115, MW133, MW144, MW205, MW292, MW303	Graph D5 and Graph D6
Southeast	MW112, MW139, MW141, MW235, MW297, MW422, MW454, MW502	Graph D7 and Graph D8
South of the base	MW176, MW180, MW200, MW211	Graph D9 and Graph D10

Mann-Kendall analysis is a non-parametric test used to identify trends in time series data. The significance of these trends is determined by the confidence factor (i.e., *p value*) of the analysis as follows:

- A confidence factor over 95% indicates there is an *increasing* or *decreasing* trend.
- A confidence factor less than 95% indicates *stable* or *no trend.*

Trend analysis was undertaken for locations which were consistently greater than the LOR. Where sample results were less than the LOR, half the LOR was adopted for the Mann-Kendall analysis.

8.3.2 West monitoring wells

A summary of the monitoring well locations in the western portion of the base is provided below:

- MW103 – located within the Former RAAF Fire Station source area.
- MW107 – located between FFF1 and the Former RAAF Fire Station source areas.
- MW215 – located within the FFF1 source area.
- MW125, MW128, MW148, MW201, MW451, MW452 – located to the southwest and west, down hydraulic gradient, of FFF1 and Former RAAF Fire Station source areas.
- MW405 located at Hangar 31 (destroyed).
- MW209 – located within the residential suburb of The Narrows, south of the base.
- MW210 – located to the west of the base in the residential suburb of Ludmilla and down hydraulic gradient of Hangar 31, FFF1 and the Former RAAF Fire Station source areas.

Monitoring well MW405 (adjacent to Hangar 31) was destroyed during the AIR7000 construction project and has not been sampled since April 2020. Sampling of nearby locations including MW215 in FFF1 and groundwater wells down hydraulic gradient (south and southwest) has facilitated the continuing monitoring of PFAS in the western portion of the base. However, potential changes in close proximity to Hangar 31 are limited due to the lack of wells in this area.

The temporal trend analysis graphs (Graph D1 and Graph D2, Appendix D) show that monitoring wells MW103 (located at the RAAF Fire Station), MW210 (within Ludmilla residential area) and MW405 (formerly located at Hangar 31) experience the following seasonal fluctuations:

- MW103 - an increase in concentrations during dry season but are lower at the end of the wet season. As the water levels rise during the wet season, they intercept the highly permeable laterite at a depth between 2 and 5 m bgl. The large grass area up-gradient of this location would lead to increased infiltration and dilution of PFAS within the shallow laterite as the water levels rise during the wet season.

This increase was not observed in the most recent dry season monitoring event (October 2023) as the water levels during the dry-season sampling event were within the laterite.

- MW210 - increased concentrations during dry season/decrease during the wet season, indicating potential dilution effects from wet season rainfall infiltration. This location is greater than 1 km from the nearest source area and would receive rainfall infiltration from areas not impacted by PFAS resulting in dilution.
- MW405 (up to April 2020) – an increase in concentrations during wet season, indicating there might be vertical migration of contamination driven by increased rainfall and infiltration, along with PFAS impacted surface water runoff from the concrete pad north of the well (around Hanger 31).

In MW210, the concentrations of PFAS were observed to increase slightly at each sampling event between March 2019 and April 2021 with limited seasonal fluctuations observed. However, the seasonal fluctuations were evident prior to and after this. A similar pattern of reduced seasonal fluctuations in this period was also observed at monitoring well MW112, located north of FFF5 (refer Section 8.3.5) and MW200 located south of the base (refer Section 8.3.6). The stability of concentrations in this area of the base coincided with a 'dry' wet season in 2019 (1,170 mm which is approximately 70% of long-term average) with an early rain-burst (140 mm) prior to the end of wet season sampling. This may have resulted in the results for these wells being more indicative of 'wet season' conditions, leading to less seasonal variation in the results for this year.

Groundwater well MW209 (within the suburb of The Narrows) reported PFOS+PFHxS concentrations above LOR in only three monitoring rounds (March 2018 and December 2018 during the DSI, and April 2021). MW209 exceeded the ecological guideline level for PFOS in these monitoring rounds and exceeded the human health guideline level for the PFOS+PFHxS in the March 2018 and December 2018 rounds. All other groundwater results in this region report PFOS+PFHxS concentrations consistently above LOR.

A summary of statistical analysis results is presented in Table 8-2 below, with seasonal trends also included for MW103. There were insufficient seasonal data points for Mann-Kendall seasonal analysis to be undertaken at MW405 on a seasonal basis.

There was no trend reported at well MW405 at Hangar 31, noting that the last monitoring round was in 2019/20.

Monitoring well MW215, within the FFF1 source area reported an increasing trend for PFOA and PFOS+PFHxS over the entire course of the monitoring program. However, the results for both PFOA and PFOS+PFHxS have been reported as stable since early 2020.

A stable trend was reported within the RAAF Fire Station. The wells down hydraulic gradient of the RAAF Fire Station reported either a decreasing or no trend. Groundwater well MW209 in The Narrows reported a decreasing trend and MW210 in Ludmilla, a stable trend.

Table 8-2: Mann-Kendall summary – West

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
Within Hangar 31 source area					
MW405	PFOA	0.04 – 0.36	*n/a*[1]	No trend	62.3%
	PFOS+PFHxS	2.03 – 42.2	*n/a*	No trend	50.0%
Within FFF1 source area					
MW215	PFOA	<0.01 – 0.15	0.08	Increasing	98.4%

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
	PFOS+PFHxS	0.09 – 9.32	4.38	Increasing	98.1%
Between Former RAAF Fire Station and FFF1 / Hangar 31 source areas					
MW107	PFOA	0.15 – 0.29	0.13 – 0.14	Decreasing	98.6%
	PFOS+PFHxS	8.46 – 14.8	8.15 – 8.5	Decreasing	99.2%
Within Former RAAF Fire Station source area					
MW103 – All	PFOA	0.02 – 1.11	0.19 – 0.2	Stable	73.6%
	PFOS+PFHxS	1.96 – 48.6	9.26 – 13.6	Stable	73.6%
MW103 – wet	PFOA	0.02 – 0.79	0.2	Stable	50%
	PFOS+PFHxS	1.96 – 43.8	9.26	Stable	72.6%
MW103 – dry	PFOA	0.25 – 1.11	0.19	Stable	76.7%
	PFOS+PFHxS	12.7 – 48.6	13.6	Stable	94.1%
Down hydraulic gradient of RAAF Fire Station source area					
MW125	PFOA	<0.01 – 0.15	0.06 – 0.08	Increasing	98.4%
	PFOS+PFHxS	0.09 – 9.32	4.38 – 4.59	Stable	91.0%
MW128	PFOA	0.09 – 0.21	0.11	Decreasing	99.1%
	PFOS+PFHxS	3.68 – 21.8	4.71 – 4.8	Decreasing	98.8%
MW148	PFOA	0.082 – 0.21	0.09	Decreasing	99.7%
	PFOS+PFHxS	4.7 – 11.3	5.03 – 5.3	Decreasing	97.1%
MW451	PFOA	<0.01 – 0.04	< 0.01	No trend	56.0%
	PFOS+PFHxS	0.02 – 3.5	<0.01 – 0.13	Stable	61.8%
MW452	PFOA	0.04 – 0.09	0.04 – 0.06	No trend	61.8%
	PFOS+PFHxS	2.75 – 5.66	1.95 – 2.94	Stable	85.3%
Coconut Grove, Ludmilla					
MW210	PFOA	0.02 – 0.06	0.03 – 0.05	No trend	50.0%
	PFOS+PFHxS	1.32 – 4.31	1.99 – 3.29	Stable	70.7%
The Narrows					
MW209	PFOA	<0.01	<0.01	No trend	50.0%
	PFOS+PFHxS	<0.01 – 0.58	<0.01	Decreasing	99.7%

8.3.3 North monitoring wells

A summary of monitoring well locations in the northern portion of the Management Area is provided below:

- MW156 located adjacent to Rapid Creek, north-west of the end of the runway.
- MW191, MW193, MW190 (alternate to MW193), MW194 and MW195 – located on DIA-occupied land, northeast of the base adjacent to Rapid Creek.
- MW185 – located to the north of McMillans Rd adjacent to Rapid Creek.
- MW197 – located on DIA-occupied land adjacent to the FFTA2 source area.
- MW240, MW241 and MW453 – located at the CFTA source area (on-base).

The temporal trend analysis graphs (Graph D3 and Graph D4, Appendix D) indicate that consistent seasonal variability was not observed at these monitoring wells until end of dry season (November) 2021 where seasonal fluctuations were observed at MW156, MW185 and MW190 (all adjacent to Rapid Creek). The seasonal variations observed included:

- MW156 (located at the northeastern end of the runway) – increased concentrations reported at the end of wet season indicating there may be vertical migration of contamination driven by increased rainfall. As this groundwater well is located down hydraulic gradient of FFTA1 source area, this well would be receiving more PFAS flux from this source area in wet season.
- MW185 and MW190 (located northwest and north of the base) – increased concentrations during the dry season/reduced concentrations in wet season, indicating a potential dilution effect from the wet season. These locations are > 1 km from the nearest source area and would receive rainfall infiltration from areas not impacted by PFAS resulting in dilution.

Concentrations of PFAS have been reported to fluctuate by one or two orders of magnitude in monitoring wells along Rapid Creek (MW156, MW185, MW191 and MW195). The variable PFAS concentrations in groundwater adjacent to Rapid Creek may be due to the variable nature of PFAS within surface water given the surface water / groundwater interactions present along Rapid Creek, as well as significant changes in standing water levels between wet and dry seasons (i.e., between 0.48 and 3.1 m fluctuations, with an average of 1.6 m fluctuations).

The variability in the data set at these locations will likely impact the ability of Mann-Kendall assessments, however as the variability was not observed at each season, no additional seasonal variations of Mann-Kendall analysis was completed for this region.

All locations reported PFOS+PFHxS above LOR, except two sampling events for MW185 conducted in January and March 2018. Concentrations of PFOA varied, with at least one sampling event for groundwater wells located adjacent to Rapid Creek reporting concentrations below LOR. All wells adjacent to the source areas (CFTA and FFTA2) reported detections of PFOA in all sampling events.

PFAS concentrations were significantly (between one and four orders of magnitude) higher in groundwater wells within the CFTA source area wells (MW240, MW241 and MW453) than down-gradient of this source area (MW185, MW189, MW191 and MW193).

A summary of statistical analysis results is presented in Table 8-3 below. Note that monitoring well MW189 (located adjacent to Rapid Creek, northwest of CFTA) and MW453 (located at CFTA) were excluded from Mann-Kendall statistical assessment as less than seven results were available. MW189 and MW193 were not sampled in this reporting period and haven't been sampled since April 2020 and May 2021, respectively.

Groundwater wells adjacent to Rapid Creek reported either a stable trend, no trend or decreasing trends. Groundwater wells adjacent to the source areas (CFTA and FFTA2) were stable. Remediation is planned at both CFTA and FFTA2 source areas which may affect future groundwater results for these monitoring wells.

Table 8-3: Mann-Kendall summary – North

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
Adjacent to Rapid Creek					
MW156	PFOA	<0.01 – 0.21	0.04 – 0.13	Stable	86.1%
	PFOS+PFHxS	0.47 – 12.3	5.29 – 8.91	Stable	85.8%
MW185	PFOA	<0.01 – 0.02	<0.01 – 0.01	No trend	75.0%

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
	PFOS+PFHxS	<0.01 – 0.6	0.1 – 0.37	No trend	87.9%
MW189	PFOA	<0.01	-[1]	*n/a*[2]	*n/a*[2]
	PFOS+PFHxS	0.05 – 0.08	-[1]	*n/a*[2]	*n/a*[2]
MW190	PFOA	<0.01 – 0.08	<0.01 – 0.04	Stable	94.3%
	PFOS+PFHxS	0.03 – 4.39	0.3 – 1.85	Decreasing	96.8%
MW191	PFOA	<0.01 – 0.06	0.01 – 0.04	Stable	91.3%
	PFOS+PFHxS	0.43 – 3.9	1.46 – 2.46	Decreasing	97.1%
MW193	PFOA	<0.01 – 0.08	-[1]	Decreasing	98.2%
	PFOS+PFHxS	0.13 – 5.0	-[1]	Decreasing	97.9%
MW194	PFOA	0.04 – 0.08	0.04 – 0.05	Stable	87.9%
	PFOS+PFHxS	2.6 - 6	0.51 – 2.68	Decreasing	98.1%
MW195	PFOA	<0.01 – 0.03	<0.01	Stable	86.0%
	PFOS+PFHxS	0.09 – 4.02	0.6 – 0.11	Stable	83.9%
Adjacent to FFTA2 source area					
MW197	PFOA	<0.01 – 0.03	<0.01	Stable	66.0%
	PFOS+PFHxS	0.2 – 4.02	0.6 – 0.11	Stable	94.3%
Adjacent to CFTA source area					
MW240	PFOA	2.8 – 24.0	2.6	Stable	93.7
	PFOS+PFHxS	22.3 – 150.0	19.6	Stable	90.6%
MW241	PFOA	1.55 – 3.6	2.23	Stable	83.1%
	PFOS+PFHxS	9.2 – 28.5	19.6	Stable	58.1%
MW453	PFOA	0.03 – 3.42	2.3 – 2.5	*n/a*[2]	*n/a*[2]
	PFOS+PFHxS	0.32 – 8.18	2.3 – 2.5	*n/a*[2]	*n/a*[2]

Notes:

1. - indicates that there are no concentrations of the respective analyte for this period.
2. *n/a* indicates that there was insufficient data to conduct Mann-Kendall analysis.

8.3.4 Central monitoring wells

A summary of monitoring well locations in the central portion is provided below:

- MW115 – located at the Former ARFF Fire Station source area.
- MW205 – located north of FFF6 (down to cross hydraulic gradient) and FFF4 (cross hydraulic gradient), between the Runway and taxiway.
- MW303, MW133, MW292 (replacement well for MW133) – located within FFF4 and FFF6 source areas.
- MW144 – located at the southern base boundary and down hydraulic gradient from the Former ARFF Fire Station, FFF4, FFF6 and the former Wrapped Stockpile Area.

All central monitoring locations reported PFAS, specifically PFOA and PFOS+PFHxS, concentrations above laboratory LOR during this reporting period.

The temporal trend analysis graphs (Graph D5 and Graph D6, Appendix D) show that seasonal variability was evident in these central wells with PFAS concentration peaks reported at end of dry season and lower concentrations in wet season, indicating a dilution effect from wet season increased infiltration. Groundwater well MW205 has not been sampled since June 2022. Groundwater levels fluctuated significantly in these wells between wet and dry season, with the following changes in SWL recorded between the wet and dry seasons:

- 3.2 to 7.2 m in the former ARFF source area
- 6.0 to 10.2 m in and north of FFF4 and FFF6 source areas
- 0.6 to 3.2 m in the southern boundary area

A summary of statistical analysis results, including seasonal specific analysis, is provided in Table 8-4 below. Monitoring well MW292 (located within FFF4 and FFF6) was excluded from Mann-Kendall statistical assessment as there were insufficient historical results (MW292 has not been sampled since November 2020). PFAS results reported a decreasing trend at the former ARFF Fire Station (PFOA and PFOS+PFHxS), although PFOS+PFHxS concentrations were reported to stable in the dry season only.

The southern base boundary was reported to have stable trends. Wells within and north of FFF4 and FFF6 reported stable trends. A decreasing trend was reported in one well (MW303) for PFOA during dry season only. Remediation is planned at FFF4 and FFF6 in late 2024 which may affect future groundwater results for these monitoring wells.

Table 8-4: Mann-Kendall summary – Central

Monitoring well	Analyte	Season	Historical range	Current reporting period	Mann-Kendall trend	
			min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
At the Former ARFF Fire Station source area						
MW115	PFOA	All	0.79 – 4.1	1.2 – 2.36	Decreasing	99%
		Wet	1.3 – 3.05	1.2	Stable	82.6%
		Dry	1.1 – 4.1	2.36	Stable	89.5%
	PFOS+ PFHxS	All	44.0 – 386.0	66.9 – 228.0	Decreasing	96.6%
		Wet	63.6 – 158.0	66.9	Decreasing	96.2%
		Dry	88.6 – 386.0	228.0	Decreasing	96.8%
North of FFF4 and FFF6						
MW205	PFOA	All	<0.01 – 0.14	0.02 – 0.1	No trend	69.0%
		Wet	<0.01 – 0.1	0.02	Stable	93.1%
		Dry	0.01 – 0.14	0.1	Stable	73.4%
	PFOS+ PFHxS	All	0.7 – 9.0	1.39 – 5.39	Stable	72.1%
		Wet	0.7 – 6.1	1.36	Stable	91.3%
		Dry	1.12 – 9.0	5.93	Stable	50.0%
Within FFF4 and FFF6 source area						
MW303	PFOA	All	0.75 – 3.7	1.23 – 2.78	Stable	86.4%
		Wet	0.84 – 1.44	1.23	Stable	50%
		Dry	1.8 – 3.7	2.78	Decreasing	98.2%
		All	32.0 – 131.0	38.2 – 93.7	Stable	70.5%

Monitoring well	Analyte	Season	Historical range	Current reporting period	Mann-Kendall trend	
			min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
	PFOS+ PFHxS	Wet	32.0 – 64.7	38.2	Stable	50%
		Dry	81.3 – 131.0	93.7	Stable	87%
MW133	PFOA	All	0.27 – 1.4	0.5 – 0.66	Stable	88.3%
		Wet	0.05 – 1.2	0.66	Stable	59.8%
		Dry	<0.01 – 1.4	0.5	Stable	91.3%
	PFOS+ PFHxS	All	14.8 – 133.0	37.0 – 43.5	Stable	86.0%
		Wet	14.8 – 54.8	43.5	Stable	64.5%
		Dry	0.01 - 35.7	37.0	Stable	88.5%
MW292	PFOA	All	0.87 – 1.3	-[1]	*n/a*[2]	*n/a*[2]
	PFOS+ PFHxS		58.0 – 97.0	-[1]	*n/a*[2]	*n/a*[2]
Southern base boundary						
MW144	PFOA	All	0.03 – 0.12	0.04 – 0.06	Stable	89.9%
		Wet	0.03 – 0.07	0.04	Stable	66.2%
		Dry	0.06 – 0.12	0.06	Stable	83.7%
	PFOS+ PFHxS	All	2.15 – 7.9	1.94 – 4.6	Stable	94.1%
		Wet	2.15 – 4.9	1.94	Stable	80.7%
		Dry	4.8 – 7.9	4.6	Stable	76.7%

Notes:
1. - indicates that there are no concentrations of the respective analyte for this period.
2. *n/a* indicates that there was insufficient data to conduct Mann-Kendall analysis.

8.3.5 Southeast monitoring wells

A summary of the monitoring well locations in the southeast area is provided below:

- MW112 – located north of FFF5 (down hydraulic gradient).
- MW422, MW502 (replacement for MW422) – located at FFTA1.
- MW454 – down-gradient plume from FFTA1.
- MW139 – located south of FFTA1 at the base boundary.
- MW141 – located at the southern base boundary, down hydraulic gradient of FFTA1 and FFF5.
- MW297 – located at FFF5.

As noted in the previous interpretive report (AECOM, 2023a), concentration trends at MW422 had been increasing up until the last available sampling event in March 2022. Monitoring well MW422 was unable to be sampled during this reporting period as this well was decommissioned in May 2022 prior to the commencement of remediation works at FFTA1. A replacement well, MW502, was installed within FFTA1 source area (within 2 m of the former location of MW422) upon completion of the remediation works. This well was subsequently sampled in the March 2024 (wet season) GME (AECOM, 2024b). The concentration of PFOA dropped by two orders of magnitude between the last MW422 GME (March 2022) and the first MW502 GME (March 2024) from 12.5 µg/L to 0.16 µg/L. A reduction of one order of magnitude was reported for PFOS+PFHxS, from 93.3 µg/L to 4.28 µg/L. This reduction indicates a reduction in leaching of PFAS from this

source area following remediation. Groundwater well MW502 will continue to be monitored as part of the post-remediation validation sampling, in addition to the ongoing monitoring scope.

MW112 was also not sampled in this reporting period as it is understood to have been destroyed or covered during earthworks (refer Section 3.3).

Temporal trend analysis graphs (Graph D7 and Graph D8, Appendix D) show that monitoring wells MW297 (located at FFF5), MW112 (located north of FFF5) and MW139 (located south of FFTA1) exhibited clear seasonal fluctuations with higher concentrations reported in dry season and lower concentrations in wet season. This indicates potential dilution effects from wet season increased infiltration.

Monitoring wells MW297 and MW139 both reported a one- to two-order of magnitude difference in concentrations between wet and dry seasons. Such a pronounced variation was not observed in MW112. The significantly lower PFAS concentrations reported in the wet season in these wells may be a result of groundwater levels rising into the laterite soils, resulting in rapid rainfall infiltration and dilution of PFAS in groundwater at these locations.

As was observed in MW200, MW210 and MW211 (refer Section 8.3.2 and 8.3.6), groundwater concentrations in MW112 were relatively stable between March 2019 and April 2021, with seasonal fluctuations returning from the November 2021 sampling event.

A summary of statistical analysis results, including seasonal specific analysis for MW112 and MW139, is presented in Table 8-5 below.

Monitoring well MW297 in FFF5 reported a predominantly stable or no trend, except for PFOS+PFHxS which reported a decreasing trend in the wet season. MW112 north of FFF5 also reported decreasing trends (in both PFOA and PFOS+PFHxS) in the dry season when concentrations were lower than in wet season. The dry seasons for both wells continue to report a relatively stable or no trend. Remediation of FFTA1 was completed at during this reporting period and is expected to impact the groundwater concentrations in this well in future events. Groundwater wells south of FFTA1 and well MW454 (north of FFTA1 but also down hydraulic gradient) reported decreasing PFAS trends. It is noted that, due to the gradients in that area, groundwater from FFTA1 flows both to the north and south of FFTA1, with flux to the north (i.e., towards MW454) much larger than to the south.

Table 8-5: Southeast Mann-Kendall summary

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
FFF5 source area					
MW297 – all data	PFOA	0.02 – 1.31	0.02 – 0.66	No trend	77.5%
	PFOS+PFHxS	1.44 – 76.3	1.42 – 39.0	No trend	77.0%
MW297 – wet	PFOA	0.02 – 0.15	0.02	Stable	93.4%
	PFOS+PFHxS	1.44 – 9.78	1.42	Decreasing	97.0%
MW297 – dry	PFOA	0.49 – 1.31	0.66	Stable	50.0%
	PFOS+PFHxS	28.0 – 76.3	39.0	Stable	77.4%
North of FFF5 source area					
MW112 – all data	PFOA	0.15 – 0.34	-[1]	Stable	91.4%
	PFOS+PFHxS	8.23 – 28.5	-[1]	Stable	95.0%
MW112 – wet	PFOA	0.15 – 0.34	-[1]	Decreasing	95.8%
	PFOS+PFHxS	8.23 – 18.4	-[1]	Decreasing	96.4%

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
MW112 – dry	PFOA	0.27 – 0.33	-[1]	Stable	71.3%
	PFOS+PFHxS	17.9 – 28.5	-[1]	Stable	81.6%
South of FFTA1					
MW139 – all data	PFOA	<0.01 – 0.07	<0.01	Decreasing	99.5%
	PFOS+PFHxS	0.41 – 6.4	0.34 – 1.56	Decreasing	99.6%
MW139 – wet	PFOA	<0.01 – 0.02	<0.01	Stable	83.9%
	PFOS+PFHxS	0.41 – 5.06	0.34	Decreasing	98.9%
MW139 – dry	PFOA	0.02 – 0.07	0.02	Decreasing	97.0%
	PFOS+PFHxS	1.94 – 6.4	1.56	Decreasing	99.9%
North of FFTA1					
MW454	PFOA	0.57 – 0.9	0.5 – 0.66	Stable	85.3%
	PFOS+PFHxS	36.2 – 84.0	27.4 – 38.3	Decreasing	96.4%
Southern base boundary, down hydraulic gradient of FFTA1 and FFF5					
MW141	PFOA	<0.01	<0.01	Stable	50.0%
	PFOS+PFHxS	0.21 – 0.45	0.30 – 0.32	Stable	91.7%

Notes:
1. - indicates that there are no concentrations of the respective analyte for this period.

8.3.6 South of the base monitoring wells

A summary of monitoring well locations south of the base is provided below:

- MW176, MW180, MW200 and MW211 – located in Winnellie, south of the base, down hydraulic gradient of the source areas south of the main runway (i.e., FFTA1, FFF5, FFF4, FFF6, former ARFF Fire Station and the former Wrapped Stockpile Area).

The temporal trend analysis graphs (Graph D9 and Graph D10, Appendix D) indicate that monitoring wells MW211 and MW200 (both located in Winnellie) reported increased concentrations during dry season and decrease during wet season, indicating potential dilution effects from wet season rainfall infiltration.

In MW200, the concentrations of PFAS were observed to remain relatively stable between March 2019 and April 2021, however the seasonal fluctuations were evident prior to and after this. A similar trend was observed at MW211, with seasonal fluctuations returning from the November 2020 sampling event. The stability of concentrations in this area of the base coincided with a ‘dry’ wet season in 2019 (1,170 mm which is approximately 70% of long-term average) with an early rain-burst (140 mm) prior to the end of wet season sampling. This may have resulted in the results for these wells being more indicative of ‘wet season’ conditions, leading to less seasonal variation in the results for this year.

The variability in the data set at these locations will likely impact the ability of Mann-Kendall assessments, however as the variability was not observed in sufficient seasons to provide more than seven data points, and no additional seasonal variations of Mann-Kendall analysis was completed for this region.

All groundwater results in this region consistently report PFOS+PFHxS concentrations above LOR. PFOA was regularly detected in MW200 and detected once in MW176 (September 2022). Groundwater wells MW211 and MW180 have not historically reported any detections of PFOA.

Remediation works were recently completed at FFTA1 and the former Wrapped Stockpile Area during this reporting period (at the end of 2023). Further remediation works are scheduled in late 2024 for FFF4 and FFF6. The impact of the completed and planned remediation may impact the future groundwater results for wells in this area.

As only one monitoring round has been completed following the remediation of FFTA1 and the former Wrapped Stockpile Area, coinciding with historically reported decreases in PFAS at the end of wet season, it is unclear if this has had a material impact on these wells to date.

A summary of statistical analysis results is presented in Table 8-6 below. PFOA was reported at a stable or no trend for all wells. MW200 in Winnellie reported PFOS+PFHxS with a decreasing. The other two wells (MW176 and MW180) reported a stable or no trend.

Table 8-6: South of the base Mann-Kendall summary

Monitoring well	Analyte	Historical range	Current reporting period	Mann-Kendall trend	
		min – max (µg/L)	min – max (µg/L)	Trend	Confidence factor
Winnellie					
MW176	PFOA	<0.01 – 0.01	<0.01	Stable	50.0%
	PFOS+PFHxS	0.1 – 0.15	0.1 – 0.13	Stable	92.5%
MW180	PFOA	<0.01	<0.01	Stable	50.0%
	PFOS+PFHxS	0.05 – 0.27	0.07 – 0.09	No trend	72.3%
MW200	PFOA	<0.01 – 0.06	<0.01 – 0.03	Stable	78.6%
	PFOS+PFHxS	0.61 – 4.1	0.5 – 1.52	Decreasing	99.9%
MW211	PFOA	<0.01	<0.01	Stable	50.0%
	PFOS+PFHxS	0.03 – 0.58	0.08 – 0.32	Stable	93.7%

8.3.7 Summary

The nature and extent of groundwater PFAS are consistent with the understanding presented in the previous OMP interpretive report (AECOM, 2023b), apart from the following changes identified during this reporting period:

- PFAS concentrations at MW502 (a replacement for MW422) recorded PFOA and PFOS+PFHxS concentrations two orders of magnitude below historical concentrations. MW502 was installed in FFTA1 less than two metres from the former MW422 following the completion of remediation in this source area. These reduced concentrations are anticipated to remain, as are reduced concentrations down hydraulic gradient (i.e., to the north and south) of FFTA1. The concentrations here will continue to be monitored for changes as part of the OMP, and also as part of the post-remediation monitoring for this area.
- PFAS concentrations within the former RAAF Fire Station (MW103) historically reported an increasing trend in the previous interpretive report, the statistical analysis undertaken following the last wet season sampling event (March 2024) indicates there is no trend at this location.
- Groundwater concentrations within FFF1 (MW215) indicate an increasing trend when the entire dataset is modelled. However, where the results from the OMP program (2019 onwards) are modelled, the trend in concentrations was reported as stable.
- Groundwater concentrations south of the PFAS reported stable concentrations in MW200 and MW211, but following the sampling in the current reporting period, concentrations trends for PFOS+PFHxS showed decreasing trends in MW200.

8.4 SURFACE WATER RESULTS

PFAS analytical results, tabulated against adopted guidelines, are provided in Table C4, Appendix C. A summary of PFOA and PFOS concentration in surface water is presented in Figure 7A and Figure 7B, Appendix A. PFOS, PFOA and/or PFHxS concentrations were detected in surface water monitoring locations across the Management Area.

The highest PFAS concentrations, exceeding the human health criteria in at least one sampling event in this reporting period, were from locations:

- Drainage leading from FFTA1 (March 2024) with a PFOS+PFHxS concentration of 3.67 µg/L reported in March 2024. This is one- to two-orders of magnitude above the concentrations reported in the preceding months (0.029 – 0.04 µg/L in January 2024 to 0.1 µg/L in December 2024), but in the same order of magnitude as previous wet season sampling results. This location will continue to be monitored as part of the OMP and FFTA1 post remediation ongoing monitoring (Coffey, 2022).
- Adjacent to Rapid Creek from SW104 (upstream of the Wier on Rapid Creek) and SW114 (DIA drain near the Dogs Home facility), with PFOS+PFHxS concentrations of 2.78 and 3.74 µg/L respectively reported in the March 2024 sampling event. SW104 is located only 120 metres northwest of SW114. These results were one- to two-orders of magnitude above those reported at the start of wet season (December 2023) with 0.44 µg/L reported at SW104 and below LOR from SW114. These concentrations, including the fluctuation between start and end wet season results, are consistent with historical results.
- Ludmilla Greek (SW125), located west of the base with PFOS+PFHxS concentration of 3.74 µg/L in the end of wet season (March 2024) sampling event. This is consistent with previous sampling events. The start of wet season sampling event (December 2023) reported the lowest PFAS concentrations to date, with PFOS+PFHxS reported at 1.24 µg/L, below the health-based criteria of 2 µg/L for the first time in the OMP program.

All other results were below the health-based criteria for the reporting period. The overall surface water concentrations remained consistent with previous assessments.

8.5 SURFACE WATER TRENDS

Surface water analytical results are presented in Table C4, Appendix C. Temporal graphs for PFOS+PFHxS and PFOA concentrations in surface water are included in Appendix D. The surface water locations have been grouped into the following areas as set out in Table 8-7 below.

Table 8-7: Summary of surface water location areas

Area	Surface water monitoring locations	Temporal graph reference (Appendix D)
Rapid Creek (freshwater)	SW101 (and alternate SW152), SW104, SW106, SW108, SW109	Graph D11 and Graph D12
Rapid Creek (estuarine water)	SW112, SW113	Graph D13 and Graph D14
Rapid Creek catchment (surface drains)	SW114, SW115, SW168, SW300	Graph D15 and Graph D16
Rapid Creek catchment (source areas)	SW156, SW170, SW178, SW181, SW132	Graph D17 and Graph D18
Ludmilla Creek catchment	SW120, SW124, SW125, SW160	Graph D19 and Graph D20

Area	Surface water monitoring locations	Temporal graph reference (Appendix D)
Reichardt and Sadgroves Creek catchments	SW132, SW133, SW143, SW162	Graph D21 and Graph D22

8.5.1 Rapid Creek freshwater

Five surface water monitoring locations in the OMP are positioned between the upper reach of Rapid Creek, adjacent to the end of the eastern runway and McMillans Road. These locations are:

- SW101 (and alternate SW152) – end of the eastern runway.
- SW104 – north of the eastern end of Larkin Avenue.
- SW106 – at the bottom of the constructed rapid/weir northeast of Sir Norman Brearley Drive.
- SW108 – west of where Henry Wrigley Drive crosses over Rapid Creek.
- SW109 – south of McMillans Road and east of Charles Eaton Drive.

Surface water concentrations for this area presented graphically in Graph D11 and Graph D12, Appendix D.

All Rapid Creek freshwater monitoring locations detected PFAS in all sampling events in this reporting period. The majority of results were consistent with historical concentrations. As discussed in Section 8.4, SW104 reported PFOS+PFHxS above the health-based recreational guideline, consistent with the sampling event in March 2023. Exceedance of the guideline has only been recorded in April 2020, March 2023 and March 2024 events, with the concentrations in these months consistent with one-another. Most of the concentrations are lower during the end-of-dry season sampling.

Alternate location SW152 was sampled in lieu of SW101 in this reporting period (as detailed in Section 3.3). SW101 has not been sampled since April 2021 due to inaccessibility.

PFAS concentrations fluctuated across the wet season with higher concentrations at the end of the wet season suggesting PFAS is mobilised from on-base (and other potential DIA) sources by rainfall as the wet season progresses.

Remedial activities completed in 2023 (FFTA1 and the former Wrapped Stockpile Area), and those planned in 2024 / 2025 (CFTA) are anticipated to reduce the long-term mass flux from the base into Rapid Creek.

8.5.2 Rapid Creek estuarine water

Two surface water monitoring locations are located in the lower reach of Rapid Creek within estuarine waters, including:

- SW112 – located within the Rapid Creek mangrove forest, east of Rapid Creek Road.
- SW113 – located east of the Rapid Creek foot bridge, north of Casuarina Drive.

Surface water concentrations for these locations are presented graphically in Graph D13 and Graph D14, Appendix D.

Both Rapid Creek estuarine water monitoring locations reported PFAS above LOR in all sampling events in the reporting period. Both locations exceeded the ecological guideline level for PFOS in all sampling events in the reporting period but did not exceed the relevant guidelines for PFOA and PFOS+PFHxS. These wells are sampled biannually (start and end of wet season). Results were consistent with historical concentrations with higher concentrations (by an approximate order of magnitude) reported in the end of wet season compared to start of wet season. The concentrations in the estuarine water continue to be lower than those in Rapid Creek

fresh waters, as noted in the previous interpretive report, (AECOM, 2023b). This reduced concentration is likely due to mixing of freshwater and saltwater within the estuarine zone.

8.5.3 Rapid Creek catchment surface drains

Three surface water locations monitor stormwater runoff from the base and DIA via surface drainage features to Rapid Creek, namely:

- SW114 – within a north flowing drain on the north side of the eastern portion of Larkin Avenue.
- SW115 – within a north flowing drain on the north side of the western portion of Larkin Avenue.
- SW168 – within a drain that flows under Charles Eaton Drive, between Murphy Drive and Charles Eaton Drive.
- SW300 – at a drain from the bushland area to the north of FFTA2 and the CFTA.

Surface water concentrations for these locations are presented graphically in Graph D15 and Graph D16, Appendix D.

Except for SW115 (north flowing drain on western portion of Larkin Avenue), all other sampling locations reported PFAS concentrations above LOR. These locations with concentrations above LOR all exceeded the ecological guideline level for PFOS. Location SW114 also exceeded the human health recreational guideline level for PFOS+PFHxS. These results are consistent with historical concentrations.

SW115 has reported concentrations below laboratory LOR since the start of wet season 2022 (November 2022). Prior to November 2022, PFOS+PFHxS concentrations at this location ranged from <0.01 µg/L (in December 2020 only) and 1.59 µg/L (January 2020). PFOA concentrations have consistently been below LOR except for two detects in December 2023 (at LOR, 0.01 µg/L) and March 2022 (0.03 µg/L). These minor detections could be due to laboratory variability given they are only marginally above the LOR. The cause of the reduction in PFAS at SW115 is currently unknown. However, the new control tower works were completed (along with pavement upgrades) in the areas up-stream from SW115 at about the time that the PFAS concentrations reduced.

PFAS concentrations were higher at the end of wet season than the start of wet season. Other than SW115, PFAS concentrations at these locations were also higher than the receiving Rapid Creek freshwater locations, likely due to dilution effects in Rapid Creek waters.

8.5.4 Rapid Creek catchment on-base source areas

Five surface water locations monitor stormwater runoff directly from key source areas, namely:

- SW156 – adjacent to CFTA
- SW170 – north of FFTA1, in main southern drain discharging to Rapid Creek
- SW312 – from FFTA1
- SW178 – at FFF5
- SW181 – north of FFF4

Surface water concentrations for this area are presented graphically in Graph D17 and Graph D18, Appendix D.

With the exception of SW178 (at FFF5) in the start of wet season sampling event (December 2023), all other locations reported PFAS concentrations above LOR in both sampling events in this reporting period. These locations with concentrations above LOR all exceeded the ecological guideline level for PFOS. SW312 also

exceeded the human health recreational guideline level for PFOS+PFHxS at the end of wet season sampling event (March 2024).

Surface water sample SW312 (at the drain leading from FFTA1) reported PFOS+PFHxS at a concentration an order of magnitude above recent results in the end of wet season sampling event (March 2024).

PFOA was also reported above LOR (0.03 µg/L) in the same sampling event. This is discussed in more detail in Section 8.4 above. Remediation of FFTA1 was completed in late 2023. Ongoing monitoring of SW312 as part of the OMP program and the post-remediation efficacy sampling (Coffey, 2022) will provide further information to assess the effects of remediation on surface water quality in this area.

All other results were consistent with historical concentrations. Most of the PFAS concentrations at these locations fluctuated with no consistent seasonality, indicating PFAS concentrations in surface water adjacent to on-base source areas continue to be variable.

8.5.5 Ludmilla Creek catchment

Four surface water locations are positioned in Ludmilla Creek, namely:

- SW120 – east side where Ludmilla Creek flows under Dick Ward Drive
- SW124 – Ludmilla Boat Ramp, where Ludmilla Creek enters Darwin Harbour at the end of Colivas Road
- SW125 – drain outlet that empties out from beneath the west side of the south end of Nemarluk Drive
- SW160 – On-base, at a stormwater pipe connected to airside operations, upgradient from the Ludmilla Creek catchment

Surface water concentrations for this area are presented graphically in Graph D19 and Graph D20, Appendix D.

With the exception of SW124 (located at Ludmilla Boat Ramp) in the start of wet season sampling event (December 2023), all locations reported PFAS concentrations above LOR in both sampling events in this reporting period. These locations with concentrations above LOR all exceeded the ecological guideline level for PFOS. Location SW125 also exceeded the human health recreational guideline level for PFOS+PFHxS at the end of wet season sampling event (March 2024). Concentrations below the LOR at SW124 at the start of the wet season are consistent with historical results.

The highest concentration was reported at SW125 (drain outlet at the end of Nemarluk Drive), however, as noted in Section 8.4 these results are consistent with historical results and are lower than the historical maximum of 10.2 µg/L (March 2018).

Seasonal variations have been observed for PFOS+PFHxS in SW120 and SW124 with higher concentrations within wet season (refer Graph D20, Appendix D).

8.5.6 Reichardt and Sadgroves Creek catchments

Four surface water locations monitor the Reichardt and Sadgroves Creek catchments, namely:

- SW132 and SW133 – surface water discharging to Reichardt Creek
- SW143 – surface water discharging to Sadgroves Creek
- SW162 – stormwater leaving the base's southern boundary

Surface water concentrations for this area are presented graphically in Graph D21 and Graph D22, Appendix D.

All locations reported PFAS concentrations above the LOR in both sampling events during this reporting period and exceeding the ecological guideline level for PFOS. All locations were below the human health

recreational guidelines for PFOS+PFHxS. Concentrations reported were consistent (within the same order of magnitude) as historical results with no apparent seasonal variability.

8.6 AQUATIC BIOTA

A summary of aquatic biota concentrations reported within this reporting period is presented in Table 8-8 below. Tabulated analytical results of all current and historical sampling is presented in Table C5, Appendix C. Monitoring activities are summarised in the factual reports provided in Appendix B.

Concentrations of PFOA in all sampled crustaceans were below the adopted screening criteria (10 mg/kg) for aquatic biota during the reporting period. No screening criteria exists for PFOA for fish. Concentrations of PFOA exceeded the LOR in:

- One fish sample from BIO007 at Rapid Creek mouth (0.00015 mg/kg)
- Three invertebrate samples from BIO016 at Ludmilla Creek estuarine area (0.004 – 0.009 mg/kg)
- Three crustacean samples, one from each of BIO018 from Ludmilla Creek boat ramp, and BIO024 and BIO028, both from Rapid Creek freshwater (0.001 mg/kg)

Concentrations of PFOS and PFOS+PFHxS exceeded the adopted screening criteria for aquatic biota of 0.065 mg/kg for crustaceans at the following monitoring locations:

- BIO024 (Rapid Creek Freshwater)
  - One Redclaw Crayfish (Cherux quadricarinatus) – 0.074 mg/kg (crustaceans 0.065 mg/kg)
- BIO026 (Rapid Creek Freshwater)
  - One Cherabin (Macrobrachium spinipes) – 0.42 mg/kg (crustaceans 0.065 mg/kg)
- BIO028 (Rapid Creek Freshwater)
  - One Redclaw Crayfish (Cherux quadricarinatus) – 0.078 mg/kg (crustaceans 0.065 mg/kg)

In addition, the following locations exceeded the 0.0052 mg/kg for finfish for PFOS+PFHxS:

- BIO007 (Rapid Creek mouth)
  - Six Forktail Catfish 1 (Neoarius sp.1)
  - Two Forktail Catfish 2 (Neoarius sp.2)
  - One Banded Archerfish (Toxotes jaculatrix)
  - One Milkfish (Chanos chanos)
  - One Tarpon (Megalops cyprinoides)
- BIO018 (Ludmilla Creek boat ramp)
  - One Queenfish (Scomberoides commersonnianus)
  - One Forktail Catfish 1 (Neoarius sp.1)

Of the 60 aquatic biota samples analysed during this reporting period, 17 analysed samples had concentrations above the screening criteria, accounting for almost 30% of all analysed samples. This is an increase from the 10% reported in the previous interpretive report (AECOM, 2023a).

Sample locations BIO024 and BIO026, both located within Rapid Creek, reported new exceedances of the screening criteria for Redclaw Crayfish (Cherux quadricarinatus) in October 2023. At BIO026 the exceedance (0.42 mg/kg of PFOS+PFHxS in Cherabin (Macrobrachium spinipes)) was an order of magnitude above previous results from the same location. However, it is noted this is the first time this crustacean species has been sampled.

The sample from BIO024 which reported a new exceedance was a Redclaw Crayfish (Cherux quadricarinatus), which was within the same order of magnitude as pervious results but exceeded the crustacean guideline for the first time at that location.

The risks associated with consuming aquatic biota remain similar to conditions described in the HHRA (Coffey, 2018c). Sampling of aquatic biota is primarily to inform NT Department of Health to keep health advisories up to date.

The bioaccumulation of PFAS in aquatic biota will continue to be monitored through the OMP sampling.

Table 8-8: Biota monitoring PFAS summary results (mg/kg)

Target Species	Analyte	Historical range (mg/kg)	OMP monitoring (October 2023) (mg/kg)
BIO024 / BIO026 / BIO028			
Crustaceans	PFOS+PFHxS	<0.001 – 0.139	0.015 – 0.37
	PFOS	<0.0003 – 0.115	0.02 – 0.42
	PFOA	<0.0001 – 0.002	<0.0001 – 0.01
BIO016			
Molluscs	PFOS+PFHxS	<0.001 – 0.118	0.008 – 0.018
	PFOS	<0.0003 – 0.065	0.008 – 0.018
	PFOA	<0.0001 – 0.018	<0.0001 – 0.009
BIO007			
Diadromous or estuarine fish[1]	PFOS+PFHxS	<0.001 – 0.5	<0.001 – 0.084
	PFOS	<0.0003 – 0.036	<0.0003 – 0.084
	PFOA	<0.0001	<0.0001 – 0.00015
BIO018			
Diadromous or estuarine fish[1]	PFOS+PFHxS	<0.001 – 0.048	<0.001 – 0.011
	PFOS	<0.0003 – 0.047	<0.0003 – 0.011
	PFOA	<0.0001 – 0.001	<0.0001 – 0.001

Notes:

1. All samples (primary and duplicates)
2. As ecological criteria is below laboratory LOR, only samples above the LOR have been included.

9. CONCEPTUAL SITE MODEL

The CSM was developed during the DSI (Coffey, 2018a), summarised in the PMAP (Defence, 2019a) and has been recently updated in in the following subsequent reports:

- Tetra Tech Coffey, RAAF Base Darwin – PFAS Investigation, Balance of Base PFAS Remediation Action Plan, December 2023 (Tetra Tech Coffey, 2023)
- RAAF Base Darwin – PFAS Remediation, FFTA1 and Wrapped Stockpile Validation Report, July 2024 (Tetra Tech Coffey, 2024a)
- Tetra Tech Coffey, RAAF Darwin PFAS Management Project, Site Review Assessment Report, March 2024 (Tetra Tech Coffey, 2024b).

9.1 CONCEPTUAL SITE MODEL REVIEW

The groundwater, surface water and biota results from this reporting period have been used to review the CSM, with the following key findings included in the review:

- Most of the PFAS concentrations in groundwater, surface water and biota were within or below historical ranges.
- PFAS concentrations in groundwater at FFTA1 were one to two orders of magnitude lower in this monitoring period. Further sampling is required to assess changes in down gradient groundwater and downstream surface water PFAS concentrations.
- Mann-Kendall statistical trend analysis of groundwater data showed the following:
    - More trends were reported to be decreasing than in the previous interpretive report (AECOM, 2023b) indicating an overall reduction in PFAS movement from the base. Further PFAS movement monitoring and assessment is being undertaken at the base and will confirm this.
    - Increasing trends were reported in MW215 and MW125 within and down-hydraulic gradient of FFF1. Additional investigations are currently being undertaken at this source area to assess what further works (if any) are required to reduce PFAS movement related to this area.
- Concentrations of PFAS in groundwater remain highest at PFAS source areas, with the following source areas reporting the highest PFAS concentrations within the Management Area:
    - Former ARFF Fire Station (MW115)
    - FFF4 and FFF6 (MW133 and MW303)
    - CFTA (MW240 and MW241)

    All source areas listed above have PMAP management actions assigned, including some with active remediation actions, to be undertaken throughout 2024 and 2025.
- PFAS concentrations in groundwater were lower outside of PFAS source areas, consistent with previous results.

Whilst there has been some reduction in PFAS concentrations reported during this reporting period, and a greater number of decreasing trends overall, the data presented in this report does not change the overall assessment of CSM sources, pathways and/or risks to receptors as described in the updated CSM below.

9.2 UPDATED CONCEPTUAL SITE MODEL

9.2.1 Sources of PFAS

AFFF was used by Defence on-base (and on DIA-occupied land at FFTA2) for fire suppression activities, including testing and training in fire training areas and fire stations, and in fire suppression systems associated with fuel storage systems.

The use of AFFF at the base commenced shortly after World War II with natural protein foams (derived from animal products) used. In the late 1960s, synthetic AFFF was developed (such as the PFAS containing 3M Lightwater™) and use of synthetic AFFF products commenced at the base in 1983. The 3M Lightwater™ product was used until the early 2000s and was completely removed from the base in 2009 in preference for Ansulite for fire training activities, hangar and fuel farm fire suppression system operation and testing, incident response and response equipment testing. Ansulite continues to be the main AFFF product available on base for emergency responses (i.e., fuel and aircraft fire extinguishment).

The 3M Lightwater™ products contained various PFAS compounds including PFOS, PFHxS and lesser amounts of PFOA, as well as other minor PFAS compounds. The Ansulite product contains limited PFOS, PFHxS or PFOA as active ingredients, but does include short-chain PFAS compounds and fluorotelomers, some of which may degrade to PFOS, PFHxS or PFOA.

A summary of the primary source areas, as outlined in the PMAP (Defence, 2019a) is included in Table 9-1 below. The location of these sources is shown in Figure 1, Appendix A.

Table 9-1: PFAS Source Areas

PFAS source area	Comments
Former Fire Training Area 1 (FFTA1)	AFFF training activities PFAS identified, and remediation completed in 2023 Currently in post-remediation monitoring phase
Former Fuel Farm 5 (FFF5)	AFFF fire suppression system testing Discharge due to incident reported Low priority source area due to limited PFAS mass and limited contribution to PFAS moving from the Base
Former Fuel Farm 4 (FFF4)	AFFF fire suppression system testing Discharge due to incident reported PFAS identified – planned for remediation 2024 to 2025
Former Fuel Farm 6 (FFF6)	AFFF fire suppression system testing. No reported spills of AFFF PFAS identified – planned for further assessment and remediation 2024 to 2025
Stockpiled AFFF Contaminated Soils (also referred to as *Wrapped Stockpile Area*)	Stockpiles of soils from remediation works conducted at Hangar 31 in 2008 from AFFF release incident Stockpiles were remediated and retained in FFTA1 area in 2023 Minor concentrations of PFAS remain in soils, no further actions
Former ARFF Fire Station	AFFF training, testing and storage. Former location beneath current ordnance loading area (OLA) PFAS delineation in soils and groundwater planned for 2024 to 2025
Hangar 31	AFFF release incident Surface soil remediation occurred 2008 Remaining mass and mass flux being investigated
Former Fuel Farm 1 (FFF1)	AFFF fire suppression system testing Discharge due to incident reported

PFAS source area	Comments
	Majority of fuel farm soils (including PFAS) removed during base upgrade works between 2020 to 2022
Former RAAF Fire Station	AFFF training, testing and storage PFAS identified in soils, and groundwater and contributes to off base movement of PFAS Further assessment being undertaken in 2024 to 2025
Current Fire Training Area (CFTA)	AFFF training activities PFAS identified in soils and groundwater Planned for remediation 2024 to 2025
Former Fire Training Area 2 (FFTA2)	Located on DIA-occupied land AFFF training activities, including use by RAAF Remediation assessment design planned for 2024

Secondary sources of PFAS at the base include:

- PFAS adhered/adsorbed to soils in the vadose zone (unsaturated soils above the groundwater table), leaching to groundwater or surface water with seasonal fluctuations in groundwater levels.
- PFAS in sediments along Rapid or Ludmilla Creeks, drainage lines and surface soils across the base leaching or moving during the wet season.

9.2.2 Pathways for PFAS migration

Potential pathways for the migration of PFAS include the following:

- Leaching and migration from impacted into groundwater or surface water.
- Lateral migration of PFAS in groundwater with the flow of the aquifer.
- Potential extraction of groundwater for irrigation use.
- Discharge of groundwater into surface waters and associated sediments. This includes discharge of groundwater into unlined and lined stormwater drains.
- Surface water runoff from PFAS sources to site drains, depressions, open pits and surrounding creeks.
- Migration of PFAS in surface water (site drains and surrounding creeks) to down-stream areas.
- Infiltration of PFAS impacted surface water into soil and groundwater.
- Uptake of PFAS from sediment, groundwater, and surface water by biota.

The primary pathways for PFAS migration from source to receptors at the base is via groundwater and surface water. The majority of the mass migration is via groundwater, however there are two separate groundwater migration mechanisms including:

Perched flow – Which is where groundwater levels rise during the wet season into the shallow (approx. 1 to 2 m deep) highly permeable[3] lateritic soils and migrate horizontally as ‘perched groundwater’. Heavy rainfall also infiltrates rapidly into the shallow laterite and increases ‘perched’ groundwater flow. Where surface drainage channels are cut into the laterite, the ‘perched’ groundwater discharges into the drainage channels, prior to flowing into surrounding creeks.

Groundwater flow – This is where groundwater flows year-round within the siltstone aquifer (beneath the laterite). The majority of the siltstone is low permeability some areas (such as within white claystone areas of

[3] Permeability refers to how easily water flows through soils or rock. Water does not flow very fast through low-permeability units (e.g. clays or solid rock) but does flow very fast through high-permeability units such as gravels, laterite or open rock-fractures.

the siltstone aquifer) having permeabilities several orders of magnitude higher. The perched flow can result in very high flow velocities and is the primary pathway for PFAS migration from several source areas. The groundwater flow, whilst slower, does transport PFAS from source areas to surface water bodies (i.e. Rapid Creek) where it emerges year-round (Coffey, 2018a, Coffey, 2022d).

Surface water – Surface water PFAS migration occurs across the Base, although the mass of PFAS moving from source areas within the surface water pathway is not as high as the via the perched and groundwater flow.

Sediment transport along drainage lines was investigated during the DSI and later investigations and was considered to result in practically no PFAS movement at the base. This is because most drains are dry through the dry season, and only flow after heavy rainfall in the wet season. The on-base drains also have sediments removed each year.

9.2.3 Receptors

Receptors of PFAS at and off the base were identified in the HHRA (Coffey, 2018c) and the ERA (Coffey, 2018b) and are summarised in Table 9-2 below.

Table 9-2: PFAS Receptors on- and off-Base

Human Receptors	Ecological receptors
• Site personnel • On-base maintenance workers conducting sub-surface works or working on wastewater infrastructure • On-base construction workers conducting excavation works • On-base residents of RAAF Base Darwin • Off-base commercial and industrial workers in areas surrounding the Base • Off-base maintenance workers conducting sub-surface works in areas surrounding the base and affected catchments • Off-base construction workers conducting excavation works in areas surrounding the base and affected catchments • Off-base residents primarily those surrounding the base and affected catchments • Recreational users, undertaking activities such as swimming and fishing, within Rapid Creek, Ludmilla Creek, Sadgroves Creek and Reichardt Creek Potential users of extracted groundwater down-gradient of source areas	• Terrestrial flora and fauna - including plants, trees, birds, reptiles, mammals, insects and invertebrates. • Aquatic flora and fauna

10. RISK PROFILE REVIEW

The data collected during this OMP reporting period (June 2023 to April 2024), when combined with the historical monitoring conducted at the base to date, suggest that the risk profile to human health and ecological receptors within the PFAS Management Area is overall unchanged since the publication of the HHRA (Coffey, 2018c). This is discussed further in the sections below.

10.1 GROUNDWATER

10.1.1 Nature and extent of groundwater PFAS impacts

PFAS concentrations in groundwater at the FFTA1 source area have reduced by one to two orders of magnitude following the completion of remediation at this source area. It is noted however, that this is based on one sampling event, and further sampling is required to confirm these concentrations.

Consistent with what was reported in the previous interpretive report (AECOM, 2023a), other than FFTA1 (which no longer reported the highest concentrations in the recent sampling events), the highest concentrations reported were at key PFAS source areas:

- FFF4 and FFF6
- Former ARFF Fire Station
- CFTA

Groundwater concentrations of PFAS in wells away from the source areas were typically one to two orders of magnitude lower than those reported in these key PFAS source areas.

10.1.2 Areas of groundwater PFAS concentration change

A summary of changes in Mann-Kendall trend analysis between this OMR and the previous interpretive report (AECOM, 2023a) is presented in Table 10-1 below. Green shading represents a reducing trend (e.g. from *increasing trend* to *decreasing*, *stable,* or *no trend*), and orange shading represents the trend has changed from a *decreasing* trend to a *stable* trend, or to an *increasing* trend when it wasn't previously.

Three groundwater wells (MW215 and MW125) reported trends changing to *increasing*. Further monitoring would be required to confirm the concentration changes in this area. As mentioned in Section 9, additional investigation works are underway in this source area currently.

Table 10-1: Summary of changes in Mann-Kendall trend analysis

Location	Monitoring Well	Analyte	Mann-Kendall trend in previous interpretive report	Mann-Kendall trend in this OMR[2]
West				
Former RAAF Fire Station	MW103	PFOA	Increasing	Stable
		PFOS+PFHxS	Increasing	Stable
Between Former RAAF Fire Station and FFF1 source areas	MW107	PFOA	Stable	Decreasing
		PFOS+PFHxS	Stable	Decreasing
FFF1	MW215	PFOA	Stable	Increasing
		PFOS+PFHxS	Stable	Increasing
Down hydraulic gradient of RAAF Fire Station and FFF1	MW125	PFOA	Stable	Increasing
		PFOS+PFHxS	Decreasing	Stable
	MW148	PFOA	Decreasing	Decreasing
		PFOS+PFHxS	Stable	Decreasing
South of the base				
Winnellie	MW200	PFOA	Stable	Stable
		PFOS+PFHxS	Stable	Decreasing
The Narrows	MW209	PFOA	No trend	No trend
		PFOS+PFHxS	Stable	Decreasing
North				
Adjacent to Rapid Creek	MW156	PFOA	Decreasing	Stable
		PFOS+PFHxS	Decreasing	Stable
	MW190	PFOA	Stable	Stable
		PFOS+PFHxS	Stable	Decreasing
	MW194	PFOA	Stable	Stable
		PFOS+PFHxS	Stable	Decreasing
Adjacent to CFTA	MW240	PFOA	Stable	Stable
		PFOS+PFHxS	Stable	No Trend

Notes:

1. Green shading indicates that the trend has changed from and *increasing* trend to a *decreasing, stable,* or *no* trend. Orange shading indicates that the trend has changed from a *decreasing* to *stable* trend or *stable* trend to an *increasing* trend compared with previous trend-analysis results.

10.2 SURFACE WATER

10.2.1 Nature and extent of groundwater PFAS impacts

Concentrations of PFAS remained within historical ranges reported throughout the Management Area, and most conditions within the Management Area are unchanged from the findings of the HHRA (Coffey, 2018c).

All concentrations were below health-based (recreational) guidelines except for the following locations, all collected from the March 2024 (end of wet season) monitoring event:

- SW312 – Located in a drain leading from FFTA1 towards Rapid Creek
- SW104 – Rapid Creek freshwater, located at the north of the eastern end of Larkin Avenue
- SW114 – Located within a north flowing DIA drain on the north side of the eastern portion of Larkin Avenue
- SW125 – Located in the Ludmilla Creek catchment, in a drain outlet that empties out from beneath the west side of the south end of Nemarluk Drive.

All the above have historically been above the health-based (recreational) guidelines and therefore the risk profile remains unchanged.

10.2.2 Areas of surface water PFAS concentration change

The drainage line leading from FFTA1 reported (in March 2024) a PFOS+PFHxS concentration of 3.67 µg/L. This is one to two-orders of magnitude above the concentrations reported in the preceding monitoring events (0.029 – 0.04 µg/L in January 2024 to 0.1 µg/L in December 2024), but in the same order of magnitude as previous wet season sampling results. This location will continue to be monitored as part of the OMP and FFTA1 post remediation ongoing monitoring (Coffey, 2022).

All other results were consistent with historical results.

10.3 AQUATIC BIOTA

10.3.1 PFAS impacts

60 biota samples were analysed for PFAS in the October 2023 sampling event. Concentrations of PFOA and PFOS+PFHxS in aquatic biota sampled in October 2023 exceeded the adopted screening criteria for finfish (2-6 years) in approximately 30% of samples. This is an increase from 10% from the last interpretive report (AECOM, 2024). Only 5% exceeded the adopted screening criteria for crustaceans (2-6 years).

Sample locations within Rapid Creek freshwaters, reported two new exceedances of the screening criteria crustaceans in the October 2023. At one location, the exceedance was an order of magnitude above previous results from the same location. However, it is noted this is the first-time that the crustacean species Cherabin (Macrobrachium spinipes) has been sampled. The other exceedance reported was also a Redclaw Crayfish (Cherux quadricarinatus), but within the same order of magnitude as previous results.

10.3.2 Risks

The risks associated with consuming aquatic biota are consistent with assumptions and concentrations adopted in the development of the HHRA (Coffey, 2018c). Sampling of aquatic biota is primarily to inform NT Department of Health to update health advisories associated with consumption of biota from Rapid and Ludmilla Creeks as required.

11. CONCLUSIONS

Groundwater, surface water and aquatic biota sampling was undertaken between August 2023 and April 2024. This OMR covers the reporting period from June 2023 as there was a scheduled surface water sampling event in that month, however this was not completed due to insufficient water present to sample.

The results for the reporting period indicate the nature and extent of PFAS in groundwater, surface water and aquatic biota are consistent with previous findings.

Fluctuations were observed and are likely due to seasonal variability of the wet and dry seasons. A decrease in groundwater concentrations at FFTA1 is also attributed to the remediation works completed in late 2023. An increasing trend was observed at FFF1 (i.e., MW215), however as the results remain within one order of magnitude of historical results, this indicates no significant changes occurred. Further investigation is being undertaken in this area in 2024.

The following source areas are the subject of planned remediation or management actions at the base scheduled to commence in 2024 and/or 2025:

- FFF4
- FFF6
- CFTA

The CSM was reviewed, and based on the results presented within this report, no changes are identified to sources (noting the removal of the bulk of the Wrapped Stockpile Area impacts), pathways or risks to receptors at the base and within the Management Area. Whilst remediation at FFTA1 was completed in 2023, post-remediation monitoring at FFTA1 is ongoing to assess the success of remediation.

The monitoring conducted over the reporting period is considered to have met the objectives of the SAQP and OMP. The PMAP and the OMP is currently under review, and a revised OMP and SAQP will be issued in 2024.

1.0 Introduction

1.1 Preamble

In July 2019 AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement routine monitoring programs for per- and poly-fluoroalkyl substances (PFAS) over a three-year period at selected Defence sites within the following four Defence regions:

- New South Wales and Jervis Bay Territories (excluding Riverina) Region (NSW & ACT)
- North Queensland Region (North QLD)
- South Queensland Region (South QLD)
- South Australia and Northern Territory Region (SA & NT).

This Sampling Analysis and Quality Plan (SAQP) has been prepared in relation to the proposed Ongoing Monitoring Plan (OMP) (Coffey, 2019a) works at the RAAF Base Darwin (the Base) (**Figure 1, Appendix B**) in the **SA & NT Region**. RAAF Base Darwin is located approximately seven kilometres from the Darwin central business district in the NT.

1.2 SAQP objectives

The objectives of this SAQP are to:

- define the proposed scope of works in detail.
- outline the proposed sampling methodology and procedures to be adopted.
- outline the proposed quality assurance and quality control (QA/QC) measures to be adopted.
- define the data collection and management requirements for the project.

1.3 Scope of works

To meet the OMP (Coffey, 2019a) objectives, the following scope of works are for a three-year monitoring period (2019 to 2022) as detailed in the Base OMP. The scope of works has been extended an additional two years from 2022 to the end of 2024 and has been updated to address identified data gaps and recommendations from previous sampling rounds. This is reflected in **Table 1** and will be implemented for the remaining duration of the OMP (Coffey, 2019a).

Table 1 Scope of Works- Yearly Monitoring Commitment

Sample matrix	Number of sample locations	Laboratory analysis	Frequency	Number of monitoring events per year	Approximate monitoring period
Groundwater (on- and off-Base bores)	34 monitoring locations	Standard PFAS Laboratory Suite (Department of Defence 2022)	Biannual	2	End-Wet season (March), and end-Dry season (October-December)
Surface water (off-Base)	14 monitoring locations	Standard PFAS Laboratory Suite (Department of Defence 2022)	Twice in Wet Season	2	Start-Wet season (undertaken as soon as practicable after a first flush rain event), nominally December/January,

Sample matrix	Number of sample locations	Laboratory analysis	Frequency	Number of monitoring events per year	Approximate monitoring period
					and end-Wet season (March).
Surface water (off-Base)	1 monitoring location	Standard PFAS Laboratory Suite (Department of Defence 2022)	Monthly throughout Wet season	5	Monthly December – April.
Surface water (off-Base)	1 monitoring location	Standard PFAS Laboratory Suite (Department of Defence 2022)	Monthly throughout Wet season and twice during the dry season	7	Monthly December – April, and June and August.
Surface water (on-Base)	2 monitoring location	Standard PFAS Laboratory Suite (Department of Defence 2022)	Monthly throughout Wet season	5	Monthly December – April.
Surface water (on-Base)	7 monitoring locations	Standard PFAS Laboratory Suite (Department of Defence 2022)	Twice in Wet Season	2	Start-Wet season (undertaken as soon as practicable after a first flush rain event), following a greater than 100mm rain event, nominally December/January), and end-Wet season (March)
Aquatic biota (off-Base)	6 monitoring locations	Standard PFAS Laboratory Suite (Department of Defence 2022)	Annually	1	End-Dry season or start-Wet season (October –December)

All samples collected will be analysed for the standard PFAS Laboratory Suite at a NATA accredited laboratory.

2.0 Site Identification

2.1 Site details

The Base is located on the Stuart Highway approximately seven kilometres from the Darwin central business district, adjacent to the suburbs of Winnellie, Ludmilla, Coconut Grove, Millner, Jingili, Moil, Anula, Malak, Karama, and the North Lakes Estate.

The Base encompasses an area of 1,278 hectares bounded by McMillans Road and the Northlakes Estate/Marrara Sports Complex to the north, Amy Johnson Avenue to the east, Stuart Highway to the south and Bagot Road to the west. Darwin International Airport (DIA) occupies an area within the northwest of the Base.

The Base is an operational joint civil-military airfield. The Base has administrative, accommodation, recreational and operational support facilities as well as technical workshops, aircraft hardstands and aircraft pavements. In addition to civil aircraft operations, the airfield supports both Australian and international military aircraft operations. Aircraft movement areas (runways and taxiways) are utilised by both civilian air operations and Defence.

The Management Area includes selected areas of RAAF Base Darwin, selected portions of the surface water bodies of Rapid Creek, Ludmilla Creek, Reichardt Creek, and Sadgroves Creek and groundwater containing PFAS in the suburb of Ludmilla, Rapid Creek, and Winnellie.

2.2 Conceptual site model

The Conceptual Site Model (CSM) is presented in the Human Health Risk assessment (HHRA) report (Coffey 2018a) and the Supplementary Detailed Site Investigation (DSI) (Coffey, 2018c) which summarises the linkages between sources, exposure pathways and receptors and PFAS extents.

3.0 Data Quality Assessment

3.1 Data quality objectives

The amended National Environmental Protection Measure (NEPM, Schedule B [2]) Guideline on Site Characterisation (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process (EPA QA/G-4: EPA/240/B-06/001), February 2006.*

The US EPA defines the process as *'a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect'.*

The process of establishing appropriate DQOs is defined according to the following seven steps (**Table 2**):

Table 2 The seven steps in defining DQOs

Step	Data quality objective step
1	***State the problem*** – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	***Identify the goal of the study*** – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	***Identify information inputs*** – Identify data and information needed to answer study questions.
4	***Define the boundaries of the study*** – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	***Develop the analytic approach*** – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	***Specify performance or acceptance criteria*** – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	***Develop the plan for obtaining data*** – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed below.

3.1.1 Step 1 – State the problem

PFAS contamination at the Base has led to the contamination of soil, groundwater, and surface water. PFAS has been measured within biota from surrounding surface water bodies. Advice has been provided to NT agencies regarding the consumption of biota in some water bodies surrounding the Base, as well as various advice regarding management of maintenance activities on the Base. Monitoring of the concentrations of PFAS in the environment is required to ensure that health advice provided to the NT agencies is relevant and appropriate and risks to human health and environmental receptors are managed.

3.1.2 Step 2 – Identify the goal of the study

The overall goal of the study is to establish a systematic routine groundwater, surface water and biota sampling and analysis program to provide current and ongoing information on the distribution and concentrations of PFAS in the Management Area.

Specific goals of the program are to:

- understand the changes and trends in the nature, extent, and magnitude of PFAS concentrations in the groundwater, surface water and biota within the Management Area.
- understand if the nature, extent, and magnitude of PFAS concentrations has changed significantly to warrant a revision to the human health and environmental risk assessments.
- understand if the nature, extent, and magnitude of PFAS concentrations have changed significantly to warrant refinement of any existing management measures.

3.1.3 Step 3 – Identify information inputs

To allow assessment of the data against the study goal listed in Step 2 above, the following inputs will be considered:

- PFAS results from previous environmental investigations
- meteorological data including rainfall
- groundwater, surface water and biota sample data collected and analysed for PFAS
- groundwater elevation data
- surface water conditions at time of sampling of surface water and biota
- statistical analysis to identify trends
- advances in laboratory analytical approaches and changes in regulatory requirements.

3.1.4 Step 4 – Define the boundaries of the study

The spatial and temporal boundaries that apply for data collection are detailed below and will influence the decision-making process for ongoing monitoring:

- The spatial boundary for data collection and decision making is limited to the Management Area shown in Figure 1.
- The sampling completed as part of the OMP (Coffey, 2019a) will be limited to groundwater, surface water and biota at the frequencies defined in Section 4.0.
- The monitoring has occurred over an initial period of three years with the inclusion of an additional two-year extension through July 2024, the need for ongoing monitoring thereafter will be considered.

3.1.5 Step 5 – develop the analytical approach

The decision rules can be defined as:

- Analytical selection; all samples will be analysed for the extended PFAS suite (Department of Defence 2022).
- Analytical method selection for PFAS is based on achieving appropriate laboratory Limit of Reporting (LOR) in the various media to be analysed.
- Sample locations have been selected with the objective of monitoring PFAS trends (temporal and seasonal), providing early warning of changes in the migration of PFAS in surface water and groundwater.
- If the laboratory quality assurance/quality control data are within the acceptable ranges, the data will be considered suitable for use.
- If PFAS concentrations are reported above the laboratory LOR, where it was previously <LOR, then it will be considered whether further assessment of the data will be required.

- If the PFAS concentrations in groundwater, surface water and biota sampling locations show an increasing trend over two years of monitoring or increase by >30% in one year, then Defence shall be notified of the results, a review of the OMP (Coffey, 2019a) shall be considered, and the need for further assessment shall be considered.

The decision on the acceptance of the analytical data should be made on the basis of the Data Quality Indicators (DQIs) as follows:

- **Precision:** A quantitative measure of the variability (or reproducibility) of data.
- **Accuracy**: A quantitative measure of the closeness of reported data to the “true” value.
- **Representativeness**: The confidence (expressed qualitatively) that data are representative of each media present on Base..
- **Completeness**: A measure of the amount of useable data from a data collection activity.
- **Comparability**: The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.

3.1.6 Step 6 – specify performance or acceptance criteria

Specific limits for the works included in the OMP (Coffey, 2019a) are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and standard procedures for field sampling and handling.

This step also examines the certainty of conclusive statements based on the available new data collected. This should include the following points to quantify tolerable limits:

- A decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative.
- A decision error in the context of the decision rule presented above would lead to either underestimation or overestimation of the risk level associated with a particular sampling area.
- Sampling errors may occur when the sampling program does not adequately detect the variability of a contaminant from point to point across the Base. To address this, alternate locations may be sampled, or additional sampling events may be conducted. There may be limitations in the data if aspects of the OMP (Coffey, 2019a) cannot be implemented, such as:
  - Surface water or groundwater sample locations may be dry at the time of sampling.
  - Groundwater sampling locations are damaged or destroyed and therefore cannot be sampled.
  - Access to some sampling locations could be being restricted due to operational activities or inaccessible due to weather.
- Measurement errors can occur during sample collection, handling, preparation, analysis, and data reduction. To address this the following measures are proposed:
  - Collection of sufficient sample mass to facilitate analysis reported to standard laboratory detections limits. Collection of insufficient sample mass may result in raised detection limits.
  - Field staff to follow a standard procedure when collecting samples, including decontamination of tools, and use of appropriate sample containers and preservation methods.
  - Laboratories to follow a standard procedure when preparing samples for analysis and undertaking analysis.
  - Laboratories to report quality assurance/quality control data for comparison with the DQIs established for the SAQP.

3.1.7 Step 7 – Optimise the design for obtaining data

The methodology presented in this SAQP is designed to meet the Project objectives and to achieve the nominated DQOs. Optimisation of the data collection process will be achieved by:

- Working closely with the analytical laboratories and sampling equipment suppliers to ensure that appropriate procedures and processes are developed and implemented prior to and during the fieldwork, to ensure that sample handling, and transport to and processing by the analytical laboratories is appropriate.
- Conducting sampling according to Defence and Australian Standards for the type of sampling being conducted (i.e. groundwater monitoring well sampling versus landholder bore water sampling). These standards are as follows:
  - Department of Defence (July 2018, Amended August 2019), *Contamination Management Manual*
  - Standards Australia (AS/NZS5667.11–1998) Water Quality – Sampling, part 11: *Guidance on sampling of groundwater*
  - Standards Australia (AS 4482.1-2005) *Guide to the sampling and investigation of potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds*
  - Standards Australia (AS 4482.2-1999) *Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile Substances*
  - HEPA (2020) PFAS National Environmental Management Plan (NEMP) 2.0.
- Conducting sampling in accordance with AECOM's internal PFAS Sample Collection Guidance.
- Sampling conducted by suitably qualified and experienced field staff.
- Basing the sampling upon a CSM developed using the information available at the implementation of the SAQP. Updating the CSM as new data becomes available in the course of the implementation of the SAQP, as required.
- Progressive review of the data throughout the initial three-year OMP (Coffey, 2019a) period plus additional two-year extension and modification of sampling programs to optimise the value of data generated.

If the objectives of the SAQP are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of data quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

- Documentation and data completeness
- Data quality – comparability, representativeness, precision, and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use.

The acceptance criteria for DQIs for samples are specified in **Table 3**

Table 3 Acceptance Criteria for Data Quality Indicators for Sample Analysis

Data quality indicators	Acceptance criteria
Water and biota samples	
Rinsate blanks (where sampling equipment is reused)	Less than the laboratory LOR.
Field blanks	Less than the laboratory LOR.
Field intra- and inter-laboratory duplicates	The RPDs will be assessed as acceptable if less than or equal to 30% as per the NEPM Schedule B3. Where the results show greater than 30% difference a review of the cause will be conducted (NEPM, 2013). It is noted that RPDs that exceed this range may be considered acceptable where: • results are less than 10 times the LOR (no limit) • results are less than 20 times the LOR and the RPD is less than 50% • heterogeneous materials are encountered.
Laboratory duplicates	RPDs less than: • 20% for high level laboratory duplicates (i.e. >20 x LOR) • 50% for medium level laboratory duplicates (i.e. 10 to 20 x LOR).
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's QC report, based on their historical database.
Laboratory method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between laboratories specified range for each analyte / analytical suite (Department of Defence 2022).

4.0 Sampling Location Rationale and Methodology

The OMP (Coffey, 2019a) is presented as **Appendix F** of the RAAF Base Darwin PMAP (Defence, 2019) and identifies the specific inputs required to meet Defence's long-term strategic goals in relation to the management of PFAS contamination at the Base.

The OMP (Coffey, 2019a) presents an overview of specific monitoring works to be undertaken and provides the basis for the preparation of this SAQP. This scope of works presented in this SAQP is consistent with that detailed in the OMP (Coffey, 2019a), with the exception of those points of deviation presented in Section 4.19.

4.1 Proposed schedule

The key elements of the OMP (Coffey, 2019a) are bi-annual monitoring of groundwater and off-base surface water locations, twice yearly (Wet season only) of on-base surface water locations and annual monitoring of biota within Rapid and Ludmilla Creeks. Selected surface water locations will undergo monthly sampling during the wet season, and one of these will undergo mid dry season sampling in both June and August. Bi-annual events are to occur at the end of wet season and end of dry season when groundwater and surface water conditions reflect seasonal influences. On-Base locations have been nominated for wet-season sampling only to assess concentrations and flow rates in drains that capture run-off from PFAS source areas or where significant discharge of water has been observed. The annual biota sampling is to occur at the end of the Dry season prior to substantial commencement of the Wet season, when concentrations are expected to be highest.

Sample events should be conducted in the following periods:

- Start of wet season, December/January- Monthly surface water sampling during wet season, December/January/February/March/April
- End of wet season, March/April
- Mid dry season sampling, June/August
- End of dry season, October/November

A program schedule is presented in **Appendix A**.

Table 4 Proposed annual schedule

Season	Event	Sampling period	Reporting period
Early mid wet season	Monthly surface water sampling- On-Base/ Off-Base	January-April	June Factual Report
Mid late wet season	Biannual groundwater sampling On-Base/ Off-Base	March	
	End of wet season surface water sampling- On-Base/ Off-Base	March	
	Monthly wet season surface water sampling- On-Base/ Off-Base	January-April	
Early mid dry season	June and August surface water sampling	June and August	January Factual Report

Season	Event	Sampling period	Reporting period
Late dry season	Biannual groundwater sampling- On-Base/ Off-Base	October	
	Annual aquatic biota Off-Base	October-December	

4.2 Access requirements for sampling on RAAF Base Darwin

4.2.1 Access requirements for sampling on-Base

A range of access requirements exist to gain access to the appropriate areas for the collection of groundwater and surface water samples. Initiating contact with RAAF Base Darwin no less than two weeks prior to sampling is necessary to ensure all access requirements are satisfied and approved by Base Management.

To gain access to RAAF Base Darwin each field team member must obtain baseline clearance from Defence and receive a Defence Common Access Card (DCAC), which allows unescorted entry to the base. Field team members without baseline clearance and DCAC's will need to be escorted by a field team member that has escort authority associated with their DCAC or have arranged an escort prior to sampling.

To conduct works on the Base, Estate and Infrastructure Group (E&IG) the contracted Base Manager E&IG, must be contacted to inform them of the intended works and to gain permission prior to carrying those out. As well as grant permission to conduct works, E&IG will alert the dedicated field team of any conflicting works on base. Photo permits must be obtained from E&IG upon arrival at the base, no photos are to be taken before this is done.

If sample locations occur in a construction site, the field team will need to get permission from the project manager to access the site. Any internal inductions for the site will also need to be completed by the team upon the project manager's request.

2nd Security Forces Squadron RAAF (2SECFOR) is the Base security service and will need to be made aware of the works to be carried out and the locations that sampling will occur in.

To gain access to the airside locations a Work Safety Officer (WSO) will need to be contacted and present for the duration of airside activities. Field team members entering airside locations will need to ensure they complete airside awareness training. This can be organised by enquiring with E&IG.

For sampling locations in the ordnance area, Defence contractor Thales, will need to be contacted to arrange entry, and 2SECFOR alerted to the fact that the team has intention to enter the area.

4.3 Groundwater sample location rationale

There are 34 monitoring wells identified for ongoing monitoring, including on-Base and off-Base locations (comprising of public land access). The OMP (Coffey, 2019a) will monitor groundwater source area concentration changes and changes that may occur at the Base boundary or off-Base locations, which could indicate a change in contaminant transport off-Base.

Table 5 Groundwater Sample Rationale

Area	Rationale
On-Base	• monitor spatial and temporal variations in PFAS concentrations in groundwater up, down and cross-gradient of source areas. • assess if groundwater PFAS concentrations within and downgradient of the source areas change in response to management measures over time • provide data to estimate mass of PFAS entering Rapid Creek in the future and monitor changes.

Area	Rationale
Off-Base - North	• monitor the spatial and temporal variation in the northern extents of the plume boundary. • provide data to estimate mass of PFAS entering Rapid Creek in the future and monitor changes.
Off-Base – South	• monitor the spatial and temporal variation in the southern extents of the plume boundary. • provide data to estimate mass of PFAS entering Sadgroves and Reichardt Creeks in the future and monitor changes.
Off-Base – West and Southwest	• monitor the spatial and temporal variation in the western and south-western extents of the plume boundary. • provide data to estimate mass of PFAS entering Ludmilla Creek in the future and monitor changes.

4.4 Groundwater sampling locations

The groundwater sample locations to be monitored are presented in Table 6 below, on **Figure 2** in **Appendix B** and **Table 1**, **Appendix C**.

Table 6 Groundwater Monitoring Locations

Area	Description	Sampling location code	Sampling frequency	Number of wells/bores
On-Base	Former Fuel Farm 1 and Hanger 31	MW215	Bi-annual (End-Wet season, and end-Dry season)	**On-Base** (22 locations)
	Former Fuel Farm 5	MW297, MW112		
	Former Fuel Farms 4 & 6	MW303, MW133, MW205		
	Former Fire Training Area 1	MW422, MW139		
	Current Fire Training Area	MW240, MW241		
	RAAF Fire Station	MW103		
	Former ARFF Fire Station	MW115		
	Source area downgradient transect	MW107, MW128		
	Southern boundary of Base	MW141, MW144		
	Western boundary of Base	MW148		
	Rapid Creek - Eastern end	MW156		
	Western Boundary	MW451 and MW452		
	Current Fire Training Area (CFTA)	MW453		
	Centreline of plume from Former Fire Training Area 1 (FFTA1)	MW454		

Area	Description	Sampling location code	Sampling frequency	Number of wells/bores
Off-Base	Former Fire training area 2 (DIA)	MW197	Bi-annual (End-Wet season, and end-Dry season)	**Off-Base** (12 locations)
	Off-Base-north	MW185		
	Rapid Creek	MW191, MW190, MW194, MW195		
	Off-Base-south	MW176, MW180, MW200, MW209		
	Off-Base southwest	MW211		
	Off-Base-west	MW210		

4.5 Surface water sampling location rationale

There are 23 surface water locations identified for ongoing monitoring, including on-Base and off-Base locations (comprising of public land access). The OMP (Coffey, 2019a) will monitor water quality in the surface water systems down gradient of the Base (Rapid, Sadgroves, Reichardt and Ludmilla Creek), and site run-off drains (**Table 7**). The on-Base locations were nominated to assess concentrations and flow rates in drains that capture run-off from PFAS source areas or where significant discharge of water has been observed.

Table 7 Surface Water Sample Rationale

Area	Rationale
On-Base	• Assess concentrations and flow rates in drains that capture run-off from PFAS source areas, or where significant discharge of water has been observed. • Monitor concentrations of PFAS in stormwater leaving the Base. • Monitor concentrations of PFAS in Rapid Creek. • Monitor medium-term effects of remediation where the FFTA1 plume discharges post wet season.
Off-Base	• Monitor spatial and temporal variations in PFAS concentrations in surface water systems down gradient of the site (Rapid, Sadgroves, Reichardt and Ludmilla Creek. • Monitor concentrations of PFAS in Rapid and Ludmilla Creek.

4.6 Surface water sampling locations

The surface water monitoring locations have been selected to maintain consistency with the monitoring completed during the interim monitoring events and the investigation phases.

Many of the locations have been previously sampled several times, and continued monitoring will provide additional data to assess temporal variability. The locations to be monitored vary between a biannual (twice yearly) and monthly wet season basis and are provided in **Table 8** below, on **Figure 3** in **Appendix B** and **Table 2**, **Appendix C**.

Table 8 Surface water sampling locations

Area	Description	Sampling location code	Sampling frequency	Number of locations
On-Base	Surface water flow – current fire training ground	SW156	Twice yearly (Start-Wet season, end-Wet season)	**On-Base (8 locations)**

Area	Description	Sampling location code	Sampling frequency	Number of locations
	Stormwater pipe - Airside operations	SW160		
	Stormwater– southern boundary	SW162		
	Surface water drain - near Former Fuel Farm 5	SW178		
	Surface water drain - north of Former Fuel Farms 4 & 6	SW181		
	Rapid Creek	SW152		
	Surface water drain - Eastern end of runway	SW170	Monthly sampling through Wet season (Dec – Apr)	
	Drainage from FFTA1	SW312		
Off-Base	Rapid Creek	SW104, SW106, SW108, SW112, SW113	Twice yearly (Start-Wet season, end-Wet season)	**Off-Base (16 locations)**
	DIA drain to Rapid Creek	SW114, SW115, SW168		
	Ludmilla Creek	SW120, SW124, SW125		
	Reichardt Creek	SW132, SW133		
	Drain to Sadgroves Creek	SW143		
	Osgood Drive	SW300	Monthly sampling through Wet season (Dec – Apr)	
	Rapid Creek	SW109	Monthly sampling through Wet season (Dec – Apr) and once in both June and August	

4.7 Biota sampling locations

In addition to collection of groundwater and surface water samples, aquatic biota (fish and aquatic invertebrates) sampling will occur to supplement existing datasets and support any future reviews of human exposure risk to ingestion of biota containing PFAS.

The Northern Territory Department of Health have issued dietary advisories relating to consumption of fish in Rapid Creek and Ludmilla Creek. Monitoring of PFAS concentrations within fish and aquatic species within Rapid Creek is important to ensure that the health guidance provided is appropriate and continues to be relevant.

Ethics approvals and Fisheries/Parks & Wildlife licences will be obtained prior to biota sample collection.

Target species will be based on those that are recognised as frequently consumed from the following three groups:

- Diadromous or estuarine fish (Barramundi, Flathead, Javelin, Sweetlips, Mullet, Rockcod, Queenfish, Jewfish etc)

- Molluscs (Longbums [*Telescopium Telescopium*] and Whelk)
- Crustaceans (Redclaw Crayfish [*C.quadricarinatus*]).

The six suitable locations identified for sample collection, and aquatic biota target species at each location, are presented in **Table 9**, on **Figure 4** in **Appendix B**. and **Table 3** in **Appendix C**.

The sample locations as presented in **Figure 4** (**Appendix B**) are not the exact locations for collection of biota samples but rather the downstream extent of the study reach. The exact location will spread over a couple hundred meters, where possible, but within the same habitat type as the locations identified on **Figure 4** (**Appendix B**) per day of sampling.

Target sample numbers from each location are presented in **Table 9**, however the number of samples collected will vary based on what is caught.

Table 9 Aquatic biota target samples

Location	Sample location code[1]	Indicator/target species	Target sample numbers	Sampling frequency
Rapid Creek – (Freshwater) - Upstream of Trower Road	BIOFA024/ BIOFA026/ BIOFA028 or new location	Crustaceans	Minimum three of at least 100g	Once yearly (End-Dry season or start-Wet season – October - December)
Ludmilla Creek (Estuarine area)	BIOFA016 or new location	Molluscs	Five composite samples of 10 molluscs	
Rapid Creek mouth (Casuarina Drive)	BIOFA007	Diadromous or estuarine fish	Three samples of each of 5 species of commonly consumed fish (15 total)	
Ludmilla Creek Boat Ramp)	BIOFA018	Diadromous or estuarine fish	Three samples of each of 5 species of commonly consumed fish (15 total)	

4.8 Sample collection and handling

4.8.1 Groundwater sampling

The groundwater sampling methodology and schedule are presented in **Table 10**.

Table 10 Groundwater Sampling Methodology and Schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured in each monitoring well prior to collection of groundwater samples. The depth to water to the nearest mm will be measured from the survey mark or highest point of the well casing. The date, time, well condition and any odours will be recorded. Gauging of all locations will be conducted prior to groundwater sampling to enable groundwater contours to be developed. The depth to groundwater will also be measured at the time of sampling at each location. All gauging shall be completed within a 24-hour period.

[1] Note: Biota monitoring location ID's provided in the OMP (Coffey, 2019a) were not compliant with the DCMM guidance and have been updated to meet Defence requirements.

Item	Details
	LNAPL may be detected at some monitoring locations. For wells with potential LNAPL presence use an interface probe to measure depth to water. In the event that LNAPL is detected, measure the thickness and confirm using a disposable bailer.
Sample collection methodology	**Groundwater monitoring wells** Groundwater samples will be collected from monitoring wells using no purge methodology with HydraSleeves™ which will be installed with the top of the HydraSleeve™ collar approximately one-metre below standing water level (SWL) or one-metre below the top of the screened section (whichever is deepest) for a minimum of 24-hours prior to sampling for the initial sampling round. Following sample collection, field parameters will be recorded ex-situ. All Groundwater Wells will be sampled using the HydraSleeves™ method.
QA/QC samples to be collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate samples (where non-dedicated equipment is used), field blanks and trip blanks. Duplicate samples are to be collected at a minimum frequency of 1 in 10 PFAS primary samples. Rinsate samples are to be collected at a rate of one sample per day of sampling when non-dedicated equipment is used, by pouring laboratory supplied PFAS free deionised water over the decontaminated sampling equipment. Field blank samples are to be collected at a rate of one per day of sampling. Trip blanks are to be collected a rate of one per esky. Additional sample volume is required to be collected to enable the appropriate laboratory QA/QC.
Field parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (ORP), pH and observations of water quality will be recorded for all samples.
Sample analysis	All primary samples will be submitted for PFAS extended suite (Department of Defence 2022) using the standard levels of detection.
Sampling schedule	As per **Appendix A**.
Minimum sampling volumes	**Bottle** / **Minimum volume** PFAS Bottle (White) / 2 x 20mL

4.8.2 Surface water sampling

The surface water sampling methodology and schedule are presented in **Table 11**

Table 11 Surface water sampling methodology and schedule

Item	Details
Sample collection methodology	Samples are to be collected, using a telescoping sampling pole with laboratory supplied bottle on the end, from approximately 0.5 m below the surface (if possible), with care to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container should be lowered into the water using a decontaminated sampling pole, with the cap immediately applied once the container is full. Following sample collection, field parameters will be recorded ex-situ by placing the water-meter probe into a separate cup filled with surface water from the collection location.

Item	Details	
QA/QC samples to be collected	Field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate samples (where non-dedicated equipment is used), field blanks and trip blanks. Duplicate samples are to be collected at a minimum frequency of 1 in 10 PFAS primary samples. Rinsate samples are to be collected at a rate of one sample per day of sampling when non-dedicated equipment is used by pouring laboratory supplied PFAS free deionised (DI) water over the decontaminated sampling equipment. Field blank samples are to be collected at a rate of one per day of sampling. Trip blanks are to be collected a rate of one per esky. Additional sample volume is required to be collected to enable the appropriate laboratory QA/QC.	
Field parameters	Temperature, EC, DO, ORP, pH and observations of water quality will be recorded for all samples.	
Sample analysis	All primary samples will be submitted for PFAS Full suite (Department of Defence 2022) using the standard levels of detection.	
Sampling schedule	The monitoring will include 9 monitoring events at Off-Base locations and 7 monitoring events at on-Base locations on an annual basis. Sampling will be completed nominally December/January (Q1, undertaken as soon as practicable after a first flush rain event) and March (Q2), corresponding to start and end of Wet Season (respectively).	
Minimum sampling volumes	PFAS Bottle (White)	2 x 20 mL

4.8.3 Biota sampling

The biota sampling methodology and schedule are presented in Table 12.

Table 12 Biota sampling methodology and schedule

Item	Details
Sample collection methodology	Estuarine fish will be collected using 4-6-inch gill nets set three hours before low tide. Nets will be continuously monitored from a small boat and cleared when movement is detected. Non-target species will be released immediately. Selected biota will be identified, measured, weighed and euthanized humanely according to the animal ethics permit conditions. Redclaw will be captured using Opera House traps baited with raw beef (purchased from supermarket). Traps will be set overnight in freshwater pools and collected early morning. Longbums will be hand-collected during low tide from the mangroves. Redclaw and Longbums will be rinsed, placed in snap-lock bags and euthanised by freezing. Samples will be prepared based on the following procedure: • Rinse equipment with PFAS-free DI water. • Dtore samples in snap-lock bags until preparation. • Weigh, measure and record species and location caught. • target fish and opportunistic catch species: - Use opened bag as board cover. - Clean knife/blade with DI water.

Item	Details
	- Collect 50 – 100 g samples per sample collection bag for each species following lab specifications for total number of samples per species. - For large fish the complete tissue samples of edible flesh should be collected. Samples from large fish should not be composited if possible. - For smaller fish, samples need to be provided whole with entrails removed. Head and tail can be removed from smaller fish where necessary for placing in bags. - Tissue from the same species caught in the same area may be composited as a single sample if individuals do not meet 50g minimum. - Collect rinsate sample after cleaning reusable equipment (run DI water over equipment and collect in PFAS sample bottle). Fill bottle (minimum half filled). • for Redclaw Crayfish: - Rinse in DI water. - Composite whole as 50-100g samples (about 3-5 individuals per sample). • for Longbum: - Place shells inside a sample bag and carefully smash shells with a hammer, then extract tissue with forceps. - Wash tissue with DI water. - Composite 10 individuals as a sample. • Double bag all samples and label inner bag. • Freeze and pack in eskies with frozen water bottles.
QA/QC samples to be collected	Quality control samples in the form of rinsate blanks will be collected from the sampling and processing equipment from each of the sampling areas to understand if there is the potential for cross contamination from the materials being used in sampling. Intra- and inter-laboratory duplicate samples will be collected from large fish across different species, if possible, at a rate of one duplicate sample for every ten fish sampled. Intra- and inter-laboratory duplicate samples will be collected only from fish where a primary complete sample can be taken from one fillet side, and the duplicate sample can be collected from the opposite fillet side.
Sample analysis	Samples will be prepared for analysis by Eco Logical at the Department of Fisheries laboratory prior to dispatching to the primary laboratory. This will include removal of scales/shell, head, and internal organs. Fillets will be taken with skin intact and homogenised prior to sub-sampling and analysis. All whole samples and composites will be tested for the extended suite (Department of Defence 2022) of PFAS. The number of samples analysed are pre-determined and based off the minimum quantity requirements as specified above. Additional samples will be kept frozen until the required analysis or reanalysis is confirmed. Laboratory analysis will be conducted by a NATA accredited laboratory for PFAS (EP231X).

Item	Details
Sampling schedule	The monitoring will include annual monitoring events with sampling completed October/December, corresponding to end of Dry season / start of Wet season.

4.8.4 Sample handling and transport to laboratory

AECOM personnel will attempt to reduce heterogeneity in the sample media matrix by dividing the sample collected between primary and inter/intra-laboratory collection jars or bottles during sampling. All samples will be placed on ice in eskies immediately after sampling. Biota samples will be stored in double zip-lock bags, frozen and packed in eskies with frozen water bottle ice bricks.

All samples will be kept, if possible, at approximately 4°C during transit to the laboratory. Samples will be transported directly to the laboratory for analytical testing under standard Chain of Custody (CoC) procedures. Primary and field QA/QC samples (except inter-laboratory duplicate samples) will be analysed by Australian Laboratory Services (ALS), a National Association of Testing Authorities (NATA) accredited laboratory. The inter-laboratory duplicate samples, if feasible to collect, will be analysed by National Measurement Institute (NMI), also a NATA accredited laboratory. Due to the nature of biota samples, it isn't always feasible to collect inter-laboratory samples, however, field staff will attempt to collect inter-laboratory samples if enough biota sample material is available.

Prior to sampling, assessment of the analytical holding times will be made, and the sampling planned accordingly to ensure that holding times are not breached or minimised.

4.9 Calibration

The water quality meter will be calibrated prior to field mobilisation for field activities with relevant solutions, including pH, EC and ORP. The calibration will be in accordance with manufacturers' instructions or NATA publication "General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note N0. 19 (NATA 1994)". Where satisfactory calibration cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration details will be recorded on a calibration record sheet and included in the Sampling Events Factual Reports.

4.10 Logistics

The laboratory sample containers will be shipped from the laboratory to the AECOM office in Darwin prior to the commencement of fieldwork. All primary samples will be transported by an ALS supplied courier at the completion of fieldwork. All inter-laboratory duplicate samples will be transported with the primary samples, then separated and couriered directly to the secondary laboratory (NMI, Sydney) by ALS under a separate CoC for analysis.

4.11 Analytical suite and laboratory analysis methods

4.11.1 Laboratory NATA accreditation details

Laboratory Sampling analysis is to be conducted using NATA certified laboratories which will implement a quality control plan in accordance with NEPM (2013).

4.11.2 Analytical schedule

All media sampled shall be analysed for the extended PFAS suite (Department of Defence, 2022) with standard LOR as outlined in **Table 13** below.

Table 13 Sample Analytical Suite for PFAS

PFAS group	Compound	CAS No.
Perfluoroalkyl Sulfonic Acids	Perfluorobutane sulfonic acid (PFBS)	375-73-5
	Perfluoropentane sulfonic acid (PFPeS)	2706-91-4
	Perfluorohexane sulfonic acid (PFHxS)	355-46-4

PFAS group	Compound	CAS No.
	Perfluoroheptane sulfonic acid (PFHpS)	375-92-8
	Perfluorooctane sulfonic acid (PFOS)	1763-23-1
	Perfluorodecane sulfonic acid (PFDS)	335-77-3
Perfluoroalkyl Carboxylic Acids	Perfluorobutanoic acid (PFBA)	375-22-4
	Perfluoropentanoic acid (PFPeA)	2706-90-3
	Perfluorohexanoic acid (PFHxA)	307-24-4
	Perfluoroheptanoic acid (PFHpA)	375-85-9
	Perfluorooctanoic acid (PFOA)	335-67-1
	Perfluorononanoic acid (PFNA)	375-95-1
	Perfluorodecanoic acid (PFDA)	335-76-2
	Perfluoroundecanoic acid (PFUnDA)	2058-94-8
	Perfluorododecanoic acid (PFDoDA)	307-55-1
	Perfluorotridecanoic acid (PFTrDA)	72629-94-8
	Perfluorotetradecanoic acid (PFTeDA)	376-06-7
Perfluoroalkyl Sulfonamides	Perfluorooctane sulphonamide (FOSA)	754-91-6
	N-Methyl perfluorooctane sulfonamide (MeFOSA)	31506-32-8
	N-Ethyl perfluorooctane sulfonamide (EtFOSA)	4151-50-2
	N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)	2448-09-7
	N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE)	1691-99-2
	N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)	2355-31-9
	N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)	2991-50-6
(n:2) Fluorotelomer Sulfonic Acids	4:2 Fluorotelomer sulfonic acid (4:2 FTS)	757124-72-4
	6:2 Fluorotelomer sulfonic acid (6:2 FTS)	27619-97-2
	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	39108-34-4
	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	120226-60-0

The current standard laboratory limits of reporting (LOR) are described in **Table 14** below.

Table 14 Laboratory Limits of Reporting

Sample media	Parameter	Technique/method reference	LOR*
Groundwater and Surface Water	Extended PFAS Suite (Department of Defence 2022)	LC/MS-MS	0.01 – 1.0 µg/L
Biota	Extended PFAS Suite (Department of Defence 2022)	EP231X	0.5 – 5 µg/kg

LC/MS-MS = Liquid chromatography–mass spectrometry
*LOR for Australian Laboratory Services (ALS)

4.12 Sample nomenclature

In order to meet Defence data management requirements presented in **Section 4.0** of **Annex L** of the Defence Contamination Management Manual (DCMM) (Department of Defence, 2021), a consistent sample nomenclature has been adopted for the program. All samples collected from each location should have a unique identification. The minimum mandatory requirements for the sample identifications are outlined in **Table 15**, further examples relevant to this SAQP are outlined in **Table 16**.

Table 15 Mandatory requirements for Defence sample nomenclature

Sample ID	Location ID
PPPP_XX000_ZZZ_YYMMDD	XX000
e.g. 1302_BH001_1.2_190207	e.g. BH001
Reference	
PPP – property identification (4-digits) XX – type of sample recovery 000 – location specific identification ZZZ – indicates the depth that the sample has been collected (in meters below ground level [bgl] YYMMDD – date of sample collection	

Table 16 Sample Abbreviations

Abbreviation	Meaning	Matrix	Examples of methods of sampling	Example sample name/comments
MW	Monitoring Well	Water or Soil	Groundwater	1302_MW104_180630
SW	Surface water	Water	Surface water	1302_SW002_180630
BIOAFA	Biota	Aquatic Fauna	Fish, crustaceans, invertebrates and their products; blood, roe etc	1302_BIOAFA001_190806

4.12.1 Quality assurance / quality control sample nomenclature

The naming convention for QA/QC samples are outlined in **Table 17**, below.

Table 17 QA/QC sample naming convention

QA/QC sample type	Naming convention (where XX is a sequential number independent of sample or matrix type)
Quality control duplicate samples	
Intra-Laboratory duplicate (duplicate)	1302_QC1XX_YYMMDD
Inter-Laboratory duplicate (triplicate)	1302_QC2XX_YYMMDD
Quality assurance samples	
Rinsate	1302_QC3XX_YYMMDD
Field Blank	1302_QC4XX_YYMMDD
Trip Blank	1302_QC5XX_YYMMDD

4.13 Defence ESdat requirements

Defence has contracted Earth Science Information Systems (EScIS), to provide contamination data management services through a cloud instance of its ESdat product.

All OMP (Coffey, 2019a) field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's ESdat database in accordance with Section 6 of Annex L to the Defence Contamination Management Manual. AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will upload the data from each monitoring event into ESdat prior to submitting the Sampling Event Factual Report.

4.14 Adopted screening criteria

PFAS screening values have been adopted for groundwater and surface water from the Defence OMP (Coffey, 2019a) and are derived from the following documents:

- HEPA (2020) PFAS NEMP 2.0
- Department of Health (DoH), 2019. Health Based Guidance Values for PFAS for use in site investigations in Australia. September 2019
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC 2019)
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM).

Adopted PFAS screening values are provided in the **Table 18**.

Table 18 Adopted groundwater and surface water screening values (µg/L)

Pathway	Compound	Criteria	Comment / reference
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	
Intake – food (Crustaceans)	Sum of PFOS+PFHxS	65 µg/kg	These values are from the Department of Health, 2019. *All biota samples will be compared to these criteria*.
	PFOA	520 µg/kg	
Intake – food (Finfish)	Sum of PFOS+PFHxS	5.2 µg/kg	
	PFOA	41 µg/kg	

Table 19 PFAS Criteria Summary: Ecological

Media	Pathway	Chemical	Criteria	Comment/reference
Water	Freshwater	PFOS	0.00023 µg/L	HEPA (2020) NEMP 2.0 99% species protection
		PFOA	19 µg/L	HEPA (2020) NEMP 2.0 99% species protection

Note: HEPA (2020) notes that the 99% species protection level for PFOS is close to the level of detection. Agencies may wish to apply a 'detect' threshold in such circumstances rather than a quantified measurement.

4.15 Waste management

Due to the proposed "no purge" sampling methodology, it is not anticipated that significant volumes of liquid waste would be generated that would require management or disposal.

Single use sampling equipment and any waste generated during works (including generation of wastewater or soil) will be managed and/or disposed of appropriately in accordance with Territory waste disposal requirements.

4.16 Quality assurance/quality control sampling

The recommendations within this document are based on the guidelines presented in:

- NEPM [the National Environment Protection (Assessment of Site Contamination) Measure 1999] as amended in 2013
- HEPA (2020) PFAS National Environmental Management Plan (NEMP) 2.0
- AS4482.1 Guide to the sampling and investigation of potentially contaminated soil, Part 1: Non-Volatile and Semi-Volatile Substances
- AS4482.2 Guide to the sampling and investigation of potentially contaminated soil, Part 2: Volatile Substances
- AS/NZ 5667.1 Water Quality Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handing of samples
- ANZG (2018). Guidelines for Fresh and Marine Water Quality
- ANZECC& ARMCANZ (2000). Australian and New Zealand guidelines for fresh and marine water quality
- WA DER (2016). Interim Guideline on the Assessment and Management of Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS)

4.16.1 Field intra- and inter-laboratory duplicate samples

Intra-laboratory field duplicates will be collected at a frequency of one per ten samples that are collected (10%). Inter-laboratory field duplicates will be collected for groundwater and surface water samples at a rate of one sample per ten collected (10%). Biota intra-laboratory and inter-laboratory duplicate samples will be collected where fish are large enough, left and right fillets will be used as a duplicate sample for quality control analysis. Biota intra- and inter-laboratory will be collected at a minimum frequency of 1 per 10 primary samples. Due to the sample size of fish fillets not being large enough, intra- and inter-laboratory duplicates will be collected from different primary samples. The samples will be sent to a secondary laboratory once one is identified that offer the analysis of fish samples. Repeatability will be assessed by relative percentage difference (RPD) between primary and duplicate samples. If RPD has variability greater than 30% the sample will be reviewed. The minimum volume of intra- and inter-duplicate samples is to follow the below requirements set by the primary and secondary laboratories.

Rinsate samples will be prepared in the field using laboratory prepared bottles and PFAS free deionised water, poured over (if any) decontaminated sampling equipment (e.g. oil/water interface probe or hand trowel). Rinsate samples will be collected at a frequency of one per sampling day, where reusable sampling equipment has been used.

4.16.2 Rinsate samples

Rinsate samples will be prepared in the field using laboratory prepared bottles and PFAS free deionised water, poured over (if any) decontaminated sampling equipment (e.g., oil/water interface probe or hand trowel). Rinsate samples will be collected at a frequency of one per sampling day, where reusable sampling equipment has been used.

4.16.3 Field blank samples

Field blank samples will be prepared in the field using laboratory prepared bottles and PFAS free deionised water to capture any potential air-borne contaminants of concern. These will be collected at a frequency of one per sampling day for water sampling.

4.16.4 Trip blank samples

The trip blank water samples will be laboratory supplied and prepared in a clean environment, taken at a rate of one per esky, and will remain within the sample esky during the entire sampling event until arriving at the laboratory for analysis.

4.16.5 Laboratory QA/QC

Additional sample volumes will be obtained to enable laboratory QAQC (duplicates and matrix spike) for PFAS analysis. The frequency of additional samples is 2:10 and 3:20, where two additional sets (2x20mL) are required per 10 primary samples, or three sets per 20 primary samples.

4.17 Fieldwork documentation

4.17.1 Field observations and results

Field notes will be maintained to record all field sampling events and include observations made at each sample location. Field notes will include information specific to the sample media as follows:

- Groundwater Samples – comments on the observed characteristics of the sample (e.g. colour, turbidity, odour, sheen) and reported field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded at regular intervals
- Surface Water Samples – comments on the observed characteristics of the sample (e.g. colour, turbidity, odour, sheen), relative flow velocity, descriptions of water body, channel width, and field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded
- Biota samples – comments on field conditions (weather, tidal movements) and the observed characteristics of the sample

The geo-coordinates for each sample location will be noted. The location of quality control (e.g. duplicate and inter-laboratory duplicate) sample collection points will also be noted.

AECOM's tablet-based Environmental Data Collection and Analysis ('EDCA') tool or ALS' phone/tablet based data collection tool, Compass, will be utilized by field staff to capture consistent field data based on project specific requirements, minimise potential data transcription errors, allow on-the-spot identification of potentially erroneous data in comparison to historical data and facilitate efficient data transfer to multiple data systems including ESdat.

4.17.2 Sample labels

Sample containers will be labelled, as a minimum, with the following information:

- AECOM project number
- Name of sampler
- Sample ID
- Date of sample collection
- Filtered vs non-filtered (for water samples only).

An indelible felt pen will be used for labelling, to ensure that the lettering is not erased during transit to the laboratory.

AECOM will utilize the tablet-based EDCA tool or ALS' phone/tablet based data collection tool, Compass, to streamline sample labelling and chain of custody (CoC) creation to ensure compliant sample IDs are used in the field.

4.17.3 Chain of custody forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory.

The CoC form will include the following information:

- Job number (Note: the name of the site is not identified for confidentiality purposes)
- Date and time of sample collection
- Sample ID
- Type of containers
- Name of sampler
- Laboratory to be used
- Analyses required
- Any comments
- Signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the field team, (i.e. samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed and the due date for the analytical results.

4.17.4 Sampling documentation

Field sampling sheets will be completed for each location, and will include the following information (as appropriate for the media being sampled):

- name of sampler
- sample location
- date /time of monitoring/ sampling
- sampling method
- observations of the sampled media
- calibration records.

Records of all equipment calibration will be included in the Sampling Event Factual Reports.

4.18 Reporting

4.18.1 Sampling event factual report

No later than four weeks following the completion of each sampling event, AECOM will prepare and submit a Sampling Event Factual Report to Defence. A sampling event is defined as all sampling activities occurring in association with a PMAP defined season (i.e. end of dry / start of wet season), which can include groundwater, surface water, and / or biota sampling occurring at different times throughout a specified season as is appropriate for each sampling type.

Each Sampling Event Factual Report will include:

- details of the scope of monitoring completed.

- a description of the sampling methodologies used.
- a summary of observations made while sampling (e.g. any visual or olfactory observations that may indicate impacts to surface water or groundwater).
- a summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement of decommissioning of a location.
- a presentation of the analysis results in a table that includes comparisons with PFAS guidelines, highlighting any significant statistical deviations from historical monitoring and investigation data.
- a presentation of the reduced groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction.
- discussion of the analytical data quality, including review of the quality control sampling results and laboratory quality control data.
- inclusion of the following information as attachments:
    - Groundwater, surface water and biota sampling forms including field water quality parameter measurements
    - Chain of custody forms
    - figures
    - tables
    - Laboratory analytical certificates
    - Equipment calibration certificates.

4.18.2 Annual monitoring and management report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Annual Interpretive Report to Defence. Each Interpretive Report will include:

- evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Coffey, 2019a).
- relevant figures depicting sampling locations and site-specific hydrogeological features.
- laboratory results and analysis including comparison with relevant screening criteria as identified in each OMP (Coffey, 2019a).
- assessment and commentary on appropriate QA/QC procedures.
- a review of the Conceptual Site Model and provision of a revised Conceptual Site Model if required.
- data interpretation, including trends in groundwater concentration, gradient and flow directions.
- assessment of statistically based trends that may inform decision making when it comes to the revision of an OMP (Coffey, 2019a).
- a statement as to whether the risk profile has changed overall, or for any specific location at the Site, and a recommendation as to whether this should trigger an OMP (Coffey, 2019a) and/or PMAP (Coffey, 2019a) review, or other action.

Following sampling occurring on Darwin International Airport controlled property, a letter report will be provided to Defence to send to Darwin International Airport management. This letter report will not be included in any other report and are strictly for communicating results to Darwin International Airport regarding results from samples collected from the individual stakeholders' properties. OMP Review

4.18.3 OMP review

Review of ongoing management at the Base for the release to the government and public stakeholders. The report should contain the following information:

- identification of improvements to the OMP (Coffey, 2019a) procedures in light of observed variability or concentration changes.
- review of data gaps and nomination of measures to address significant gaps.
- review of Changes in Australian or international practice and guidance in PFAS investigation.
- reporting of changed conditions that require mitigation or warrant review of risk assessments.

4.19 Deviations from OMP

While the scope of works and methodology described in this SAQP are generally consistent with that presented in the OMP (Coffey, 2019a), a number of points of deviation are noted (refer to **Table 20** below).

Table 20 Deviations from OMP

No.	Description	Rationale
1	Adoption of Revised Recreational Screening Criteria for PFOS+PFHxS and PFOA (2019)	Following the release of the OMP (Coffey, 2019a) in July 2019, the National Health and Medical Research Council (NHMRC), published guidance on PFAS in Recreational Water. The adopted screening criteria for PFOS+PFHxS and PFOA in surface water have therefore been revised to 2 µg/L and 10 µg/L, respectively. This is reflected in Section 4.13.
2	Sampling of groundwater and surface water for the non-PFAS suite (Department of Defence 2022). (2021)	Defence notified the AECOM project management team via email on 27th January 2021 that "*all future OMP sampling events across all sites, the inclusion of non-PFAS analysis will need to be justified in advance and agreed by Defence Tech Policy through review of the SAQP*".
2	Sampling of monitoring location MW190 (2021)	Monitoring location MW193 was destroyed during construction activities related to road improvements north of DIA. MW190 was determined to be the best existing alternative location to replace MW193.
3	Sampling of monitoring location SW152 (2021)	Monitoring location SW101 has been made inaccessible through the installation of a security fence surrounding the airfield areas of RAAF Base Darwin. As such, the closest accessible point to collect surface water samples from upper Rapid Creek downgradient of the runway areas is SW152.
4	Sampling of monitoring location MW405 (2021)	Monitoring location MW405 was destroyed during construction activities related to the AIR7000 redevelopment project. MW215 was determined to be the best existing alternative location to replace MW405.
5	Sampling of monitoring locations MW451, MW452, MW453 and MW454 (2022)	Defence notified the AECOM project management team with the recommendation to include four new monitoring wells to the OMP (Coffey, 2019a) scope of work to address identified data gaps and recommendations from previous sampling rounds. The proposed wells will be sampled biannually, at the end of the wet season (March) and the end of the dry season (Oct - Dec).

No.	Description	Rationale
6	Increased sampling frequency of existing monitoring locations SW109 and SW170 (2022)	Defence notified the AECOM project management team with the recommendation to conduct additional sampling of existing locations to address identified data gaps and recommendations from previous sampling rounds. Monthly sampling of SW170 and SW109 must be undertaken throughout the wet season (Dec – April). Monthly samples must also be recorded for SW109 during June and August.
7	Additional surface water location SW300 (2022)	Defence notified the AECOM project management team with the recommendation to include one additional surface water locations to the OMP (Coffey, 2019a) scope of works to address identified data gaps and recommendations from previous sampling rounds.
8	Additional surface water location SW312 (2022)	Defence notified the AECOM project management team with the recommendation to include one additional surface water locations to the OMP (Coffey, 2019a) scope of works to address identified data gaps and recommendations from previous sampling rounds.

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) outlined in the *PFAS Management Area Plan (PMAP)* (Department of Defence, 2019a) at the Royal Australian Air Force (RAAF) Base Darwin (the 'Base') in the Northern Territory (NT). The location of the Base and Management Area is shown in Appendix A – Figure 1. The OMP (Department of Defence, 2019a) for the Base outlines the requirement to complete biannual groundwater, biannual surface water sampling and annual biota.

The primary purpose of the OMP is to monitor changes to the PFAS impact in groundwater and surface water pathways associated with sources of PFAS as initially assessed through the detailed site investigation phase of works. Changes may result from the specific or cumulative impact of remediation or containment actions, existing transportation trends, and changes to hydrogeology or weather events.

The monitoring program at the Base includes a regime of groundwater, surface water and biota sampling to capture these changes in the long term, to enable Defence to maintain an up-to-date understanding of temporal and spatial distribution, concentration, and transport of PFAS contaminants.

The most recent PFAS OMP approved in 2019 that is covered within the PMAP (Department of Defence, 2019a), outlines the requirement to conduct annual biota sampling, biannual groundwater sampling and surface water sampling up to four times a year as presented in Table 1 below.

Table 1 Annual sampling schedule with dry season sampling highlighted in yellow.

Sampling	Wet Season				Dry Season						Wet Season	
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Groundwater			Biannual							Biannual		
Surface Water			End of Wet									Start of Wet
	Monthly in Wet	Monthly in Wet	Monthly in Wet	Monthly in Wet								Monthly in Wet
						Twice in Dry		Twice in Dry				
Aquatic Biota										Annual Biota		

1.2 Objectives

The purpose of this factual report is to summarise the scope of works and findings from the dry season sampling works conducted between August 2023 and October 2023. The planned works included:

- Twice in dry season surface water sampling during June and August 2023 in accordance with the Sampling Analysis and Quality Plan (SAQP), Revision 2 (AECOM, 2023a).
- Biannual groundwater sampling in October 2023 in accordance with the SAQP, Revision 3 (AECOM, 2023b).
- Annual aquatic biota sampling in October 2023 in accordance with the SAQP, Revision 3 (AECOM, 2023b).

This report has been prepared in accordance with the Defence's PFAS OMP Factual Report Guidance, (Department of Defence, 2021b).

An Ongoing Monitoring Report (OMR) is to be subsequently developed for the purpose of assessing the data collected during the discrete monitoring events completed over the 12-month period within which

the works detailed herein fall and will include assessment of environmental variability and statistically significant trends in PFAS concentrations.

2.0 Scope of Work

2.1 Overarching scope

The 2023 dry season sampling events were completed in general accordance with the SAQP (AECOM, 2023b); see Section 2.3 for deviations from the SAQP. Prior to commencement of the sampling events, the SAQP (AECOM, 2023b) was reviewed to ensure compliance with the following:

- The OMP (Department of Defence, 2019a).
- PFAS National Environmental Management Plan (NEMP 2.0) (HEPA, 2020).
- National Environment Protection Council 1999, National Environment Protection (Assessment of Site Contamination) Measure, Amendment 1 2013 (ASC NEPM, 2013).
- Defence Routine Environment Water Quality Monitoring Manual (Department of Defence, 2019b).
- AS/NZ 5667:1998 Water quality – Sampling (AS/NZS, 1998).
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018).
- Relevant Territory regulatory guidelines.

The scope of works completed for the dry season sampling events included:

- Surface water sampling of one 'twice in dry season' location in August 2023 (refer to Table 2 and Appendix A – Figure 2 for the specific location).
- Gauging and groundwater sampling of 28 biannual locations (refer to Table 3 below and Appendix A – Figure 3 for specific locations).
- Collection of aquatic biota samples from six annual locations (refer to Table 4 below and Appendix A – Figure 5 for specific locations).
- Collection of relevant quality assurance and quality control samples (QA/QC).
- Analysis of all samples for a suite of 28 PFAS analytes at the standard limit of reporting (LOR).
- Data management of the OMP field and laboratory data in the Defence ESdat database.
- Preparation of this Sampling Event Factual Report.

2.2 Monitoring locations

The monitoring locations outlined within the relevant SAQP (AECOM, 2023b) for the dry season sampling events are tabulated below. Deviations from the planned sampling are highlighted in **bold** and detailed in Section 2.3 below.

Table 2 Twice in dry season surface water location for June and August 2023 (AECOM, 2023b)

Area	Description	Sampling locations
Off Base	Rapid Creek	**SW109**

Table 3 Biannual groundwater sampling locations sampled in October 2023 (AECOM, 2023b)

Area	Description	Sampling locations
OnBase	Former Fuel Farm 1	MW215
	Former Fuel Farm 5	MW297, **MW112*****
	Former Fuel farms	MW303, MW133, MW205
	Former Fire Training Area 1	**MW422***, MW139

Area	Description	Sampling locations
	Current Fire Training Area	**MW240****, **MW241****
	RAAF Fire Station	MW103
	Former ARFF Fire Station	MW115
	Source area downgradient transect	MW107, MW128
	Southern boundary of Base	MW141, MW144
	Western boundary of Base	MW148
	Rapid Creek – Eastern end	MW156
	Western boundary of Base	MW451, MW452
	Current Fire Training Area	**MW453****
	Former Fire Training Area 1	MW454
Off Base	Former Fire Training Area 2, Darwin International Airport (DIA)	**MW197****
	Off-Base (north)	MW185
	Rapid Creek	MW190, MW191, MW194, MW195
	Off-Base (south)	MW176, MW180, MW200, MW209
	Off-Base (southwest)	MW211
	Off-Base (west)	MW210

* Contingency location MW235 gauged in lieu of MW422 due to no access, but not sampled due to damage.

** Wells gauged dry and were not sampled.

*** Wells inaccessible due to the site being buried by earthworks occurring in the area

Table 4 Annual biota sampling locations (AECOM, 2023b)

Area	Description	Sampling locations	Indicator/target capture
Off Base	Rapid Creek Freshwater – Upstream of Trower Road	BIO024, BIO026, BIO028	Crustaceans
	Ludmilla Creek – Estuarine area	BIO016	Molluscs
	Rapid Creek mouth – Casuarina Drive	BIO007	Diadromous or estuarine fish
	Ludmilla Creek – Boat Ramp	BIO018	Diadromous or estuarine fish

2.3 Deviations from the SAQP

The works completed during the dry season sampling events included some deviations from the SAQP as outlined below in Table 5

Table 5 Deviations from the SAQP during sampling events

SAQP	2023 sampling event	Impact to OMP
Sampling of SW109 twice in dry season	Monitoring location SW109 was not sampled in June 2023.	Minor impact – data gap for June 2023 PFAS concentrations going off Base to Rapid Creek. However, SW109 was sampled during August 2023 event and historical data is available for this location for June in previous years.
Sampling 28 of 34 biannual groundwater locations.	Monitoring location MW112 was not sampled due to runway upgrades. The location is suspected to be underneath earth works.	Minor impact – data for MW112 may have a minor impact on the understanding the concentration changes within the source area. The monitoring well has previously been sampled in the dry season. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring location MW235 was an alternative for MW422 which was dry. MW235 has a bent PVC casing so only gauging results were recorded with no HydraSleeve™ able to be deployed.	Minor impact – data gap for MW235/MW422 may have a minor impact on understanding the concentration changes within the source area. The monitoring well has previously been sampled in the dry season. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring locations MW197 was dry and not able to be sampled. Monitoring location MW236 is the alternative monitoring location for MW197 and was also dry.	Minor impact – data gap for MW197 may have a minor impact on understanding the concentration changes within the source area. The monitoring well has previously been sampled in the dry season. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring location MW240 was dry and not able to be sampled. No alternative monitoring wells are provided within the SAQP for this location.	Minor impact – data gap for MW240 may have a minor impact on understanding the concentration changes within the source area. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring location MW241 presented as dry during the October 2023 sampling event. No alternative monitoring locations are offered for MW241.	Minor impact – data gap for MW241 may have a minor impact on understanding the concentration changes within the source area. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring location MW453 presented as dry and was not able	Minor impact – data gap for MW453 may have a minor impact

SAQP	2023 sampling event	Impact to OMP
	to be sampled. No alternative monitoring locations are offered for this location.	on understanding the concentration changes within the source area. Furthermore, there are other monitoring locations hydraulically downgradient from this location.
	Monitoring location MW128 was gauged and sampled at a later date to other locations due to a delay in obtaining gate keys from Base Management.	No impact - The sampling of MW128 in early November 2023 instead of in October 2023 with the other monitoring locations is not considered to have an impact on the data due to limited recorded precipitation between events and therefore groundwater conditions would still reflect dry season conditions.
Water quality parameter collection for groundwater	The water quality parameter data at monitoring location MW205 for dissolved oxygen was lost due to electronic data collection fault, where the data was not saved and could not be retrieved.	Minor impact - The lack of dissolved oxygen parameters for MW205 is considered to have minimal impact on the data set.
	The water quality parameter data at monitoring location MW128 was misplaced.	Minor impact - The lack of parameter data at monitoring location MW128 is considered to have minimal impact on the data set.
QA/QC for biota sampling	A field blank sample was not collected during the biota sampling event.	Minor impact - A field blank sample was not collected as per the project specifications. The accuracy of the data can be considered acceptable based on available rinsate and trip blank samples that were reported at the required frequencies and within control limits.

3.0 Sampling methodology

The methodology adopted for the dry season sampling events were in accordance with the relevant SAQPs (AECOM, 2023a) (AECOM, 2023b) and is summarised below in Table 6.

Table 6 Sampling methodology

Item	Details
Surface water sampling methodology	
Water quality parameters	Where appropriate, water quality parameters were recorded ex-situ using a calibrated YSI Pro Series water quality meter. Parameters recorded consisted of the following: temperature [degrees Celsius (°C)], electrical conductivity (EC), dissolved oxygen (DO), Redox and pH.Observations of odour, colour, and turbidity of surface water were recorded at each sampling location. Refer to Appendix B – Table 1 for surface water field results and Appendix C for calibration records for the water quality meter and sampling logs.
Sampling methodology	Surface water samples were collected from approximately 0.5m below the surface, when possible. When not possible samples were collected mid-way through the water column to minimise collection of sediment or floating materials in the samples. At SW109 location, a new, laboratory supplied container was lowered into the water, using a decontaminated aluminium sampling pole, with the cap immediately applied once the container was full.
Sample analysis	ALS Sydney, New South Wales (NSW) was used as the primary laboratory. National Measurement Institute (NMI) Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses are certified by the National Association of Testing Authorities (NATA). Chain of custody and laboratory reports are presented in Appendix D.
QA/QC samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate, field blank and trip blank samples. Refer to Appendix E for data validation report.
Groundwater sampling methodology	
Groundwater gauging	The depth to groundwater was measured in each monitoring well prior to deploying the HydraSleeve™ using a decontaminated oil/water interface probe.
Water quality parameters	Groundwater water quality parameters were recorded ex-situ, using a daily calibrated YSI Pro Series water quality meter. Parameters recorded included temperature, EC, DO, redox potential and pH. The odour, colour, and clarity (turbidity) of groundwater were recorded at each sampling location. Refer to Appendix B – Table 3 for groundwater field results and Appendix C for calibration records for the water quality meter and the field logs.
Sampling methodology	Groundwater samples were collected from all accessible wells using no-purge methodology HydraSleeves™. All HydraSleeves™ were installed within the screened interval of the well 1 metre below the standing water level for a minimum of 24 hours prior to sampling as stated in the SAQPs (AECOM, 2023a) (AECOM, 2023b).
Sample analysis	ALS Sydney, NSW was used as the primary laboratory. NMI Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses are certified by the NATA. Chain of custody and laboratory reports are presented in Appendix D.
QA/QC samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate, field blank and trip blank samples. Refer to Appendix E for data validation report.

Item	Details
Aquatic biota sampling	
Aquatic biota target samples	Target species for each identified sample location were based on those that are recognised as consumed by the public from the following three groups: • Diadromous or estuarine fish (Barramundi, Flathead, Javelin, Sweetlips, Mullet, Rock Cod, Queenfish, Jewfish, etc.) • Molluscs [Longbums (Telescopium) and Whelk] • Crustaceans [Redclaw Crayfish (C. quadricarinatus.)]
Aquatic biota sampling methodology	Sampling was conducted by Eco Logical Australia Pty Ltd and the NT Department of Fisheries between 17 to 25 October 2023. Ethics approvals and Fisheries/Parks & Wildlife licenses were obtained prior to biota sample collection. Estuarine fish were collected using 4-6-inch gill nets set three hours before low tide. Nets were continuously monitored from a small boat and cleared when movement was detected. Any non-target species were released immediately and where targeted biota species were identified, they were measured, weighed and euthanised humanely in accordance with the animal ethics permits conditions. Redclaw were captured using Opera House traps baited with raw beef (purchased from a supermarket). Traps were set overnight in freshwater pools and collected in the early morning. Longbums were hand-collected during low tide from the mangroves. Redclaw and Longbums were rinsed prior to being stored in snap-lock bags, euthanised by freezing and preserved frozen until preparation at NT Department of Fisheries wet room laboratories. Samples were prepared for analysis at the NT Department of Fisheries laboratory prior to dispatching to the primary laboratory. This included the removal of scales/shell, head, and internal organs. Fillets were taken with skin intact and homogenised prior to sub-sampling and analysis. Samples were prepared based on the following procedure: • For Target fish: - Used opened bag as board cover. - Cleaned knife/blade with deionised water. - For large fish the complete tissue samples of edible flesh was collected. - For smaller fish, samples were provided whole with entrails removed. • For Redclaw Crayfish: - Rinsed in deionised water. - Composited whole as 50-100g samples (about 3-5 individuals per sample). • For Longbum: - Shells placed inside a sample bag and carefully smashed with a hammer, then tissue extracted with forceps. - Tissue rinsed with deionised water. - Composited 10 individuals as a sample. The weight, length, species, and location caught were recorded.
Sample analysis	ALS Sydney, NSW was used as the primary laboratory. NMI Sydney, NSW was used as the secondary laboratory. ALS and NMI methods for analyses are certified by the NATA. Chain of custody and laboratory reports are presented in Appendix D.
QA/QC samples	Field QA/QC samples collected included intra- and inter-laboratory duplicates, field and trip blanks. Refer to Appendix E for data validation report of the results.

3.1 Adopted screening criteria

The adopted screening criteria references the PFAS National Environmental Management Plan 2.0 (NEMP 2.0) (HEPA, 2020), Defence estate and environmental strategies, and Defence PFAS-specific

strategies and guidance. At the time of preparing this report, the primary guidance document utilised is the *PFAS National Environmental Management Plan (version 2.0)* (NEMP) (HEPA, 2020). Guidance documents used to assess the dataset includes the following:

- Department of Health, 2019. Health based guidance values for PFAS for use in site investigations in Australia. (Department of Health, 2019).
- Heads of the Environment Protection Authority (HEPA), 2020. PFAS NEMP 2.0. (HEPA, 2020).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water (NHMRC, 2019).

The screening criteria which have been adopted for groundwater and surface water are presented in Table 7.

Table 7 Summary of adopted water screen criteria for groundwater and surface water

Pathway	Compound	Criteria	Comment/Reference
Human health receptors			
Drinking water	perfluorooctane sulfonate (PFOS) + Perfluorohexane sulfonate.(PFHxS)	0.07 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). *All surface water and groundwater results will be compared to these criteria.*
	Perfluorooctanoic acid (PFOA)	0.56 µg/L	
Recreational use	PFOS + PFHxS	2 µg/L	The values presented in the PFAS NEMP 2.0 (HEPA, 2020) are from the Guidance on PFAS in Recreational Water (NHMRC, 2019) guidance on the assessment of PFAS in recreational water released in August 2019. *All surface water and groundwater results will be compared to these criteria.*
	PFOA	10 µg/L	
Ecological receptors			
Freshwater (99% species protection values)	PFOS	0.00023 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value. *All surface water and groundwater results will be compared to these criteria.*
	PFOA	19 µg/L	

Notes: HEPA (2020) notes that the 99% species protection level for PFOS is close to the level of detection. Agencies may wish to apply a 'detect' threshold in such circumstances rather than a quantified measurement. The laboratory PFOS LOR adopted in this report is 0.001 µg/L.

The screening criteria which have been adopted for aquatic biota are presented in Table 8 below.

Table 8 Summary of adopted screening criteria for consumption of aquatic biota.

Pathway	Compound	Criteria*	Comment/reference
Human health receptors			
Crustaceans	PFOS + PFHxS	65 µg/kg	Department of Health (2019) *Derivation: Children 2-6 years, median consumption* Occasionally consumed food. Trigger criteria for investigation for crustaceans apply to molluscs due to the small number of consumers of molluscs.
	PFOA	520 µg/kg	
Finfish	PFOS + PFHxS	5.2 µg/kg	Department of Health (2019). *Derivation: Children 2-6 years, P90 consumption*
	PFOA	410 µg/kg	

*Criteria is presented in mg/kg within Appendix B – Table 5 to match laboratory reporting.

3.2 Data quality objectives and data validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2023a) (AECOM, 2023b).

Data validation procedures employed in the assessment of the field and laboratory QA/QC data are indicative that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report subject to the following limitations:

- Elevated relative percentage differences (RPDs) should be taken into consideration when interpreting concentrations for PFOS close to guidelines for primary batches ES2337724, ES2338712 and ES2329252.
- The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR for primary samples 1302_MW209_231031 and 1302_MW451_231031. This should be taken into consideration when interpreting data and using data quantitatively.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) (Department of Defence, 2021a) Annex L requirements.

Full data validation assessment is provided in Appendix E.

4.0 Field observations and results

4.1 Surface water

4.1.1 Field observations and field measurements

Table 9 Surface water observations and field measurements for August 2023 event

Item	Observations and field measurements
Fieldwork dates	The surface water sample and water quality parameters were collected on 30 August 2023.
Access and sample collection	The surface water location was accessible and able to be sampled on 30 August 2023.
Field observations	Rapid creek system had low flows with low turbidity. A cloudy organic sheen was observed on the surface of the water.
Rainfall	No rainfall was recorded at the Darwin Airport during the month of August 2023 (Bureau of Meteorology (BOM), 2023).
Surface water flow	Surface water flow was low in the Rapid Creek system. Upstream of the Rapid Creek system was stagnant with downstream having low observable flow.
Estate works or training activities	During the sampling event, no notable estate works, or training activities were observed in the vicinity of sampling locations.
Water quality parameters	Surface water quality parameters for monitoring location SW109 were measured after the collection of surface water samples. The stabilised readings are presented in Appendix B – Table 1 and are summarised below: • DO was 0.64 mg/L indicating low oxygenated conditions. • EC was 100.6 µS/cm indicating low salinity. • pH was 6.01 indicating slightly acidic conditions. • Redox (corrected) was 257.5 mV indicating reducing conditions.

4.1.2 PFAS surface water analytical results

The August 2023 sample from SW109 reported Sum of PFHxS+PFOS concentration above the laboratory LOR and above the PFAS NEMP 2020 drinking water criteria (ASC NEPM, 2013).

There was no first-time detection of the sum of PFHxS+PFOS or no new exceedances of the selected criteria reported at SW109 for the August 2023 sampling event.

The PFAS surface water analytical results from the August 2023 sampling events are presented in Appendix B – Table 2.

4.2 Groundwater results

4.2.1 Field observations and field measurements

Table 10 Groundwater observations and field measurements

Item	Observations and field measurements
Fieldwork dates	The groundwater sampling was completed on 30 to 31 October 2023.

Item	Observations and field measurements
Access and sample collection	All monitoring wells and bores were accessible and able to be sampled with the exception of the following: • MW422 was not sampled due to a construction site fence blocking access to the monitoring well. The SAQP (AECOM, 2023b) prescribed alternative well MW235, was gauged but not sampled due to the PVC casing being bent and not being able to deploy the HydraSleeve™. • MW112 was inaccessible due to site construction works. No contingency monitoring well is offered in the SAQP (AECOM, 2023b). • MW197 was dry. Contingency monitoring well MW236 was not sampled due to also being dry. • MW240 was dry. No contingency monitoring well is offered in the SAQP (AECOM, 2023b). • MW241 was dry. No contingency monitoring well is offered in the SAQP (AECOM, 2023b). • MW453 was dry. No contingency monitoring well is offered in the SAQP (AECOM, 2023b).
Monitoring well network condition	The monitoring well network was generally in good condition, with the following exceptions: • Contingency MW235 requires casing to be corrected or the well reinstalled. • MW112 is currently buried by earthworks being conducted in the area for Base construction works – if location cannot be rectified in future events, replacement location may be required.
Field observations	Monitoring wells MW133 and MW297 were observed to emit a strong hydrocarbon odour. Notably, MW297 had a 11 mm thickness of a light non-aqueous phase liquid (LNAPL) layer. MW133 had 26 mm of LNAPL.
Depth to groundwater and flow direction	A localised high point is in the centre of the Base, south of the runway, with the groundwater flow radiating from this location. Groundwater in the north and west portions of the Base is inferred to generally flow northwest towards the coast, with localised flow towards Ludmilla Creek on the western boundary of the Base and Rapid Creek north of the Base. Groundwater to the south of the Base is inferred to flow towards Charles Darwin National Park and Francis Bay. Groundwater contours are generally consistent with the Detailed Site Investigation (Coffey, 2018) flow direction. Depth to groundwater was recorded from 29 of 34 monitoring wells visited, ranging from 2.089 (MW190) to 12.991 (MW303) metres below top of casing (mbTOC). Groundwater elevations in the aquifer were between 2.51 (MW185) and 22.19 (MW115) metres Australian Height Datum (mAHD). Groundwater gauging data is presented in Appendix B – Table 3. Inferred groundwater contours and groundwater flow directions at the Base in October 2023 are shown in Figure 4 in Appendix A.
Water quality parameters	The water quality parameters are presented in Appendix B – Table 3 and are summarised below: • DO ranged from 0.84 mg/L (MW303) to 4.68 (MW115) indicating low to moderately oxygenated water. • EC ranged from 41.2 µS/cm (MW139) to 1794 µS/cm (MW209), indicating freshwater conditions. • pH ranged from 4.22 (MW180) to 5.65 (MW303) indicating acidic conditions. • Redox (corrected) ranged from 188.1 mV (MW303) to 398.1 mV (MW211) indicating reducing conditions. Groundwater parameters were measured for MW128, however the data was misplaced.

Item	Observations and field measurements
Estate management works or training activities	During the sampling event, no notable estate works, or training activities were observed in the vicinity of sampling locations with the exception of the following: • Suspected earthworks covering MW112 associated with recent taxiway upgrades.

4.2.2 PFAS groundwater analytical results

During the October 2023 event, all 28 groundwater samples reported concentrations of PFAS above the laboratory LOR with the exception of MW209 and MW451. All groundwater samples for Sum of PFHxS+PFOS were above the PFAS NEMP 2020 drink water criteria (HEPA, 2020). Seventeen groundwater samples for Sum of PFHxS+PFOS were above the PFAS NEMP 2020 recreational use criteria.

There was no first-time detection above the LOR for Sum of PFHxS+PFOS or PFOA, as well as no new exceedances of the selected criteria at any of the monitored locations.

The PFAS groundwater analytical results from the October 2023 sampling event are presented in Appendix B – Table 4**.**

4.3 Biota

4.3.1 Field observations

Table 11 Biota observations

Item	Observation
Field Observations	Sample descriptions were provided by NT Department of Fisheries field staff following the biota sampling event via an excel spreadsheet, noting species type, weight, and number of specimens. These are presented in Appendix B – Table 5 along with the analytical results.
Access and Sample Collection	All monitoring locations were accessible and able to be sampled. Fish and invertebrate species collected and analysed included: **Rapid Creek (BIO007):** • Mangrove Jack (Lutjanus argentimaculatus) • Forktail Catfish 1 (Neoarius sp.1) • Forktail Catfish 2 (Neoarius sp.2) • Banded Archerfish (Toxotes jaculatrix) • Milkfish (Chanos chanos) • Tarpon (Megalops cyprinoides) • Sea Mullet (Mugil cephalus) **Ludmilla Creek (BIOFA016):** • Giant Mangrove Whelk (Terebralia palustris) • Long Bum (Telescopium telescopium) **Ludmilla Creek (BIO018):** • King Salmon (Polydactylus macrochir) • Barramundi (Lates calcarifer) • Queenfish (Scomberoides commersonnianus) • Forktail Catfish 1 (Neoarius sp.1) • Sea Mullet (Mugil cephalus) • Northern Whiting (Sillago sihama) • Sand Crab (Portunus pelagicus) **Rapid Creek (BIO024):** • Redclaw Crayfish (Cherux quadricarinatus) **Rapid Creek (BIO026):** • Redclaw Crayfish (Cherux quadricarinatus)

Item	Observation
	• Cherabin (Macrobrachium spinipes) **Rapid Creek (BIO028):** • Redclaw Crayfish (Cherux quadricarinatus)

4.3.2 PFAS biota analytical results

Results from the October biota sampling event reported 38 of 48 primary samples above the LOR for PFAS, with 15 of 48 primary biota samples reported concentrations of PFAS that exceeded the Department of Health criteria for finfish or crustaceans (Department of Health, 2019). There was no first-time detection of Sum of PFHxS+PFOS within the location areas, nor were there any new exceedance of the selected criteria.

The PFAS biota analytical results are presented in Appendix B – Table 5.

5.0 Summary of current and next sampling events

5.1 Summary of monitoring event

The end of dry season event included surface water, groundwater and aquatic biota sampling between August and October 2023. The program included:

- one 'twice in dry season' surface water sample collected in August 2023
- 28 biannual groundwater samples collected in October 2023
- annual sampling of aquatic biota from six locations along Rapid and Ludmilla Creeks in October 2023.

The findings of the August 2023 surface water sampling event and the recommended actions are summarised in Table 12 below.

Table 12 Summary of surface water sampling events

Item	Comment	Recommended actions
Access to sampling locations	The proposed monitoring location was accessible.	No actions recommended.
Analytical Results	PFAS concentrations were recorded above the LOR for the one primary sample collected.	Ongoing monitoring in accordance with Base-wide PFAS OMP.
New exceedance of PFAS NEMP 2.0 (HEPA, 2020) drinking water guideline values in surface water	No locations reported first-time detections.	No actions recommended.
New exceedance of PFAS NEMP 2.0 (HEPA, 2020) recreational guideline values in surface water	No locations reported first-time detections.	No actions recommended.
First-time detection of PFAS in surface water	No locations reported first-time detections.	No actions recommended.
Sum of PFHxS of PFOS and/or sum of PFAS concentrations show an increasing trend in surface water	This will be evaluated in the OMR.	No actions recommended.
Sum of PFHxS of PFOS and/or sum of PFAS concentrations show a decreasing trend in surface water	This will be evaluated in the OMR.	No actions recommended.

The findings of the October 2023 groundwater sampling event are summarised in Table 13 below.

Table 13 Summary of October 2023 biannual groundwater sampling event

Item	Comment	Recommended actions
Access to sampling locations	All proposed monitoring locations were accessible with the exception of six monitoring wells: • Contingency well MW235 (contingency location for MW422) was gauged, however was unable to be	After completion of construction works in the vicinity of MW112, this well should be relocated and determine if still usable. Replacement may be required if the well remains buried and unlocatable.

Item	Comment	Recommended actions
	sampled due to PVC tubing being bent. • MW240, MW241, MW422, MW453 and MW197 were unable to be sampled due to them presenting as dry. • MW112 was unable to be sampled due to it being suspected to be buried beneath earthworks associated with the upgrade of the taxiway.	MW235 should be investigated for potential repair or decommissioning and replacement. No other actions recommended.
New exceedance of PFAS NEMP 2.0 (HEPA, 2020) drinking water guideline values in groundwater	No locations reported a new exceedance of the drinking water guideline values.	No actions recommended.
New exceedance of PFAS NEMP 2.0 (HEPA, 2020) recreational guideline values in groundwater	No locations reported a new exceedance of the recreational guideline values.	No actions recommended.
First-time detection of PFAS in groundwater	No locations reported first-time detections of Sum of PFHxS+PFOS.or PFOA.	No actions recommended.
Sum of PFHxS of PFOS and/or sum of PFAS concentrations show an increasing trend in groundwater.	This will be evaluated in the OMR.	No actions recommended.
Sum of PFHxS of PFOS and/or sum of PFAS concentrations show a decreasing trend in groundwater.	This will be evaluated in the OMR.	No actions recommended.

The findings of the annual biota sampling event in October 2023 are summarised in Table 14 below.

Table 14 Summary of annual biota sampling event in October 2023

Item	Comment	Recommended actions
Access to sampling locations	All proposed monitoring locations were accessible.	Continue monitoring in accordance with the SAQP.
Analytical results	PFAS concentrations were recorded above the LOR at 45 of 56 primary samples.	Continue monitoring in accordance with the SAQP.
New exceedance of adopted criteria for biota	No locations reported a new exceedance of adopted criteria for biota.	Continue monitoring in accordance with the SAQP.
First-time detection of PFAS in biota	No locations reported first-time detections of PFAS in biota.	Continue monitoring in accordance with the SAQP.

Item	Comment	Recommended actions
Sum of PFHxS and PFOS and/or sum of PFAS concentrations show an increasing trend in biota	This will be evaluated in the OMR.	Continue monitoring in accordance with the SAQP.
Sum of PFHxS and PFOS and/or sum of PFAS concentrations show a decreasing trend in biota	This will be evaluated in the OMR.	Continue monitoring in accordance with the SAQP.

5.2 Upcoming sampling events

Wet season surface water sampling will take place during the early part of the wet season, likely December 2023 to January 2024, then again during the late wet season in March to April 2024.

The next groundwater sampling event is scheduled for April 2024.

5.3 Upcoming Ongoing Monitoring Report

The next OMR Report is scheduled to be delivered in the second half of 2024.

Notes:
NM: not measured - data collection error
mg/L: milligram per Litre
µS/cm: microsiemens per centimetre
mV: millivolts
°C: degrees celcius
Corrected redox = redox + 200
^ TOC elevation not within DERP

Notes:
µg/L: micrograms per litre
LOR: limit of reporting
* LOR is above guideline value
Denotes first time detection above LOR for Sum of PFHxS+PFOS or PFOA
Denotes new exceedance of human health screening criteria

Project Name:	PFASOMP Defence	Project Number:	60612561	PM Name:	[redacted]	Bore ID:	
Client:		Project Location:	Darwin	Fieldwork Staff:		Sample Date:	30/8/23
						Well Development or Well Sampling Event? (circle)	

General Bore Information		Parameter Info.	Decontamination	Sampling Method	Hydrasleeve Info.	
Date of GW Level:	Bore Radius (mm):	Chem Kit Serial No.:	☐ Decontaminated	☐ Low Flow Pump rate:	Hydrasleeve Size:	Monitoring sequence followed (number in order):
Depth to GW (m-pvc):	Screen Interval (m):	Chem Kit Model:	☒ Dedicated	Intake depth:	Hydrasleeve Type:	
Bore Depth (m-pvc):	Casing Radius (mm):	Corrected Redox: Y / N	☐ Disposable	☐ Bailer ☐ Hydrasleeve	Sampling Depth (m-pvc):	Gauging
Depth to Product (m-pvc):	Cover Type (gatic/stick up):	(The correction to apply is probe dependent)	☐ Other (specify)	☐ Peristaltic Pump ☐ Waterra	Hydrasleeve Install time:	Hydrasleeve in
Product Thickness (m):	Bore Locked (YES/NO):	Parameter method: ☐ Downhole		☐ Other (specify)	Sampling Start Time:	Hydrasleeve out
	Key Type (if applicable):	☐ Retrieved				Parameters

Calculated bore volume (L):	Includes/ excludes bore annulus (circle)	# purge volumes removed:	Total purged volume (L):

Water Quality Parameters

Time	Cumulative Vol. Removed (L)	SWL (m-pvc)	Pump Rate	DO (ppm or mg/L)	E.C. (mS/cm or µS/cm)	pH	Redox (mV)	Temp °C	Odour, Colour, Turbidity
9:48	SWL09			0.64	100.6	6.01	57.5	25.8	Stagnant upstream & down stream & low flow, clear, colourless, no odour no sheen cloudy sheen on top
Acceptable Parameter Range:				± 10%	± 3%	± 0.05	± 10 mV	± 0.2 °C	± 10% turbidity (if using a turbidity meter)

Analytes Sampled for:		Bottles Collected			QA/QC Information	Field Comments
Field Filtered:	Unfiltered:	☐ x 40 mL Vial (HCl)	☐ x 60 mL Ferrous	☐ x 60 mL metals (HNO_3)	QC100 & QC200	Bore volume calculation, bore condition, fate of tubing, redox correction etc.
[redacted]	X	☐ x 40 mL Vial (H_2SO_4)	☐ x 100 mL Amber	☐ x 250 mL Plastic		
		15 x 20ml PFAS

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Project	: NT_1302_PFASOMP_23	Date Samples Received	: 02-Nov-2023 17:05
Order number	: 60612561	Date Analysis Commenced	: 03-Nov-2023
C-O-C number	: 59290	Issue Date	: 08-Nov-2023 12:12
Sampler	: [redacted]		
Site	: NT_1302_PFASOMP_23		
Quote number	: SY/139/19 V3		
No. of samples received	: 36		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
	0				
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	36	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	36	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

QA/QC Compliance Assessment to assist with Quality Review

Order number	: 60612561	No. of samples analysed	: 5

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	**5.00**	**10.00**	×	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	**5.00**	**5.00**	✓	NEPM 2013 B3 & ALS QC Standard
Method Blanks (MB)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	**5.00**	**5.00**	✓	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	20	**5.00**	**5.00**	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

REPORT OF ANALYSIS

PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

8:2 FTS (Surrogate Recovery)	%	108				NR70
8:2 diPAP (Surrogate Recovery)	%	90				NR70
Dates						
Date extracted		16-NOV-2023				
Date analysed		16-NOV-2023				

N23/023723
PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

REPORT OF ANALYSIS

Lab Reg No.		N23/023723				
Date Sampled		09-NOV-2023				
	Units					Method

[redacted]

Accredited for compliance with ISO/IEC 17025 - Testing.
This report shall not be reproduced except in full.
Results relate only to the sample(s) as received and tested.

This Report supersedes reports: *RN1411453*

Measurement Uncertainty is available upon request.

Note: Sampling date(s) have been provided by the client.
The testing was undertaken at: [redacted]

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order	: **ES2337477**

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Samples QC201, QC202, QC203 and QC204 have been forwarded to NMI.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **BIOTA**

Subject: FW: [EXTERNAL] - Re: ES2337465 & ES2337477

[redacted]

Can you please arrange to have analysis added as per Poppy's email below?
I'll bring the COC's down shortly!
Thanks!

Kind regards,

Subject: ES2337465 & ES2337477

Hi All,

We have received two batches worth of biota samples that are currently on hold.

Could you please send through an updated COC at your earliest convenience? We will keep these samples on hold until we receive further notice.

Cheers.

Kind regards,

[redacted]

Subject: FW: [EXTERNAL] - Re: ES2337465 & ES2337477

[redacted]

Can you please arrange to have analysis added as per Poppy's email below?
I'll bring the COC's down shortly!
Thanks!

Kind regards,

Subject: [EXTERNAL] - Re: ES2337465 & ES2337477

[redacted]

Could we please schedule all samples for PFAS and forward any QC samples frozen to NMI for analysis?

Thanks,

Subject: ES2337465 & ES2337477

Hi All,

We have received two batches worth of biota samples that are currently on hold.

Could you please send through an updated COC at your earliest convenience? We will keep these samples on hold until we receive further notice.

Cheers.

Kind regards,

[redacted]

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **BIOTA**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **BIOTA**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2337477**	Page	: 1 of 12
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	: +[redacted]
Project	: NT_1302_PFASOMP_23	Date Samples Received	: 31-Oct-2023
Site	: ----	Issue Date	: 01-Dec-2023
Sampler	: [redacted]	No. of samples received	: 59
Order number	: 60612561/3.1	No. of samples analysed	: 59

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **BIOTA**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2337477--021	1302_BIOAFA335_231018	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2337477--040	1302_BIOAFA354_231025	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231C: Perfluoroalkyl Sulfonamides	ES2337477--002	1302_BIOAFA316_231017	**N-Ethyl perfluorooctane sulfonamide (EtFOSA)**	4151-50-2	75.6 %	81.6-144%	**Recovery less than lower data quality objective**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	8	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	8	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **BIOTA**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method	***Sample Date***	*Extraction / Preparation*			*Analysis*		
Container / *Client Sample ID(s)*		***Date extracted***	*Due for extraction*	*Evaluation*	***Date analysed***	*Due for analysis*	*Evaluation*

Matrix: **BIOTA**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **BIOTA**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
PFOS - Linear/Branched Speciation	EP231-PFOS-SP	BIOTA	In-house: Linear PFOS is determined by quantiation of the separate linear peak using linear PFOS. Branched PFOS is determined as the difference between total PFOS (determined using a mixed linear/branched standard) and linear PFOS.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	BIOTA	In-house: A sample extract is analysed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of biota which is then solvent extracted. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Prep-Preparation for Biota Analysis	* Biota-PP	BIOTA	A sample is prepared from whole or particular tissues/organs, identified, homogenised and the total weight of prepared sample recorded.
Sample Preparation for PFAS in Biota	EP231-PR	BIOTA	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of homogenised biota which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Data Validation Reports

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60612561 - PFASOMP	**Date:**	14/11/2023
Site:	1302 – RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney & NMI	**Date:**	14/11/2023
Lab reference:	ES2337724, ES2338712, RN1410783 and RN1411490		

Key Findings:

The groundwater analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- Elevated RPDs should be taken into consideration when interpreting concentrations for PFOS close to guidelines.
- The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR for primary samples 1302_MW209_231031 and 1302_MW451_231031. This should be taken into consideration when interpreting data and using data quantitatively.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control (QAQC)		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times			✓	1	No
Frequency of laboratory QA/QC			✓	2	No
Limits of reporting (LOR)			✓	3	No
Blank analysis	Field blank	✓			No
	Rinsate blank	✓			No
	Trip blank	✓			No
	Method blank	✓			No
Field intra-laboratory relative percent differences (RPDs)					No
Field inter-laboratory RPDs			✓	4	No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries			✓	5	No
Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other observations		✓		NA	

Comments	
1. Sample handling/preservation/holding times	Sample receipt temperature (26.8 °C) was outside of the recommended range (≤6 °C) in primary batch ES2337724. The inter-laboratory sample was received at the secondary laboratory at a lower temperature (11.8 °C). Potential under reporting must be taken into consideration. However, due to the nature of PFAS not being volatile, that all samples were received below ambient groundwater temperature at the time of sampling (~30 °C), the samples were immediately cooled upon collection, and lastly that the primary and inter-laboratory RPDs were collected at the required frequency and generally within control limits, the potential for under reporting is not considered to materially affect the interpretation of results. Sample receipt temperature (31.2 °C) was outside of the recommended range (≤6 °C) in primary batch ES2338712. The inter-laboratory sample was received at the secondary laboratory at a chilled temperature. Potential under reporting must be taken into consideration. However, due to the nature of PFAS not being volatile, that all samples were received slightly above ambient groundwater temperature at the time of sampling (~30 °C), the samples were immediately cooled upon collection, and lastly that the primary and inter-laboratory RPDs were collected at the required frequency and generally within control limits, the potential for under reporting is not considered to materially affect the interpretation of results.
2. Frequency of laboratory QA/QC	Laboratory duplicate samples were not reported for Per- and Polyfluoroalkyl Substances (PFAS) in the primary lab batches ES2338712 and ES2337724. The precision of the data can be assessed as acceptable based on intra- and inter-laboratory duplicate RPDs which were reported at the required frequencies and generally within control limits. Matrix spikes were not reported at the required frequencies for Per- and Polyfluoroalkyl Substances (PFAS) in the primary batch ES2337724. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits), and available matrix spike recoveries for the same analytical method group (which were reported within control limits).
3. Limits of reporting	Limits of reporting were sufficiently low to enable assessment against adopted guideline criteria (NEMP 2020 guidelines), with the exception of PFOS against the freshwater species protection guideline value (99%). The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR for primary samples 1302_MW209_231031 and 1302_MW451_231031. This should be taken into consideration when interpreting data and using data quantitatively.

4.	Field inter-laboratory RPDs	Field intra-laboratory duplicate RPDs were reported within control limits, with the exception of the following (high concentrations in **bold**): • **1302_MW144_231030** & 1302_QC200_231030 for Perfluorooctane sulfonic acid (PFOS) (58%) • **1302_MW185_231031** & 1302_QC202_231031 for Perfluorooctane sulfonic acid (PFOS) (77%) This apparent lack of precision should be taken into consideration when interpreting concentrations for PFOS close to guidelines as primary results of PFOS may be biased low by up to 77%.
5.	Matrix Spikes	Matrix spike recoveries (where reported) were within control limits for ES2338714, except for PFHxS and PFOS as background levels were greater than or equal to 4x spike levels. These non-determinations do not reflect method bias and do not affect data interpretation. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits), and available matrix spike recoveries for the same analytical method group (which were reported within control limits).

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60612561	**Date:**	12/09/2023
Site:	1302 – RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney; NMI Sydney	**Date:**	12/09/2023
Lab reference:	August 2023: ES2329252, RN1404541		

Key Findings:

The analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- Elevated RPDs should be taken into consideration when using data for PFOS quantitatively.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times			✓	1	No
Frequency of laboratory QA/QC		✓			No

Field inter-laboratory RPDs			✓	2	No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries		✓			No
Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other comments		✓			No

Comments

1. Sample handling/ preservation/ holding times

Laboratory batches were received outside of the recommended temperature range (≤6°C):

Batch Number	Temperature (°C)
ES2326252	26.0 °C
RN1404541	Chilled

Potential under reporting must be taken into consideration. However, the potential for under reporting is not considered to materially affect the interpretation of results due to the nature of PFAS not degrading via volatilisation, the samples were received at ambient surface water temperature at the time of sampling (25.8 °C) and the samples were immediately cooled upon collection.

DATA VALIDATION REPORT; WATER

Laboratory:	ALS Sydney; NMI Sydney	**Date:**	12/09/2023
Lab reference:	August 2023: ES2329252, RN1404541		

2. Field inter-laboratory RPDs	Field inter-laboratory RPDs were reported within control limits, except for PFOS (as shown in the RPD table), greater concentrations are shown in bold: • **1302_SW109_230830** & 1302_QC200_230830 for PFOS (70%) As all concentrations of PFOS were reported well above the adopted guidelines (0.00023 µg/L), the elevated RPD is not considered to affect the interpretation of results against guidelines. However, the elevated RPD should be taken into consideration when using the data quantitatively.

Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other comments					No

Comments

1. Frequency of field quality assurance/quality control	A field blank sample was missed during the sample processing day. The precision of the data can be assessed as acceptable based on the available intra-laboratory duplicate RPDs which were reported at the required frequencies and within control limits.
2. Number of tests requested/reported	Inter-laboratory duplicate samples were collected and sent to NMI. There was an internal lab miscommunication and did not schedule the samples for analysis. The new scheduled reporting date is the 6 January 2024. AECOM will process these results upon receival and include in Revision 0 of report.
3. Sample handling/preservation	Sample receipt temperature (8.9°C) was slightly outside of the recommended range (≤6°C) in primary batch ES2337477. The inter-laboratory samples were received at the secondary laboratory frozen. Potential under reporting must be taken into consideration. However, as the inter-laboratory duplicate samples were received frozen, the primary samples being immediately cooled upon collection, and the primary RPDs being within control limits, the potential for under reporting is not considered to materially affect the interpretation of results.

DATA VALIDATION REPORT; Biota

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60612561	**Date:**	08/12/2023
Site:	RAAF Base Darwin		
Matrix:	Biota	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney	**Date:**	18/12/2023
Lab reference:	ES2337477		

4. Frequency of Laboratory QA/QC	Laboratory duplicate samples were not reported for Per- and Polyfluoroalkyl substances (PFAS) method group in primary batch ES2337477. The precision of the data can be assessed as acceptable based on intra-laboratory duplicate RPDs which were reported at the required frequencies and within control limits. Matrix spikes were not reported at the required frequencies for PFAS method groups. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits).
5. MS % recoveries	Matrix spikes were not determined for Perfluorooctane sulfonic acid (PFOS) as background levels were greater than or equal to 4 x the spike levels. These non-determinations do not reflect method bias and do not affect data interpretation. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits).

Analyte	Recovery (%)	Range (%)	Comments
N-Ethyl perfluorooctane sulfonamide (EtFOSA)	75.6	81.6 - 144	Recovery less than lower data quality objective

As there is no adopted guideline value for EtFOSA, the potential for under reporting is not expected to affect interpretation of the results against guidelines. However, this potential for under reporting should be taken into consideration when using the data quantitatively.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) outlined in the *PFAS Management Area Plan (PMAP)* (Department of Defence, 2018) at Royal Australian Air Force (RAAF) Base Darwin (the 'Base') in the Northern Territory (NT). The locations of the Base and Management Area are shown on **Figure 1** in **Appendix A**. The OMP (Department of Defence, 2023) for the Base outlines the requirement to complete groundwater and surface water sampling biannually.

The primary purpose of the OMP (Department of Defence, 2023) is to monitor changes to the PFAS impact in groundwater, surface water and biota associated with sources of PFAS as initially assessed through the detailed site investigation phase of works. Changes may result from the specific or cumulative impact of remediation or containment actions, existing transportation trends, and changes to hydrogeology or weather events.

The monitoring plan at RAAF Base Darwin includes a regime of groundwater and surface water sampling to capture these changes in the long term, to enable Defence to maintain an up-to-date understanding of temporal and spatial distribution, concentration, and transport of PFAS contaminants.

This report details the scope and findings of 2023-2024 wet season monitoring activities, which were completed between October 2023 and April 2024.

1.2 Objectives

As noted above, the objective of the *PFAS OMP* (Department of Defence, 2023) is to provide information on changes to PFAS contamination originating from Defence property to inform risk management decisions by Defence to protect human health and the environment.

The purpose of this PFAS OMP factual report is to summarise the scope of works and findings from sampling works conducted between October 2023 and April 2024 in accordance with Revision 3 SAQP (AECOM, 2023). These works included:

- Annual biota sampling in October 2023
- Twice in wet season surface water sampling in December 2023 and March 2024
- PFAS mass-flux surface water measurements and sampling monthly during the wet season, December 2023 to April 2024
- Biannual groundwater sampling in March 2024

This report has been prepared in accordance with the *Defence PFAS OMP Factual Reports Guidance,* Version 0.2, May 2021 (Department of Defence, 2021a). An ongoing monitoring report (OMR) will be subsequently developed for the purpose of assessing the data collected during the discrete monitoring events completed over the preceding 12-month period (May 2023 through April 2024) and will include assessment of environmental variability and any statistically significant trends in PFAS concentrations.

2.0 Scope of work

The sampling event was completed in general accordance with the SAQP (AECOM, 2023). Prior to commencement of the sampling events, the SAQP (AECOM, 2023), was reviewed to ensure compliance with the following:

- Heads of the Environment Protection Authority (HEPA), PFAS National Environmental Management Plan (NEMP 2.0) (HEPA, 2020)
- National Environment Protection (Assessment of Site Contamination) Measure 1999 (ASC NEPM, 1999)
- The OMP (Department of Defence, 2023)
- Defence Routine Environment Water Quality Monitoring Manual (Department of Defence, 2019)
- AS/NZS 5667:1998 Water quality – Sampling (AS/NZS, 1998)
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018)

In summary, the scope of works completed for the wet season sampling included:

- October 2023:
  - Annual aquatic biota samples (fish and aquatic invertebrate) were collected in October 2023 from six locations using a combination of netting, trapping and hand collection (refer to **Table 1** and **Figure 2** in **Appendix A** for specific locations).
- December 2023:
  - Collection of 24 ‘twice in wet season’ surface water samples from 24 of 24 planned sampling locations (refer to Table 3 and **Figure 2, Appendix A** for specific locations).
  - Monthly in wet season collection of surface water samples was completed from four locations for the Base-wide PFAS mass flux investigation (refer to **Table 4** and **Figure 2** in **Appendix A** for specific locations).
- January 2024:
  - Monthly in wet season collection of surface water samples was completed from four locations for the Base-wide PFAS mass flux investigation (refer to **Table 4** and **Figure 2** in **Appendix A** for specific locations).
- February 2024:
  - Monthly in wet season collection of surface water samples was completed from four locations for the Base-wide PFAS mass flux investigation (refer to **Table 4** and **Figure 2** in **Appendix A** for specific locations).
- March 2024:
  - Collection of groundwater samples (including gauging of groundwater levels) from 33 of 34 existing monitoring wells (or designated alternatives) using Hydrasleeves™ (refer to **Table 2** and **Figure 3** in **Appendix A** for specific locations).
  - Collection of ‘twice in wet season’ surface water samples from 23 of 24 planned sampling locations (refer to **Table 3** and **Figure 2** for specific locations).
  - Monthly in wet season collection of surface water samples was completed from four locations for the Base-wide PFAS mass flux investigation (refer to **Table 4** and **Figure 2** in **Appendix A** for specific locations).
- April 2024:

- Monthly in wet season collection of surface water samples was completed from two of the four sampling locations for the Base-wide PFAS mass flux investigation (refer to **Table 4** and **Figure 2** in **Appendix A** for specific locations).

- Collection of intra- and inter-laboratory duplicate samples at a rate of 1 in 10 primary samples, one rinsate, one field blank sample per sampling day and one trip blank per cooler per event. Deviations from the collection of quality control (QC) samples are described in Section 2.2.
- Analysis of biota, surface water and groundwater samples for a suite of 28 PFAS analytes at the standard limit of reporting (LOR).
- Data management of the OMP field and laboratory data in the Defence ESdat database.
- Preparation of this Sampling Event Factual Report.

2.1 Planned monitoring locations

The monitoring locations outlined within the relevant SAQP **(AECOM, 2023)** for the biota sampling, groundwater sampling and surface water sampling events are tabulated below. Deviations from the planned sampling are highlighted in bold and detailed in Section 2.2 below.

Table 1 Annual biota sampling locations (collected in October 2023)

Area	Description	Sampling locations	Indicator/target capture	No. of locations	Total
Off-Base (biota)	Rapid Creek Freshwater – Upstream of Trower Road	BIOFA024, BIOFA026, BIOFA028	Crustaceans	3	6 locations
	Ludmilla Creek – Estuarine area	BIOFA016	Molluscs	1	
	Rapid Creek mouth – Casuarina Drive	BIOFA007	Diadromous or estuarine fish	1	
	Ludmilla Creek – Boat Ramp	BIOFA018	Diadromous or estuarine fish	1	

* The biota sampling locations in **Figure 2 (Appendix A)** are approximate, as exact locations vary depending on habitat available on the day of sampling.

Table 2 Biannual groundwater sampling locations sampled in March 2024 SAQP (AECOM, 2023)

Area	Description	Sampling locations	Number of wells/bores	Total
On-Base	Former fuel farm 1	MW215	1	22 locations
	Former fuel farm 5	MW297, **MW112***	2	
	Former fuel farms	MW303, MW133, MW205	3	
	Former fire training area 1	**MW422***, MW139, MW454	3	
	Current fire training area	MW240, MW241, MW453	3	
	RAAF fire station	MW103	1	
	Former Aviation Rescue Fire Fighting (ARFF) fire station	MW115	1	
	Source area downgradient transect	MW107, MW128	2	

Area	Description	Sampling locations	Number of wells/bores	Total
	Southern boundary of Base	MW141, MW144	2	
	Western boundary of Base	MW148, MW451, MW452	3	
	Rapid Creek – eastern end	MW156	1	
Off- Base	Former fire training area 2, Darwin International Airport (DIA)	MW197	1	12 locations
	Off-Base(north)	MW185	1	
	Rapid Creek	MW190, MW191, MW194, MW195	4	
	Off-Base (south)	MW176, MW180, MW200, MW209	4	
	Off-Base(southwest)	MW211	1	
	Off-Base (west)	MW210	1	

* Monitoring well MW112 is suspected to have been destroyed during upgrades to the taxiway. Monitoring well MW422 was decommissioned during the PFAS post remediation works and was replaced with MW502 and was sampled in lieu.

The monitoring locations outlined within the SAQP (AECOM, 2023) for the surface water sampling events are outlined in **Table 3** and **Table 4.**

Table 3 Twice in wet season surface water sampling locations in December 2023 and March 2024 SAQP (AECOM, 2023)

Area	Description	Sampling location code	Sampling frequency	Number of locations
On-Base	Surface water flow – current fire training ground	**SW156***	Twice yearly (Start-Wet season, end-Wet season) SW170 and SW312 are also sampled monthly through the Wet season (Dec – Apr)	**On-Base (8 locations)**
	Stormwater pipe - Airside operations	SW160		
	Stormwater– southern boundary	SW162		
	Surface water drain - near Former Fuel Farm 5	SW178		
	Surface water drain - north of Former Fuel Farms 4 & 6	SW181		
	Rapid Creek	SW152		
	Surface water drain - Eastern end of runway	SW170^		
	Drainage from FFTA1	SW312^		
Off-Base	Rapid Creek	SW104, SW106, SW108, SW112, SW113		**Off-Base (16 locations)**
	DIA drain to Rapid Creek	SW114, SW115, SW168		

Area	Description	Sampling location code	Sampling frequency	Number of locations
	Ludmilla Creek	SW120, SW124, SW125		
	Reichardt Creek	SW132, SW133		
	Drain to Sadgroves Creek	SW143		
	Osgood Drive	SW300^	Monthly sampling through Wet season (Dec – Apr)	
	Rapid Creek	SW109^	Monthly sampling through Wet season (Dec – Apr)	

*SW156 was unable to be sampled in March due to it being dry.

^ Surface water locations also being PFAS mass-flux monthly in wet season sample locations.

Table 4 Base- wide PFAS mass-flux monthly in wet season surface water locations completed between December 2023 and April 2023 SAQP (AECOM, 2023)

Area	Description	Sampling locations	Number of wells/bores	Total
On-Base	Surface water drain – Eastern end of runway	SW170	1	2 Locations
	Drainage from FFTA1	SW312	1	
Off-Base	Rapid Creek	SW109	1	2 Locations
	Osgood Road	SW300	1	

*SW300 and SW312 were unable to be sampled in April due to them being dry.

2.2 Deviations from the SAQP

The works completed during this sampling event included deviations from the SAQP (AECOM, 2023) as outlined below in **Table 5** below.

Table 5 Deviation from the SAQP (AECOM, 2023) during the monthly wet season PFAS Mass-Flux surface water sampling event

SAQP	Monthly in wet PFAS Mass-Flux surface water sampling	Impact on Program
Three of four surface water locations identified to be sampled have flow readings documented, as well as the total depth and depth to water recorded. SW109 has flow measurements recorded by a nearby stream gauge.	During the December PFAS Mass-Flux surface water sampling event, samples were collected at all four locations. However, flow readings, depth to water and total depth were not recorded.	While concentration data will be useful for understanding PFAS impacts at the time of sample collection, the lack of flow and calculated volume data will prevent this event from being used for PFAS mass flux calculations.
Four surface water locations are identified to be sampled as part of the monthly in wet season for the Base-	During the April 2024 PFAS Mass-Flux surface water sampling event, samples were collected from 2 of 4 locations. The following was not collected: • SW312 and SW300 as they were dry.	No impact – Only a cumulated 18.4 mm of rain was recorded at Darwin International Airport in April 2024. As PFAS mass flux only

SAQP	Monthly in wet PFAS Mass-Flux surface water sampling	Impact on Program
wide PFAS mass flux investigation.		occurs during active flow events PFAS mass flux calculations would not be impacted by resulting data set as it is demonstrated as having zero flux.
Geochemical parameters are to be recorded for surface water samples.	During the April 2024 PFAS Mass-Flux surface water sampling event, dissolved oxygen readings at SW170 were unable to be recorded due to water quality meter failure.	Minimal impact – dissolved oxygen readings from other locations are generally consistent with expected Base conditions.

Table 6 Deviation from the SAQP (AECOM, 2023) during the biannual groundwater sampling event in March 2024

SAQP	March sampling event	Impact on Program
34 groundwater locations are identified to be sampled as part of the sampling event.	During the biannual groundwater sampling event, samples were collected from 33 of 34 locations. The following was not collected: • MW112 is suspected to have been destroyed during the taxiway upgrades in 2023.	Minimal impact – loss of data. However, other groundwater samples were collected from down-gradient locations which monitor PFAS mobilisation and transport, reducing the impact of the data gap.
34 groundwater locations are identified to be sampled as part of the sampling event.	Groundwater monitoring well MW422 was decommissioned before the sampling event and replaced with newly installed monitoring well MW502. AECOM was informed by the Lead Consultant that MW502 has replaced MW422 and was considered suitable for use in PFAS OMP reporting.	No impact – MW502 is a replacement well for monitoring well MW422.
One rinsate (QC300) per sampling day.	During the biannual groundwater sampling event, only one rinsate blank was collected instead of two.	Minimal impact – The decontamination method of the sampling pole is assessed as acceptable and the potential for cross contamination via sampling methods is considered unlikely based on the following: • Concentrations of all analytes were reported below the LOR in the rinsate sample analysed. • All sampling equipment was either dedicated, disposable or decontaminated with a solution of water and Liquinox

SAQP	March sampling event	Impact on Program
		between sampling locations. • The decontamination methods and field staff were consistent over the course of the sampling event. • All reported groundwater sampling results were within expected concentration ranges.
One field blank (QC400) per sampling day.	During the biannual groundwater sampling event, only one field blank was collected instead of two.	Minimal impact - As the rinsate blank reported below LOR and thus, the lower than nominated frequency of field blanks is not material.

Table 7 Deviation from the SAQP (AECOM, 2023) during the twice in wet surface water sampling in December 2023 and March 2024

SAQP	Twice in wet surface water sampling	Impact on Program
Collection of field parameters at the surface water locations.	Field parameters failed to save on ALS Compass during the surface water sampling event in December 2023 for the following locations: - SW112 - SW113 - SW120 - SW109	Minor impact – data gap. Field parameters and observations were accurately saved during the March 2024 sampling event for the missing data locations during the December 2023 sampling event.
24 surface water sampling locations are to be collected twice in wet season.	Surface water location SW156 was dry and unable to be sampled in March 2024.	Minor impact – data gap. While specific PFAS concentration data was not collected from SW156 during the late wet season sampling event, downgradient sample location SW109 recorded PFAS concentrations within the expected range indicating it is unlikely that up-gradient locations such as SW156 would be contributing higher than expected PFAS concentrations to the localised drainage system.

3.0 Sampling methodology

The methodology adopted for the sampling events between October 2023 and April 2024 (where applicable) was in accordance with the SAQP (AECOM, 2023) and is summarised **Table 8** below.

Table 8 Sampling methodology

Item	Details
Aquatic biota sampling	
Aquatic biota target samples	Target species for each identified sample location were based on those that are recognised as consumed by the public from the following three groups: • Diadromous or estuarine fish (Barramundi, Flathead, Javelin, Sweetlips, Mullet, Rock Cod, Queenfish, Jewfish, etc.) • Molluscs (Longbums [Telescopium] and Whelk) • Crustaceans (Redclaw Crayfish [C. quadricarinatus.])
Aquatic biota sampling methodology	Sampling was conducted by Eco Logical Australia Pty Ltd and the Northern Territory (NT) Department of Fisheries between 17 and 25 October 2023. Ethics approvals and Fisheries/Parks & Wildlife licenses were obtained prior to biota sample collection. Estuarine fish were collected using 4-6-inch gill nets set three hours before low tide. Nets were continuously monitored from a small boat and cleared when movement was detected. Any non-target species were released immediately and where targeted biota species were identified, they were measured, weighed and euthanised humanely in accordance with the animal ethics permits conditions. Redclaw were captured using Opera House traps baited with raw beef (purchased from a supermarket). Traps were set overnight in freshwater pools and collected in the early morning. Longbums were hand-collected during low tide from the mangroves. Redclaw and Longbums were rinsed prior to being stored in snap-lock bags, euthanised by freezing and preserved frozen until preparation at NT Fisheries wet room laboratories. Samples were prepared for analysis at the Department of Fisheries laboratory prior to dispatching to the primary laboratory. This included the removal of scales/shell, head, and internal organs. Fillets were taken with skin intact and homogenised prior to sub-sampling and analysis. Samples were prepared based on the following procedure: • For Target fish: - Used opened bag as board cover. - Cleaned knife/blade with deionised water. - For large fish the complete tissue samples of edible flesh was collected. - For smaller fish, samples were provided whole with entrails removed. • For Redclaw Crayfish: - Rinsed in deionised water. - Composited whole as 50-100g samples (about 3-5 individuals per sample). • For Longbum: - Shells placed inside a sample bag and carefully smashed with a hammer, then tissue extracted with forceps. - Tissue rinsed with deionised water. - Composited 10 individuals as a sample. The weight, length, species, and location caught were recorded.
QA/QC samples	Field QA/QC samples collected included rinsate and split samples (intra-laboratory duplicates) which are described as the following: • Rinsate samples were taken from decontaminated sample processing equipment (Filleting knife).

Item	Details
	• Split samples were taken from fin fish to ensure homogeneity for intra-laboratory analysis rather than composite samples of crustaceans. Refer to **Appendix D** for data validation report of the results.
Sample analysis	In accordance with the Data Quality Objectives (DQO) outlined in the OMP SAQP (AECOM, 2023), samples collected were tested for the extended PFAS suite at National Association of Testing Authorities' (NATA) accredited laboratories. Primary and intra-laboratory duplicate samples were submitted to the primary laboratory, Australian Laboratory Services Environmental (ALS) Sydney, New South Wales (NSW). Inter-laboratory samples are sent to secondary laboratory, National Measurement Institute (NMI) Sydney, NSW. Chain of custody (COC) forms and laboratory certificates are presented in **Appendix E** and **Appendix F.**
Groundwater sampling	
Groundwater gauging	Groundwater gauging was conducted prior to collection of groundwater samples using an oil/water interface probe. Measurements included depth to light non-aqueous phase liquid (LNAPL) (if any), depth to water and total depth (if no product).
Field parameters	Where appropriate, field parameters were recorded ex-situ using a calibrated YSI Pro water quality meter (refer to **Appendix C** for calibration certificate). Parameters recorded consisted of the following: temperature (°C), electrical conductivity (EC), dissolved oxygen (DO), reduction- oxidation (redox) potential (ORP) and pH. Observations of odour, colour, and clarity (turbidity) of groundwater was recorded at each site.
Sampling methodology	Groundwater samples were collected from all accessible wells using the no-purge HydraSleeves™ method installed one-metre below the standing water level of each well for a minimum of 24 hours prior to the sampling. This was based on a review of the well construction log.
QA/QC samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate, field blank and trip blank samples. Refer to **Appendix D** for data validation report of the results.
Sample analysis	In accordance with the Data Quality Objectives (DQO) outlined in the OMP (AECOM, 2023), samples collected were tested for the extended PFAS suite at National Association of Testing Authorities' (NATA) accredited laboratories. Primary and intra- laboratory duplicate samples were submitted to the primary laboratory, Australian Laboratory Services Environmental (ALS) Sydney, New South Wales (NSW). Inter-laboratory samples are sent to secondary laboratory, National Measurement Institute (NMI) Sydney, NSW. COC forms and laboratory certificates are presented in **Appendix E** and **Appendix F.**
Surface water sampling	
Sampling methodology	Surface water samples were collected from approximately 0.5 metres below the water surface or mid-column from shallow water locations to minimise collection of sediment or floating materials in the samples. At each location, a new, laboratory supplied container was lowered into the water, using an aluminium sampling pole, with the cap immediately applied once the container was full.
Field parameters	Where appropriate, field parameters were recorded ex-situ using a calibrated YSI Pro water quality meter (refer to **Appendix G** for calibration certificate). Parameters recorded consisted of the following: temperature, EC, DO, ORP and pH. Observations of odour, colour, and clarity (turbidity) and general flow observations were recorded at each site.
QA/QC samples	Field QA/QC samples collected included intra-laboratory duplicate and inter-laboratory duplicate samples, rinsate, field blank and trip blank samples.

Item	Details
	Refer to **Appendix D** for data validation report of the results.
Sample analysis	In accordance with the Data Quality Objectives (DQO) outlined in the OMP (AECOM, 2023), samples collected were tested for the extended PFAS suite at National Association of Testing Authorities' (NATA) accredited laboratories. Primary and intra-laboratory duplicate samples were submitted to the primary laboratory, Australian Laboratory Services Environmental (ALS) Sydney, New South Wales (NSW). Inter-laboratory samples are sent to secondary laboratory, National Measurement Institute (NMI) Sydney, NSW. COC forms and laboratory certificates are presented in **Appendix E** and **Appendix F.**

3.1 Adopted screening criteria

Screening criteria were selected on the basis of national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- Department of Health, 2019. Health based guidance values for PFAS for use in site investigations in Australia. April 2017 (as amended 2019) (Department of Health, 2019).
- Heads of the Environment Protection Authority (HEPA), PFAS National Environmental Management Plan (NEMP 2.0) (HEPA, 2020).
- National Environment Protection (Assessment of Site Contamination) Measure, 1999 (ASC NEPM).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water (NHMRC, 2019).

The screening criteria which have been adopted for aquatic biota are presented below in **Table 9.**

Table 9 Summary of adopted screening criteria for consumption of aquatic biota

Pathway	Compound	Criteria	Comment/reference
Human health receptors			
Crustaceans	Perfluorooctane sulfonate (PFOS) and PFOS + perfluorohexane sulfonate (PFHxS)	65 µg/kg	Department of Health (2019) *Derivation: Children 2-6 years, median consumption* Occasionally consumed food. Trigger criteria for investigation for crustaceans apply to molluscs due to the small number of consumers of molluscs.
	Perfluorooctanoic acid (PFOA)	520 µg/kg	
Finfish	PFOS and PFOS + PFHxS	5.2 µg/kg	Department of Health (2019). *Derivation: Children 2-6 years, P90 consumption*
	PFOA	41 µg/kg	

The screening criteria which have been adopted for groundwater and surface water are presented in **Table 10.**

Table 10 Summary of adopted screening criteria for groundwater and surface water

Pathway	Compound	Criteria	Comment/Reference
Human health receptors			
Drinking water - groundwater	PFOS + PFHxS	0.07 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). *All groundwater results will be compared to these criteria.*
	PFOA	0.56 µg/L	
Recreational use – surface water	PFOS + PFHxS	2 µg/L	The values presented in the PFAS NEMP 2.0 (HEPA, 2020) are from the Guidance on Per and Polyfluoroalkyl (PFAS) in Recreational Water (NHMRC, 2019) guidance on the assessment of PFAS in recreational water released in August 2019. *All surface water results will be compared to these criteria.*
	PFOA	10 µg/L	
Ecological receptors			
Freshwater (99% species protection values) – groundwater and surface water	PFOS	0.00023 µg/L	These values are from the PFAS NEMP 2.0 (HEPA, 2020). The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value. *All groundwater and surface water results will be compared to these criteria.*
	PFOA	19 µg/L	

3.2 Data quality objectives and data validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2023).

Data validation assessment is provided in **Appendix D.**

Key findings from the data validation were as follows:

- Data validation procedures employed in the assessment of the field and laboratory QA/QC data are indicative that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report. The data validation findings did not flag potential material inaccuracies with any analytical results.
- The potential exists for concentrations of PFOS to be above the adopted *PFAS Freshwater 99% Species Protection guideline* (0.00023 µg/L) (HEPA, 2020), but below the laboratory LOR (0.01 µg/L) for the following surface water samples:
  - 1302_SW114_231213
  - 1302_SW115_231213
  - 1302_SW124_231206
  - 1302_SW178_231213
  - 1302_SW300_240124
  - 1302_SW115_240306

- 1302_QC200_240306

March 2024:

- Elevated relative percentage differences (RPDs) should be taken into consideration when interpreting concentrations for PFOS close to guidelines in all groundwater samples excluding 1302_MW209_240305.

April 2024:

- Elevated RPDs for the surface water samples should be taken into consideration when interpreting concentrations for PFOS close to guidelines.

4.0 Field observations and results

4.1 General field observations

The following field observations were applicable across the Base during the sampling events and is provided in **Table 11.**

Table 11 General field observations

Item	Observation
Weather conditions – Biota sampling event	Weather during the 17-25 October 2023 biota sampling event was observed to be hot and humid. No rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates (Bureau of Meteorology, 2023).
Weather conditions - surface water sampling events	Weather conditions between the 6th and 14th of December 2023 for the PFAS mass flux and start of wet season surface water sampling event was characterised by moderate to high temperature, moderately humid and experienced rainfall. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 4.6 mm of rain being recorded (Bureau of Meteorology, 2023). Weather conditions during the 24 January 2024 mass flux surface water event was characterised as having moderate to high temperature, high humidity and experiencing rainfall. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 28.2 mm of rain being recorded (Bureau of Meteorology, 2023). Weather conditions during the 15 February 2024 mass flux surface water event was characterised as having moderate to high temperature, moderate humidity and experiencing rainfall. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 4.8 mm of rain being recorded (Bureau of Meteorology, 2023). Weather conditions during the 6 March 2024 end of wet season and mass flux surface water sampling event was characterised as having high temperatures, moderate humidity and experiencing rainfall. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 4.8 mm of rain being recorded (Bureau of Meteorology, 2023). Weather conditions during the 30 April 2024 mass flux surface water event was characterised as having moderate to high temperatures, moderate humidity and experiencing rainfall. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 0.2 mm of rain being recorded (Bureau of Meteorology, 2023).
Weather conditions - groundwater sampling events	Weather conditions during the 4th and 5th of March 2024 groundwater event was characterised as hot, humid and dry. Rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates with 0.4 mm of rain being recorded (Bureau of Meteorology, 2023). Weather conditions during the 19th and 20th of March 2024 groundwater event was characterised as hot, humid and dry. 0.3 mm of rainfall was recorded at the nearest rain gauging station (Darwin Airport) on the sampling field dates (Bureau of Meteorology, 2023).
Estate Management Works or Training Activities	During the sampling event, no notable estate works, or training activities were observed in the vicinity of sampling locations with the exception of the following: • Earth moving activities occurring air side of the RAAF Base.

4.2 Biota

4.2.1 Field observations and field measurements

Table 12 Biota observations

Item	Observation
Field Observations	Sample descriptions were provided by NT Fisheries field staff following the biota sampling event via an excel spreadsheet, noting species type, weight, and number of specimens. These are presented in **Appendix B.**
Access and Sample Collection	All monitoring locations were accessible and able to be sampled. Fish and invertebrate species collected and analysed included: **Ludmilla Creek (BIOFA018):** King Salmon *(Polydactylus macrochir)* Barramundi (Lates calcarifer) Queenfish (Scomberoides commersonnianus) Forktail Catfish 1 (Neoarius sp.1) Sea Mullet (Mugil cephalus) Northern Whiting (Sillago sihama) Sand Crab (Portunus pelagicus) **Rapid Creek (BIOFA007):** Mangrove Jack (Lutjanus argentimaculatus) Forktail Catfish 1 (Neoarius sp.1) Forktail Catfish 2 (Neoarius sp.2) Banded Archerfish (Toxotes jaculatrix) Milkfish (Chanos chanos) Tarpon (Megalops cyprinoides) Sea Mullet (Mugil cephalus) **Ludmilla Creek (BIOFA016):** Giant Mangrove Whelk (Terebralia palustris) Long Bum (Telescopium telescopium) **Rapid Creek (BIOFA024and BIOFA028):** Redclaw Crayfish (Cherux quadricarinatus) **Rapid Creek (BIOFA026):** Redclaw Crayfish (Cherux quadricarinatus) Cherabin (Macrobrachium spinipes)

4.2.2 PFAS biota analytical results

Results from the October 2023 biota sampling event reported 38 of 48 primary samples above the LOR for PFAS. Sampling area BIOFA007 had nine of 17 samples that exceeded the adopted screening criteria for finfish for PFOS concentrations. Sampling area BIOFA018 had one of 16 samples that exceeded the adopted screening criteria for finfish for PFOS concentrations. The PFAS biota analytical results are presented in **Appendix B**.

4.3 Surface water

4.3.1 Field observations and field measurements

Field data was collected on data forms and the data was uploaded into ESdat for development of report tables. Field data tables are presented in **Appendix B Table 2.**

Table 13 Surface water observations and field measurements

Compound	Criteria
Fieldwork Dates	The surface water samples, and field parameters for all wet season surface water events were collected on the following dates: • 6-14 December 2023 – Start of wet season and mass flux surface water • 24 January 2024 – Mass flux surface water • 15 February 2024 – Mass flux surface water • 6 March 2024 – End of wet season and mass flux surface water • 30 April 2024 – Mass flux surface water
Access and Sample Collection	All surface water locations were accessible and able to be sampled, with the following exceptions: • March 2024 end of wet season sampling event – SW156 was not sampled due to the location being dry • April 2024 mass flux surface water sampling event – SW300 and SW312 was not sampled due to the locations being dry
Field observations	The following observations were noted in the surface water sampling events and is to be noted that said observations are qualitative descriptions. The water conditions and descriptions are presented in **Appendix B, Appendix C** and **Table 2**: December 2023 start of wet season and mass flux surface water: • SW106, SW108, SW115, SW124, SW125, SW143 and SW168 reported moderate turbidity • SW132 reported high turbidity • SW143 reported an organic sheen January 2024 mass flux surface water: • SW109 reported moderate turbidity • SW300 reported high turbidity February 2024 mass flux surface water: • SW312 reported moderate turbidity • SW300 reported high turbidity March 2024 end of wet season and mass flux surface water: • SW109, SW312, SW108, SW115, SW120, SW143, SW152, SW162 reported moderate turbidity • SW104, SW106, SW109, SW112, SW113, SW114, SW124, SW125, SW132, SW133, SW160, SW168, SW181, SW300, SW312 reported high turbidity • SW152, SW162 and SW170 reported an organic sheen April 2024 mass flux surface water: • SW109 and SW170 reported high turbidity
Surface water flow	Rapid Creek system generally had high flows with low turbidity and no sheen. On-Base drainage areas varied with pooled water to moderate flow from recent precipitation with low to moderate turbidity. DIA drainage systems had moderate flow and moderate turbidity. All other peripheral sampling locations, being coastal, were sampled during outgoing tides, that were characterised with moderate flow and relatively high salinity.

Compound	Criteria
Water quality measurements	Surface water quality measurements were measured after the collection of surface water samples. The stabilised readings are presented in **Table 2** in **Appendix B**, and are summarised below: December start of wet season and mass flux surface water: • DO ranged from 1.57 mg/L (SW160) to 10.35 mg/L (SW125) indicating hypoxic to oxygenated conditions • EC ranged from 9.5 µS/cm (SW181) to 580.27 µS/cm (SW124) indicating freshwater conditions • pH ranged from 4.75 (SW274) to 9.16 (SW125 and SW300) indicating slightly acidic to alkaline conditions • Redox (corrected) ranged from 202.6 mV (SW114) to 323.6 mV (SW300), indicating oxidising conditions. January mass flux surface water: • DO ranged from 74.9 mg/L (SW170) to 113.6 mg/L (SW109) indicating well oxygenated conditions • EC ranged from 52.3 µS/cm (SW170) to 113.9 µS/cm (SW300) indicating freshwater conditions • pH ranged from 6.8 (SW170) to 7.6 (SW109) indicating neutral conditions • Redox (corrected) ranged from 256.6 mV (SW109) to 293.3 mV (SW170), indicating oxidising conditions. February mass flux surface water: • DO ranged from 4.1 mg/L (SW300) to 5.67 mg/L (SW312) indicating oxygenated conditions • EC ranged from 30.4 µS/cm (SW312) to 53.1 µS/cm (SW300) indicating freshwater conditions • pH ranged from 5.81 (SW170) to 7.96 (SW312) indicating slightly acidic to neutral conditions • Redox readings were unable to be correctly recorded due to a water quality meter malfunction. March end of wet season and mass flux surface water: • DO ranged from 0.53 mg/L (SW160) to 5.16mg/L (SW112) indicating oxygenated conditions • EC ranged from 27.6 µS/cm (SW312) to 42,836 µS/cm (SW124) indicating freshwater to brackish conditions • pH ranged from 5.38 (SW168) to 8.5 (SW125) indicating slightly acidic to slightly alkaline conditions • Redox (corrected) ranged from 291.1 mV (SW109) to 380.2 mV (SW124), indicating oxidising conditions. April mass flux surface water: • DO for SW109 was 2.48 mg/L indicating oxygenated conditions • EC ranged from 49.3 µS/cm (SW109) to 83.6 µS/cm (SW170) indicating freshwater conditions • pH ranged from 4.82 (SW170) to 5.81 (SW109) indicating slightly acidic conditions • Redox (corrected) ranged from 357.6 mV (SW109) to 372.4 mV (SW170), indicating oxidising conditions.

4.3.2 PFAS surface water analytical results

The PFAS surface water analytical results from all sampling events are presents in **Appendix B, Table 3** and spatially on **Figure 2** in **Appendix A**.

December start of wet season and mass flux surface water:

During the December 2023 'start of wet season' and mass flux surface water sampling event, 20 of 24 sampled locations reported Sum of PFHxS and PFOS concentrations above the laboratory LOR. No samples for Sum of PFHxS and PFOS concentrations were reported above the *PFAS NEMP 2020 Recreational Water* guideline (HEPA, 2020). All surface water samples reported PFOS concentrations above the adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020). All samples also reported above the laboratory LOR, excluding SW114, SW115, SW124, SW178. However, the potential exists for PFOS concentrations to be above the adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020) but below the laboratory LOR for the above surface water samples.

There were no first-time detections or new exceedances at any surface water monitoring locations.

January mass flux surface water:

During the January 2024 mass flux surface water sampling event, three (SW109, SW170 and SW312) of four sampled locations reported Sum of PFHxS and PFOS concentrations above the laboratory LOR. All locations reported Sum of PFHxS and PFOS concentrations below the *PFAS NEMP 2020 Recreational Water guideline* (HEPA, 2020). The same three locations reported PFOS concentrations above the laboratory LOR and adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020).The potential exists for PFOS concentrations to be above the adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020) but below the laboratory LOR for SW300.

All locations within this sampling round reported PFOA concentrations below the laboratory LOR and adopted human health and ecological protection guidelines (HEPA, 2020).

There were no first-time detections or new exceedances at any surface water monitoring locations.

February mass flux surface water:

During the February 2024 mass flux surface water sampling event, all (SW109, SW170, SW300 and SW312) four sampled locations reported Sum of PFHxS and PFOS concentrations above the laboratory LOR, but below the *PFAS NEMP 2020 Recreational Water* guideline (HEPA, 2020). All locations reported PFOS concentrations above the laboratory LOR and adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020).

SW170 and SW300 reported PFOA concentrations above the laboratory LOR but below the adopted human health and ecological guidelines (HEPA, 2020).

There were no first-time detections or new exceedances at any surface water monitoring locations.

March end of wet season and mass flux surface water:

During the March 2024 'end of wet season' and mass flux surface water sampling event, 22 of 23 sampled locations reported Sum of PFHxS and PFOS concentrations above the laboratory LOR (HEPA, 2020). Four locations (SW104, SW114, SW125, SW312) reported Sum of PFHxS and PFOS concentrations above the *PFAS NEMP 2020 Recreational Water* guideline (HEPA, 2020).

The same 22 locations reported PFOS concentrations above the laboratory LOR and adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020).The potential exists for PFOS concentrations to be above the adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020) but below the laboratory LOR for SW115.

SW104, SW106, SW108, SW109, SW112, SW114, SW120, SW125, SW168, SW300 and SW312 reported PFOA concentrations above the laboratory LOR but below the adopted human health and ecological guidelines (HEPA, 2020).

There were no first-time detections or new exceedances at any surface water monitoring locations.

April mass flux surface water:

During the April mass flux surface water sampling event, SW109 and SW170 reported Sum of PFHxS and PFOS concentrations above the laboratory LOR but below the *PFAS NEMP 2020 Recreational Water* guideline (HEPA, 2020). All locations reported PFOS concentrations above the laboratory LOR and adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020).

SW109 reported PFOA concentrations above the laboratory LOR but below the adopted human health and ecological guidelines (HEPA, 2020).

There were no first-time detections or new exceedances at any surface water monitoring locations.

4.4 Groundwater

4.4.1 Field observations and field measurements

Field data was collected on data forms and the data was uploaded into ESdat for development of report tables. Field data tables are presented in **Table 4** in **Appendix B.**

Table 14 Groundwater observations and field measurements

Item	Observations and field measurements
Fieldwork Dates	The groundwater sampling event was completed on 4 and 5 March 2024 and 19 and 20 March 2024.
Access and Sample Collection	All monitoring wells and bores were accessible and able to be sampled with the exception of the following: • MW422 was not sampled due to being decommissioned during the PFAS post remediation works. Monitoring well MW502 was sampled in lieu. • MW112 was not sampled due to being suspected of being destroyed during the taxiway upgrades.
Monitoring Well Network Condition	The monitoring well network (refer to **Figure 3**) was generally in good condition.
Field Observations	Monitoring wells MW241 and MW297 was observed to emit a strong hydrocarbon odour.
Depth to Groundwater and flow direction	Depth to groundwater was recorded from 31 of 33 groundwater wells visited, ranging from 0.473 (MW185) to 6.98 (MW144) mbtoc. Groundwater elevations in the aquifer were between 4.99 (MW210) and 29.37 (MW139) metres Australian Height Datum (mAHD). Groundwater gauging data is presented in **Table 4** in **Appendix B.** Inferred groundwater contours and groundwater flow directions at the Base in March 2024 are shown on **Figure 4** in **Appendix A**. A localised high point is located in the central portion of the Base with groundwater flows radiating outwards from this area.
Geochemical parameters	Groundwater geochemical parameters were measured during sample collection from the HydraSleeve™ using a sterilised YSI cup and YSI Pro Water Quality Meter. The readings are presented in **Table 4** in **Appendix B**, and YSI calibration certificate in **Appendix G** and are summarised below: • DO ranged from 0.95 mg/L (MW297) to 5.28 mg/L (MW180) indicating hypoxic to oxygenated conditions • EC ranged from 2.1 µS/cm (MW211) to 1,622 µS/cm (MW209) indicating freshwater • pH ranged from 4.66 (MW115) to 6.33 (MW451), indicating slightly acidic to neutral conditions. • ORP (corrected) ranged from 213.6 mV (MW297) to 395.9 mV (MW141) indicating oxidising conditions.

4.4.2 PFAS groundwater analytical results

The PFAS groundwater analytical results from the March 2024 sampling event are presented in **Table 5** in **Appendix B.**

During the March 2024 biannual end of wet season groundwater sampling event, 32 of 33 sampled locations (all but MW209 located to the southwest of the Base) reported Sum of PFHxS and PFOS concentrations above the laboratory LOR and above the *PFAS NEMP 2020 Drinking Water* guideline (HEPA, 2020).

The same 32 locations reported PFOS concentrations above the laboratory LOR and adopted *PFAS NEMP 2020 Drinking Water* guideline (HEPA, 2020).The potential exists for PFOS concentrations to be above the adopted *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020) but below the laboratory LOR for sample MW209.

21 out of 33 groundwater samples reported PFOA concentrations above the laboratory LOR. Six samples (MW133, MW240, MW241, MW303 and MW453) reported PFOA above *PFAS NEMP 2020 Drinking Water* guideline. No groundwater samples reported PFOA above the *PFAS NEMP 2020 Freshwater 99%* guideline (HEPA, 2020).

There were no first-time detections or new exceedances at any groundwater monitoring locations.

5.0 Summary and next sampling events

5.1 Summary of monitoring event

Sampling for the PFAS OMP during the reported monitoring period included:

- Annual sampling of biota from Rapid and Ludmilla Creeks for biota species. Biota sampling was conducted in October 2023.
- Start of wet season surface water sampling in December 2023 from 24 of 24 sampling locations in December 2023.
- Biannual groundwater sampling of 33 of 34 planned monitoring wells (or designated alternatives) in March 2024, as MW112 is suspected to have been destroyed during the taxiway upgrade.
- End of wet season surface water sampling from 23 of 24 planned sampling locations in March 2024 as SW156 presented as dry.
- Monthly in wet season collection of surface water samples from four of four planned locations for the Base-wide Mass Flux PFAS Investigation from December 2023 to March 2024. Two of four planned locations were sampled in April, where SW300 and SW312 presented as dry.

The findings of the sampling events and the recommended actions are summarised in **Table 15** below.

Table 15 Summary of Sampling Event

Item	Comment	Recommended actions
Access to sampling locations	Majority of monitoring locations were accessible during the sampling events. The missed locations are as follows: - SW156 presented as dry during the March 2024 sampling event - MW112 is suspected to have been destroyed during the runway upgrades during 2023. - MW422 was decommissioned before the sampling event and replaced with newly installed MW502. AECOM was informed by the Lead Consultant that MW502 has replaced MW422 and was considered suitable for use in PFAS OMP reporting.	Continue monitoring in accordance with the SAQP and PMAP. It is recommended that MW502 is continued to be sampled in lieu of decommissioned groundwater monitoring well MW422. OMP update recommendations should be addressed through the OMR and by the LC. An evaluation of monitoring location MW112 should be conducted after completion of runway upgrade works to determine if the well is still accessible or if replacement of the well is required.
First-time detection of PFHxS+PFOS or PFOA in groundwater and surface water	None	Continue monitoring in accordance with the SAQP and PMAP.

Item	Comment	Recommended actions
New exceedance of NEMP 2.0 (HEPA, 2020) drinking water guideline values in groundwater	None	Continue monitoring in accordance with the SAQP and PMAP.
New exceedance of NEMP 2.0 (HEPA, 2020) recreational water guideline values in surface water	None	Continue monitoring in accordance with the SAQP and PMAP.
New exceedance of NEMP 2.0 (HEPA, 2020) ecological water guideline value for surface water	None	Continue monitoring in accordance with the SAQP and PMAP.
Sum of PFHxS+PFOS and/or sum of PFAS concentrations show an increasing trend in groundwater and surface water.	This will be evaluated in the next ongoing monitoring report.	Continue monitoring in accordance with the SAQP and PMAP.
Sum of PFHxS+PFOS and/or sum of PFAS concentrations show a decreasing trend in groundwater and surface water	This will be evaluated in the next ongoing monitoring report.	Continue monitoring in accordance with the SAQP and PMAP.

5.2 Upcoming sampling events

The next surface water sampling event will be the June 2024 mass flux surface water sample collection from Rapid Creek (SW109).

The next annual ongoing monitoring report will be completed in third quarter of 2024.

Notes:
* - Location both in start/end of wet season event and mass flux
Parameters failed to save for December locations, SW109, SW112 and SW113 due to electronic logging failure
February mass flux redox measurements were unable to be collected accurately due to a water quality meter malfunction.
SW156 presented dry in March 2024
SW300 and SW312 presented dry in April 2024
mg/L: milligram per Litre
µS/cm: microsiemens per centimetre
mV: millivolts
°C: degrees celcius

Notes:
µg/L: micrograms per litre
LOR: limit of reporting
* LOR is above guideline value
^ Surface water mass flux location
Denotes first time detection above LOR for Sum of PFHxS+PFOS or PFOA
Denotes new exceedance of human health screening criteria

FQM - Daily Activity Report

Q4AN(EV)-002-FM1

Project Name:	OMP / WQMP	**Project Number:**	60612561 [redacted]
Project Location:	RAAF Base Darwin	**Client:**	DoD [redacted]
Date of Fieldwork:	6/12/2023	**PM Name:**	[redacted]
Time Arrive:		**Time Depart:**	

Administration

Personnel On-Site:	[redacted]
Contractors (Inducted, Downtime):	

Tasks Undertaken

Describe tasks and time of activities undertaken, observations, communications with PM, clients and subcontractors etc.

☐ Cross out unused portions of the site notes ☐ Indicate QAQC samples collected & note on tracking sheet

☐ Record number waste drums transported on & off-site ☐ Indicate observations of on-Site environmental receptors

Indicate Weather Conditions:

06:30 mobilisation
08:15 Sampled SW133.1 SW132
QC100 / QC200 taken at SW133.
9.29 - SW143.
9.00am - SW124
9.35 - SW125.
9.50 - SW113.
10:10 - SW112.
10:40 - SW114 unable to sample due to it being dry
11:00 - SW104 no water - cant sample
11:15 - SW115 collected
11:31 - SW106 collected
11:51 - SW274 dry
12:13 - SW165 collected
13:10 - SW109 & SW286 - WQMP QC100+200+500
completed QC300, QC400 & QC500 for OMP 1300
completed QC 300 QC400 & QC55 for WQMP 1230
- SW285 (WQMP) dry.
- On base & signed key out 5.15.
- SW162 dry & SW271
- SW277 dry - SW177 dry. - SW178 dry.
- SW270 dry. - SW312 dry.
- Remainder sites dry
- Dropped S.F off & filled up.

HSE Actions

Describe any HSE actions or oberservations or additional information that is not recorded in the HSEP

- Contaminants
- Dehydration
- Fauna / Flora
- Public
- Dogs

Approval and Distribution

Project Name:	DWN OMP	**Project Number:**	
Project Location:	DWN RAF.	**Client:**	Ventia
Date of Fieldwork:	14.12.23 / 15.12.23	**PM Name:**	JG
Time Arrive:		**Time Depart:**	

Administration

Personnel On-Site: [redacted]

Contractors (Inducted, Downtime):

Tasks Undertaken

Describe tasks and time of activities undertaken, observations, communications with PM, clients and subcontractors etc.

☐Cross out unused portions of the site notes ☐ Indicate QAQC samples collected & note on tracking sheet

☐ Record number waste drums transported on & off-site ☐ Indicate observations of on-Site environmental receptors

Indicate Weather Conditions:

6.30 - toolbox - safety checks.
- checked SW27S dry.
- 7.30 got SW152 key
- 7.45 - SW152 sampled
- 8.30 - SW160
- 9.30 - SW156 - long puddle near spot
- looked for puddles at SW27S.
- office - 10.30 - sorted QC's and COC's.
- 12.00 dropped @ lab
- looked for puddle @ SW27S dry.
- went back 17.30 dry.

15.12.23

5.30am got SAMPLE @ SW27S

HSE Actions

Describe any HSE actions or oberservations or additional information that is not recorded in the HSEP

Q4AN(EV)-002-FM1

Project Name:	RFASoMP SW Mass Flux	**Project Number:**	60612561
Project Location:	Darwin	**Client:**	DoD
Date of Fieldwork:	24/01/24	**PM Name:**	[redacted]
Time Arrive:	10:30	**Time Depart:**	

Administration

Personnel On-Site:	[redacted]
Contractors (Inducted, Downtime):	

Tasks Undertaken

Describe tasks and time of activities undertaken, observations, communications with PM, clients and subcontractors etc.

☐ Cross out unused portions of the site notes ☐ Indicate QAQC samples collected & note on tracking sheet

☐ Record number waste drums transported on & off-site ☐ Indicate observations of on-Site environmental receptors

Indicate Weather Conditions:

- Mobilisation to SW500 at 10:30
- SW109 @ 11:15
- SW312 @ 11:50
- SW170 @ 12:15
- Demobilisation to grab ice lunch & drop samples off at lab.

HSE Actions

Describe any HSE actions or oberservations or additional information that is not recorded in the HSEP

- General public
- Rain
- Motor vehicles

☐ Cross out unused portions of the site notes

☐ Record number waste drums transported on & off-site

☐ Indicate QAQC samples collected & note on tracking sheet

☐ Indicate observations of on-Site environmental receptors

Indicate Weather Conditions:

- packed car of equip. 8:30am
- left Darwin office @ 9am to refuel
- 9:15am arrived @ SW30C
- 9:45am SW109
- SW109 = high flow, colourless, no odour, no sheen
- 10am heading to base to sign visitor in
- 10:30am Sampled SW312. No flow
- 10:45am sampled SW170. No flow, collected QC100 & QC200 here
- Signed off base, collected ice & dropped samples off,
- Back to office to decon equipment

HSE Aspects

Describe any HSE actions or oberservations or additional information that is not recorded in the HSEP

- Motor vehicles
- Hydration - Humidity is high

AECOM

Pre-Start Meeting Record

S4AN-700-FM1

Project Name:	PFAS EMP
Meeting Location:	Darwin
Meeting Date:	15/02/24
Supervisor's Name:	[redacted] Signature: [redacted]

Items Raised at Previous Pre-Start Meeting Addressed	Action By	Date
(Discuss results from yesterday's pre-start & site inspection(s), any outstanding issues?)		
○ Fauna - Spiders in gates		

Activities Occurring Today	Action By	Date
(Write down the activities that are occurring today & discuss how risks will be managed)		
○ L+ SW mass flux		

Risk assessments (SHEMP, SWMS, etc.) confirmed as current, specific & signed?

☑ YES

☐ NO (If no, review & update).

General Issues	Action By	Date
Discuss general issues here e.g. interface/environmental)		
○ Hydration		
○ Traffic management		

Items Raised by Team Members	Action By	Date
Write any additional issues raised by project team, consider Step Back Cards, hazard reports, observations, external events here)		
○ Being mindful of water vehicles		

Pre-Start Meeting Checklist for work today:

☑ Permits in place for activities	☑ MSDS available for all substances	☑ Weather forecast reviewed
☑ All workers site inducted	☑ PPE available & checked fit for purpose	☑ New workers/visitors identified
☑ Step Back Cards available	☑ First Aiders & Evacuation point identified	☑ All plant & equipment checked

Data Validation Reports

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60612561 - PFASOMP	**Date:**	23/01/2024
Site:	1302 – RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney & NMI	**Date:**	
Lab reference:	ES2342430, ES2343471, RN1414076, RN1415182, RN141793		

Key Findings:

The surface water analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The potential exists for concentrations of PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L), but below the laboratory LOR (0.01 µg/L) in all primary samples excluding 1302_SW124_231206, 1302_SW115_231206, 1302_SW124_231206 and 1302_SW178_231213.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control (QAQC)		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times			✓	1	No
Frequency of laboratory QA/QC			✓	2	No
Limits of reporting (LOR)			✓	3	No
Blank analysis	Field blank		✓	4	No
	Rinsate blank		✓	5	No
	Trip blank	✓			No
	Method blank	✓			No
Field intra-laboratory relative percent differences (RPDs)		✓			No
Field inter-laboratory RPDs		✓			No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries		✓			No
Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other observations		✓			No

Comments

1. Sample handling/preservation/ holding times

Handling/preservation

Laboratory batches were received outside of the recommended temperature range (≤6°C):

Batch Number	Temperature (°C)
ES2342430	20.2
ES2343471	8.8

Potential under reporting must be taken into consideration. However, due to the nature of PFAS not being volatile, that all samples were received below ambient groundwater temperature at the time of sampling (~30 °C), the samples were immediately cooled upon collection, and lastly that the primary and inter-laboratory RPDs were collected at the required frequency and generally within control limits, the potential for under reporting is not considered to materially affect the interpretation of results.

2. Frequency of laboratory QA/QC

Laboratory duplicate samples were not reported for Per- and Polyfluoroalkyl Substances (PFAS) in the primary lab batches ES2342430 and ES2343471. The precision of the data can be assessed as acceptable based on intra- and interlaboratory duplicate RPDs which were reported at the required frequencies and generally within control limits.

Matrix spikes were not reported at the required frequencies for per- and Polyfluoroalkyl Substances (PFAS) in the primary batch ES2342430. he precision of the data can be assessed as acceptable based on intra- and interlaboratory duplicate RPDs which were reported at the required frequencies and generally within control limits.

3.	Limits of Reporting	Limits of reporting were sufficiently low to enable assessment against adopted guideline criteria (NEMP 2020 guidelines), with the exception of PFOS against the freshwater species protection guideline value (99%). The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR for all primary samples excluding 1302_SW124_231206, 1302_SW115_231206, 1302_SW124_231206 and 1302_SW178_231213.
4.	Field Blank	As per project specifications, field blanks were collected at a rate of one per sampling date for all sampling days, with the exception of the following: - 15 December 2023 As concentrations were reported below the LOR in the available field blanks and rinsate blank samples, as well as the nature of PFAS not being volatile, cross contamination via volatilization during sampling is assessed to not have occurred.
5.	Rinsate Blank	As per project specifications, rinsate blanks were collected at a rate of one per sampling date for all sampling days with the exception of the following: - 15 December 2023 The decontamination methods are assessed as acceptable and the potential for cross contamination via sampling methods is considered unlikely based on the following: - All sampling equipment was either dedicated, disposable or decontaminated with a solution of water and Liquinox between sampling locations. - Dedicated water containers and clean disposable gloves were used to collect each sample. - The decontamination methods and field staff were consistent over the course of the sampling events - Concentrations of all analytes were reported below the LOR in the rinsate samples analysed.

*RPDs have only been considered where a concentration is greater than 1 times the EQL
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 200 (1-10 x EQL); 50 (10-20 x EQL); 30 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Surrogate % recoveries		✓			No
Other observations		✓			

Comments	
1. Sample handling /preservation /holding times	Laboratory batches were received outside of the recommended temperature range (≤6°C): <table><tr><th>Batch Number</th><th>Temperature (°C)</th></tr><tr><td>ES2404842</td><td>27.0 °C</td></tr><tr><td>RN1420031</td><td>Chilled</td></tr></table> Potential under reporting must be taken into consideration. However, the potential for under reporting is not considered to materially affect the interpretation of results due to the nature of Per- and Polyfluoroalkyl Substances (PFAS) not degrading via volatilisation, that all samples were received below ambient groundwater temperature at the time of sampling (~30 °C) and that the samples were immediately cooled upon collection.
2. Frequency of laboratory QA/QC	Laboratory duplicate samples were not reported for PFAS in the primary batch ES2404842. The precision of the data can be assessed as acceptable based on intra- and inter-laboratory duplicate RPDs which were reported at the required frequency and generally within control limits. Matrix spikes were not reported for PFAS in the primary batch ES2404842. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits).
3. Limits of Reporting (LOR)	Limits of reporting were sufficiently low to enable assessment against adopted guideline criteria, with the exception of PFOS. The potential exists for concentrations of PFOS to be below the LOR, but above the 99% freshwater ecosystem species guideline. As all primary samples reported concentrations of PFOS above the LOR, hence above the adopted guideline value, this is not expected to affect the interpretation of results.

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60612561	**Date:**	07/02/2024
Site:	RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney & NMI Sydney	**Date:**	07/02/2024
Lab reference:	ES2402439; RN1417898		

Key Findings:

The surface water analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The potential exists for concentrations of PFOS to be below the LOR, but above the guideline in samples 1302_SW300_240124 and should be taken into consideration when interpreting results.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control (QAQC)		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times			✓	1	No
Frequency of laboratory QA/QC		✓			No
Limits of reporting (LOR)			✓	2	No

	Method blank	✓			No
Field intra-laboratory relative percent differences (RPDs)		✓			No
Field inter-laboratory RPDs		✓			No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries		✓			No
Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other observations		✓		NA	

Comments	
1. Sample handling/preservation/holding times	Laboratory batches were received outside of the recommended temperature range (≤6°C):

Batch Number	Temperature (°C)
ES2402439	8.7 °C
RN1417898	Chilled

Potential under reporting must be taken into consideration. However, the potential for under reporting is not considered to materially affect the interpretation of results due to the nature of PFAS not degrading via volatilisation, the samples were received below ambient surface water temperature at the time of sampling (25.8 °C) and the samples were immediately cooled upon collection.

2. Limits of Reporting (LOR)

Limits of reporting were sufficiently low to enable assessment against adopted guideline criteria, with the exception of PFOS in the primary batch. The potential exists for concentrations of PFOS to be below the LOR, but above the 99% freshwater ecosystem species guideline in 1302_SW300_240124 and should be taken into consideration when interpreting results.

Key Findings:

The groundwater and surface water analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The potential exists for concentrations of PFOS to be above the adopted guideline, but below the laboratory LOR for primary samples 1302_MW209_240305. This should be taken into consideration when interpreting data and using data quantitatively.
- Elevated RPDs should be taken into consideration when interpreting concentrations for PFOS close to guidelines.

DATA VALIDATION REPORT; WATER

Project Manager:	James Guzman	**Validation by:**	Jordan Brookes
Project number:	60612561	**Date:**	20/03/2024
Site:	1302- RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	Kim Treglown
Laboratory:	ALS Sydney & NMI	**Date:**	13/05/2024
Lab reference:	ES2407635, ES2407639, ES2409473, RN1422100, RN1422105, RN1424007		

1.	Frequency of field quality assurance/quality control (QAQC)	As per project specifications, rinsate blank samples were analysed at a frequency of one per day, with the exception of 4 March 2024. The decontamination methods for this field date are assessed as acceptable and the potential for cross-contamination via sampling methods is considered unlikely based on the following: • All sampling equipment was either dedicated, disposable or decontaminated with a solution of water and Decon 90 between sampling locations • Dedicated sample bottles and clean disposable gloves were used to collect each sample • The decontamination methods and field staff were consistent over the course of the sampling event • Concentrations of all analytes were reported below the LOR in the rinsate samples analysed • Laboratory results are consistent with field observations and no evidence of cross-contamination is apparent.
2.	Sample handling/preservation/holding times	**Sample Preservation** The sample receipt temperatures were outside of the recommended range (≤6°C) for primary laboratory batches ES2407635 (16.3-16.6°C), ES2407639 (16.3-16.6°C) and ES2409473 (7.8°C). The secondary laboratory batches were noted to be received as 'chilled'. Potential under-reporting must be taken into consideration. However, as samples were received well below the ambient groundwater temperature at the time of sampling (~30 °C) and the samples were immediately cooled upon collection, the potential for under-reporting is not considered to materially affect the interpretation of results.
3.	Frequency of laboratory QA/QC	Laboratory duplicate samples were not reported in primary batch ES2407635 and not reported at the required frequency in primary batch ES2407639 for PFAS. The precision of the data can be assessed as acceptable based on intra- and inter-laboratory duplicate RPDs (which were reported at the required frequencies and within control limits, with the exceptions listed in Comment 4 below), and where available laboratory duplicate RPDs for the same analytical method group (which were reported within control limits). Matrix spikes were not reported in primary batch ES2407635 and not reported at the required frequency in primary batch ES2407639 for PFAS method group. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits, with the exceptions listed in Comment 4 below), and where available matrix spike recoveries for the same analytical method group (which were reported within control limits).

DATA VALIDATION REPORT; WATER

Project Manager:	James Guzman	**Validation by:**	Jordan Brookes
Project number:	60612561	**Date:**	20/03/2024
Site:	1302- RAAF Base Darwin		
Matrix:	Water	**Data Verified by:**	Kim Treglown
Laboratory:	ALS Sydney & NMI	**Date:**	13/05/2024
Lab reference:	ES2407635, ES2407639, ES2409473, RN1422100, RN1422105, RN1424007		

4.	Limits of reporting (LOR)	Limits of reporting were sufficiently low to enable assessment against adopted guideline criteria, with the exception of PFOS in water. The potential exists for concentrations of PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L), but below the laboratory LOR. (0.01 µg/L) for 1302_MW209_240305 and 1302_SW115_240306. This should be taken into consideration when interpreting PFOS results against guidelines for the above listed samples.
5.	Field inter-laboratory relative percent differences (RPDs)	Field inter-laboratory duplicate RPDs for ES2407635 were reported within control limits, with the exception of the following, higher concentrations are in bold (as shown in the RPD table): • **1302_MW144_240305** & 1302_QC201_240305 for PFOS (35%) • **1302_MW303_240305** & 1302_QC202_240305 for PFHpS (53%) • **1302_MW303_240305** & 1302_QC202_240305 for PFHxA (58%) • **1302_MW303_240305** & 1302_QC202_240305 for PFPeS(42%) • **1302_MW303_240305** & 1302_QC202_240305 for PFOS (38%) • **1302_MW303_240305** & 1302_QC202_240305 for PFHxS (46%) • **1302_MW156_240305** & 1302_QC200_240320 for PFHxA (37%) • **1302_MW156_240305** & 1302_QC200_240320 for PFOS (86%) • **1302_MW156_240305** & 1302_QC200_240320 for PFHxS (73%) • **1302_SW114_240306** & 1302_QC202_240320 for PFOS (65%) As there are no adopted guideline values for Perfluoroheptane sulfonic acid (PFHpS), Perfluorohexanoic acid (PFHxA), Perfluoropentane sulfonic acid (PFPeS) and Perfluorohexane sulfonic acid (PFHxS), the elevated RPDs are not expected to affect the interpretation of results against guidelines. However, the elevated RPDs should be taken into consideration when using the data quantitatively. As all concentrations of PFOS (and the sum of PFHxS+PFOS), were reported well above or well below the adopted guidelines and/or LOR, the elevated RPDs are not considered to affect the interpretation of results against guidelines. However, the elevated RPD should be taken into consideration when using the data quantitatively. As a conservative approach, the higher concentration reported at 1302_MW144_240305, 1302_MW303_240305, 1302_MW156_240320 and 1302_SW114_240306 (primary samples result) should be used when interpreting results quantitatively.

Delivery Details

Mode of Delivery	: Undefined	Security Seal	: Not Available
No. of coolers/boxes	: 4	Temperature	: 1.4, 8.9, 5.8'C - Ice Bricks present
Receipt Detail	:	No. of samples received / analysed	: 59 / 59

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Samples QC201, QC202, QC203 and QC204 have been forwarded to NMI.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231: Poor matrix spike recovery due to matrix interferences(confirmed by re-analysis).
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X (Biota): ALS NATA accreditation for PFAS in Biota covers all Perfluoroalkyl Sulfonic Acids, Perfluoroalkyl Carboxylic Acids and (n:2) Fluorotelomer Sulfonic Acids in fish (whole and muscle), plants and vegetable matrices, with the exception PFBA (fish only), EtFOSA, MeFOSE, EtFOSE, MeFOSAA, EtFOSAA.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Project	: NT_1302_PFASOMP_23	Date Samples Received	: 31-Oct-2023
Order number	: 60612561/3.1	Date Analysis Commenced	: 07-Nov-2023
C-O-C number	: ----	Issue Date	: 01-Dec-2023
Sampler	: [redacted]		
Site	: ----		
Quote number	: SY/139/19 V3		
No. of samples received	: 59		
No. of samples analysed	: 59		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2337477**	Page	: 1 of 12
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_23	Date Samples Received	: 31-Oct-2023
Site	: ----	Issue Date	: 01-Dec-2023
Sampler	: [redacted]	No. of samples received	: 59
Order number	: 60612561/3.1	No. of samples analysed	: 59

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **BIOTA**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2337477--021	1302_BIOAFA335_231018	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2337477--040	1302_BIOAFA354_231025	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231C: Perfluoroalkyl Sulfonamides	ES2337477--002	1302_BIOAFA316_231017	**N-Ethyl perfluorooctane sulfonamide (EtFOSA)**	4151-50-2	75.6 %	81.6-144%	**Recovery less than lower data quality objective**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	8	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	8	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **BIOTA**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method	***Sample Date***	*Extraction / Preparation*			*Analysis*		
Container / *Client Sample ID(s)*		***Date extracted***	*Due for extraction*	*Evaluation*	***Date analysed***	*Due for analysis*	*Evaluation*

Matrix: **BIOTA**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **BIOTA**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
PFOS - Linear/Branched Speciation	EP231-PFOS-SP	BIOTA	In-house: Linear PFOS is determined by quantiation of the separate linear peak using linear PFOS. Branched PFOS is determined as the difference between total PFOS (determined using a mixed linear/branched standard) and linear PFOS.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	BIOTA	In-house: A sample extract is analysed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of biota which is then solvent extracted. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Prep-Preparation for Biota Analysis	* Biota-PP	BIOTA	A sample is prepared from whole or particular tissues/organs, identified, homogenised and the total weight of prepared sample recorded.
Sample Preparation for PFAS in Biota	EP231-PR	BIOTA	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of homogenised biota which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample 1302_SW108_231206 not received.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Positive results for samples #5 and #10 confirmed by re-analysis.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2342430**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_23	Date Samples Received	: 08-Dec-2023
Site	: NT_1302_PFASOMP_23	Issue Date	: 13-Dec-2023
Sampler	: [redacted]	No. of samples received	: 16
Order number	: 60612561	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	17	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / ***Container*** / Client Sample ID(s)		***Sample Date***	*Extraction / Preparation*			*Analysis*

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample 1302_QC200_231213 was forwarded to ALS Brisbane**
- **Sample ID 1302_QC201_231214 will be forwarded to NMI as per Client.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	18	5.56	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples analysed	: 8		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	[redacted]	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Sample 1302_QC200_240215 forwarded to NMI for analysis.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2404842**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_24	Date Samples Received	: 16-Feb-2024
Site	: NT_1302_SW_24	Issue Date	: 20-Feb-2024

Order number	: 60612561/4.1	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	14	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	14	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- [11/03/2024] This is an updated SRN which indicates the new sample ID as per client request, for this work order.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 29		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	[redacted]	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	2	34	5.88	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	34	2.94	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2414224**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	[redacted]
Project	: NT_1302_PFASOMP_24	Date Samples Received	: 02-May-2024
Site	: NT_1302_SW_24	Issue Date	: 08-May-2024

Order number	: 60612561/4.1	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (16/04/2024): This report has been amended following the request to report specific sample ES2409473002 on a separate COA, received from Tiane McQuire on 12/04/2024.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (16/04/2024): This report has been amended following the request to report specific sample ES2409473002 on a separate COA, received from Tiane McQuire on 12/04/2024.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples received	: 36		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2337724**	Page	: 1 of 8
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_23	Date Samples Received	: 02-Nov-2023
Site	: NT_1302_PFASOMP_23	Issue Date	: 08-Nov-2023
Sampler	: [redacted]	No. of samples received	: 36
Order number	: 60612561	No. of samples analysed	: 36

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
	0				
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	36	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	36	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples analysed	: 5		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Order number	: 60612561	No. of samples analysed	: 5

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- This is an updated SRN which indicates the the updated sample date for this work order.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **ES2407635**	Page	: 1 of 17
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Contact	: Loren Schiavon
Address	: [redacted]	Address	: [redacted]
Telephone	: ----	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_24	Date Samples Received	: 08-Mar-2024 13:30
Order number	: 60612561/4.1	Date Analysis Commenced	: 11-Mar-2024
C-O-C number	: 64466	Issue Date	: 12-Mar-2024 16:13
Sampler	: [redacted]		
Site	: NT_1302_PFASOMP_24		
Quote number	: SY/139/19 V3		
No. of samples received	: 34		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Sampler	: [redacted]		
Site	: NT_1302_PFASOMP_24		
Quote number	: SY/139/19 V3		
No. of samples received	: 34		
No. of samples analysed	: 34		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	[redacted]	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2407635**	Page	: 1 of 6
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	[redacted]	Telephone	: [redacted]
Project	: NT_1302_PFASOMP_24	Date Samples Received	: 08-Mar-2024
Site	: NT_1302_PFASOMP_24	Issue Date	: 12-Mar-2024
Sampler	: [redacted]	No. of samples received	: 34

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	34	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	34	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIVED CONDITION

Date samples received: 7-NOV-2023

Sample received in good order: Yes

NMI Quotation no. provided: 60612561/3.1

Client purchase order number: 60612561/3_1

Temperature of samples: Frozen

Comments:

Mode of Delivery:

Additional Terms and Conditions

Incomplete / unclear information about samples or required testing will delay the start of the analysis work.

If you require your Purchase Order (PO) number to be included on our invoice, please provide the number during sample submission and before the completion of work to avoid unnecessary delays and/or additional processing/handling fees.

Alterations to Client requirements requested after commencement of testing may incur charges.

The lodgement of an order or receipt of samples for NMI services referenced in this Sample Receipt Notification constitutes an acceptence of the current version of NMI Terms and Conditions or other applicable Terms referenced in the NMI Quotation. NMI Terms and Conditions are available on the web at https://www.industry.gov.au/client-services/testing-and-analysis-services/chemical-and-biological-analysis-services-terms-and-conditions

N23/023329
PFAS in biota is not NATA accredited.
Internal standard recoveries are outside the acceptable range of 50-150%
due to matrix intereference for: MeFOSA, EtFOSA, MeFOSE, EtFOSE.

N23/023330
PFAS in biota is not NATA accredited.
Internal standard recoveries are outside the acceptable range of 50-150%
due to matrix intereference for: MeFOSA, EtFOSA, MeFOSE, EtFOSE.

REPORT OF ANALYSIS

PFHxS and PFOS were quantified using combined branched and linear standards, for all PFAS linear and branched isomers in samples are totalled for reporting.

All results are reported on a wet weight basis as received, and are corrected for labelled internal standard recoveries.

Results relate only to the sample(s) as received and tested.

* Denotes the analyte or test method is not within our ISO/IEC 17025 scope of accreditation.

Measurement Uncertainty is available upon request.

N23/027027
PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.

REPORT OF ANALYSIS

Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N >10.

N24/003375
PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.ô

REPORT OF ANALYSIS

High PFAS surrogate recoveries accepted - results corrected for recovery.

REPORT OF ANALYSIS

PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.ô
High PFAS surrogate recoveries accepted - results corrected for recovery.
Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N >10.

REPORT OF ANALYSIS

PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

Selected PFAS surrogate recoveries are biased due to matrix effects.ô
High PFAS surrogate recoveries accepted - results corrected for recovery.

SAMPLE RECEIVED CONDITION

Date samples received:	27-MAR-2024
Sample received in good order:	Yes
NMI Quotation no. provided:	NT_1302_PFASOMP_24
Client purchase order number:	60612561_4_1
Temperature of samples:	Chilled
Comments:	
Mode of Delivery:	

Additional Terms and Conditions

Incomplete / unclear information about samples or required testing will delay the start of the analysis work

If you require your Purchase Order (PO) number to be included on our invoice, please provide the number during sample submission and before the completion of work to avoid unnecessary delays and/or additional processing/handling fees.

Alterations to Client requirements requested after commencement of testing may incur charges.

The lodgement of an order or receipt of samples for NMI services referenced in this Sample Receipt Notification constitutes an acceptence of the current version of NMI Terms and Conditions or other applicable Terms referenced in the NMI Quotation. NMI Terms and Conditions are available on the web at https://www.industry.gov.au/client-services/testing-and-analysis-services/chemical-and-biological-analysis-services-terms-and-conditions

Notes

mbtoc = meters below top of casing

mAHD = meters Australian Height Datum

DO = dissolved oxygen

EC = electrical conductivity

Eh = reduction oxidation

Temp = Temerature (degree centigade or ^{o}C)

NM = not measured

NR = not recorded

* = TDS values calculated by EC * 0.65

= MW502 first installed within the reporting period. No surveying data.

- = not recorded

Notes

mbtoc = meters below top of casing

mAHD = meters Australian Height Datum

DO = dissolved oxygen

EC = electrical conductivity

Eh = reduction oxidation

Temp = Temerature (degree centigade or ^{o}C)

NM = not measured

NR = not recorded

* = TDS values calculated by EC * 0.65

= MW502 first installed within the reporting period. No surveying data.

^ = Groundwater is not corrected for fuel density and has not been included in interpretting groundwater flow direction.

- = not recorded

Notes

mbtoc = meters below top of casing

mAHD = meters Australian Height Datum

DO = dissolved oxygen

EC = electrical conductivity

Eh = reduction oxidation

Temp = Temerature (degree centigade or ^{o}C)

NM = not measured

NR = not recorded

* = TDS values calculated by EC * 0.65

= MW502 first installed within the reporting period. No surveying data.

^ = Groundwater is not corrected for fuel density and has not been included in interpretting groundwater flow direction.

- = not recorded

Notes

DO = dissolved oxygen

EC = electrical conductivity

Redox = reduction oxidation

Temp = Temperature (°C)

^ = TDS values calculated by EC * 0.65

* = Location both in start/end of wet season event and mass flux

= Conversion made from DO% (Sat) to mg/L using USGS on-line calculator (https://water.usgs.gov/cgi-bin/dotables), BoM barometric pressure from 24/01/2024 and the machine reading for temperature and electrical conductivity.

- = not recorded

Notes

DO = dissolved oxygen

EC = electrical conductivity

Redox = reduction oxidation

Temp = Temperature (°C)

^ = TDS values calculated by EC * 0.65

* = Location both in start/end of wet season event and mass flux

= Conversion made from DO% (Sat) to mg/L using USGS on-line calculator (https://water.usgs.gov/cgi-bin/dotables), BoM barometric pressure from 24/01/2024 and the machine reading for temperature and electrical conductivity.

- = not recorded

APPENDIX F: LIMITATIONS

IMPORTANT INFORMATION ABOUT YOUR TETRA TECH COFFEY ENVIRONMENTAL REPORT

Introduction

This report has been prepared by Tetra Tech Coffey for you, as Tetra Tech Coffey's client, in accordance with our agreed purpose, scope, schedule and budget.

The report has been prepared using accepted procedures and practices of the consulting profession at the time it was prepared, and the opinions, recommendations and conclusions set out in the report are made in accordance with generally accepted principles and practices of that profession.

The report is based on information gained from environmental conditions (including assessment of some or all of soil, groundwater, vapour and surface water) and supplemented by reported data of the local area and professional experience. Assessment has been scoped with consideration to industry standards, regulations, guidelines and your specific requirements, including budget and timing. The characterisation of site conditions is an interpretation of information collected during assessment, in accordance with industry practice.

This interpretation is not a complete description of all material on or in the vicinity of the site, due to the inherent variation in spatial and temporal patterns of contaminant presence and impact in the natural environment. Tetra Tech Coffey may have also relied on data and other information provided by you and other qualified individuals in preparing this report. Tetra Tech Coffey has not verified the accuracy or completeness of such data or information except as otherwise stated in the report. For these reasons the report must be regarded as interpretative, in accordance with industry standards and practice, rather than being a definitive record.

Your report has been written for a specific purpose

Your report has been developed for a specific purpose as agreed by us and applies only to the site or area investigated. Unless otherwise stated in the report, this report cannot be applied to an adjacent site or area, nor can it be used when the nature of the specific purpose changes from that which we agreed.

For each purpose, a tailored approach to the assessment of potential soil and groundwater contamination is required. In most cases, a key objective is to identify, and if possible quantify, risks that both recognised and potential contamination pose in the context of the agreed purpose. Such risks may be financial (for example, clean up costs or constraints on site use) and/or physical (for example, potential health risks to users of the site or the general public).

Limitations of the Report

The work was conducted, and the report has been prepared, in response to an agreed purpose and scope, within time and budgetary constraints, and in reliance on certain data and information made available to Tetra Tech Coffey.

The analyses, evaluations, opinions and conclusions presented in this report are based on that purpose and scope, requirements, data or information, and they could change if such requirements or data are inaccurate or incomplete.

This report is valid as of the date of preparation. The condition of the site (including subsurface conditions) and extent or nature of contamination or other environmental hazards can change over time, as a result of either natural processes or human influence. Tetra Tech Coffey should be kept appraised of any such events and should be consulted for further investigations if any changes are noted, particularly during construction activities where excavations often reveal subsurface conditions.

In addition, advancements in professional practice regarding contaminated land and changes in applicable statues and/or guidelines may affect the validity of this report. Consequently, the currency of conclusions and recommendations in this report should be verified if you propose to use this report more than 6 months after its date of issue.

The report does not include the evaluation or assessment of potential geotechnical engineering constraints of the site.

Interpretation of factual data

Environmental site assessments identify actual conditions only at those points where samples are taken and on the date collected. Data derived from indirect field measurements, and sometimes other reports on the site, are interpreted by geologists, engineers or scientists to provide an opinion about overall site conditions, their likely impact with respect to the report purpose and recommended actions.

Variations in soil and groundwater conditions may occur between test or sample locations and actual conditions may differ from those inferred to exist. No environmental assessment program, no matter how comprehensive, can reveal all subsurface details and anomalies. Similarly, no professional, no matter how well qualified, can reveal what is hidden by earth, rock or changed through time.

The actual interface between different materials may be far more gradual or abrupt than assumed based on the facts obtained. Nothing can be done to change the actual site conditions which exist, but steps can be taken to reduce the impact of unexpected conditions.

For this reason, parties involved with land acquisition, management and/or redevelopment should retain the services of a suitably qualified and experienced environmental consultant through the development and use of the site to identify variances, conduct additional tests if required, and recommend solutions to unexpected conditions or other unrecognised features encountered on site. Tetra Tech Coffey would be pleased to assist with any investigation or advice in such circumstances.

Report for benefit of client

Unless otherwise agreed between us, the report has been prepared for your benefit and no other party. Other parties should not rely upon the report or the accuracy or completeness of any recommendation and should make their own enquiries and obtain independent advice in relation to such matters.

Tetra Tech Coffey assumes no responsibility and will not be liable to any other person or organisation for, or in relation to, any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report.

To avoid misuse of the information presented in your report, we recommend that Tetra Tech Coffey be consulted before the report is provided to another party who may not be familiar with the background and the purpose of the report. In particular, an environmental disclosure report for a property vendor may not be suitable for satisfying the needs of that property's purchaser. This report should not be applied for any purpose other than that stated in the report.

Interpretation by other professionals

Costly problems can occur when other professionals develop their plans based on misinterpretations of a report. To help avoid misinterpretations, a suitably qualified and experienced environmental consultant should be retained to explain the implications of the report to other professionals referring to the report and then review plans and specifications produced to see how other professionals have incorporated the report findings.

Given Tetra Tech Coffey prepared the report and has familiarity with the site, Tetra Tech Coffey is well placed to provide such assistance. If another party is engaged to interpret the recommendations of the report, there is a risk that the contents of the report may be misinterpreted and Tetra Tech Coffey disowns any responsibility for such misinterpretation.

Data should not be separated from the report

The report as a whole presents the findings of the site assessment and the report should not be copied in part or altered in any way. Logs, figures, laboratory data, drawings, etc. are customarily included in our reports and are developed by scientists or engineers based on their interpretation of field logs, field testing and laboratory evaluation of samples. This information should not under any circumstances be redrawn for inclusion in other documents or separated from the report in any way.

This report should be reproduced in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties.

Responsibility

Environmental reporting relies on interpretation of factual information using professional judgement and opinion and has a level of uncertainty attached to it, which is much less exact than other design disciplines. This has often resulted in claims being lodged against consultants, which are unfounded. As noted earlier, the recommendations and findings set out in this report should only be regarded as interpretive and should not be taken as accurate and complete information about all environmental media at all depths and locations across the site.
